The first act to control the liquor traffic in The Netherlands was introduced in 1881. It provided merely for a limitation in the number of licenses to be granted, but otherwise imposed no restrictions. In 1904 a new law was passed, providing for fewer saloons, higher license fees, heavier penalties for transgressions, and forfeiture of licenses by order of the municipality at any time after five years. The principal antiliqur societies are: The People's Union, Utrecht; the General Dutch Teetotalers' Union, Amsterdam; the Roman Catholic Union for Combating the Abuse of Alcohol, Maastricht; and many others.

Charitable and philanthropical work are of a private nature. Associations with different

Internal Communication

Colonies

Social Legislation

tendencies exist in nearly every locality: lecture-halls for workmen, food and clothing for children, dwellings for old servants, etc. Examples of these societies are the society "Charity According to Means" and "Meals for Children" at Amsterdam.

Among the associations with a general educational purpose the various Toynbee societies for university extension, especially in university towns, are most noteworthy. As to industrial education we may mention in the city of Amsterdam the Museum of Protective Appliances against danger in factories, where various provisions to prevent accidents can be seen. (See MUSEUMS OF SECURITY.) For the promotion of social education Amsterdam may boast of an Institute of Social Advice—an institute with a purpose similar to that of the American Institute of Social Service—and also of its Class for Education in Social Work.

Labor colonies, tho mainly penal, were early started in Holland.

They are of two kinds, penal and free, with three of each kind. The penal colonies are national workhouses, at Veenhuizen, Hoorn and Leyden. The first has 3,600 inmates in three establishments. The work is agriculture, gardening, hand-work, and light manufacturing.

The free colonies have some 1,500 members, including 150 "free farmers' families." They are aided by the State, contented, but not progressive. They cost the State about \$7.50 per year per head. The colonies save a few children, and afford a shelter for a few families, through fault or circumstance unable by themselves to make headway in the world, but do little more.

Cooperation in the form of production is poorly developed in Holland, and consumptive cooperation, tho more flourishing, is still in the beginning. Still we may mention as examples of productive cooperation of capital, several agricultural associations of farmers for the manufacture of butter and cheese; of agricultural labor, the Society Van Marken's Printing Works at Delft, where, after ten years of existence, the shares have become the property of labor in its different forms (management, hand labor, control). In consumptive cooperation the society "Self-Help" ("Eigen Hulp"), managing several grocery stores in The Hague, Amsterdam, and other cities, is the most prominent. The Cooperative Union, a society for propagating cooperative principles, for procuring information and the organizing of wholesale business and cooperative production on behalf of the cooperative societies, has, however, separated itself from the "Eigen Hulp." This opens the way for working men's cooperative societies to become members of the union. To this they were opposed till now, because they could not agree with the lines on which the "Eigen Hulp" worked.

There existed at the end of 1904, 114 distributive societies, 4 cooperative butcheries, 70 bakeries, 14 societies for the distribution of fuel, 227 societies for distributing manure, seeds, fodder, etc., 42 other distributive societies—8 productive tailoring societies, 2 boot and shoe societies, 1 cigar factory, 1 smithy (forge), 1 upholsterers' society, 504 cooperative creameries, 26 societies for the selling of agricultural products, 2 societies for the improvement of the breed of horses, 2 societies for the improvement of cattle, 2 societies of workmen in wooden shoes, 6 mills for preparing potato meal, 4 societies of beekeepers, 1 society of

oil makers, 1 society for the preparation of fodder, 1 beet-sugar mill, 2 societies for the use of steam-threshing machines, 4 straw pasteboard mills, 6 printing societies, 32 different productive societies, 309 people's banks, 4 life-insurance societies, 6 fire-insurance societies, 5 cattle-insurance societies, 9 societies for assistance in case of illness and inability, 143 building societies.

A large factory has made an experiment with small gardens for the children of working men.

There are, in The Netherlands, one post-office savings-bank and nearly 300 private savings-banks. The number of depositors per 1,000 inhabitants was 62 in 1890, and 200 in 1904; and the average amount deposited increased from 75 florins in 1890 to 106 fl. in 1904.

Trade-unionism in The Netherlands is characterized by its division into religious groups; and this is probably one of the main reasons why this movement is not very strongly developed. In 1905 there were 104 unions with about 1,600 local branches. The diamond-workers' union is the strongest of these bodies, embracing about 80 per cent of all the diamond-cutters in Amsterdam, this industry being confined to that city. Recent strikes are shown in the following table:

| YEAR | No. of strikes | Decided in working men's favor | In employers' favor | Ended without decision |
|------------|----------------|--------------------------------|---------------------|------------------------|
| 1902 | 128 | 48 | 42 | 27 |
| 1903 | 149 | 39 | 60 | 37 |
| 1904 | 85 | 22 | 34 | 25 |
| 1905 | 126 | 22 | 47 | 54 |

Socialism entered Holland in 1869, in connection with the International, but did not take permanent root. In 1878 a new Socialist movement sprang up largely under the lead of Domela Nieuwenhuis, a former Protestant clergyman. He

started the *Recht Voor Allen*, a Socialist paper, and a Social Democratic Union. In 1888 he was elected to the legislature and remained till 1891. But gradually becoming anarchistic or communistic, most of the Dutch Socialists broke away from him and the movement became divided. In 1889 a Social Democratic League was formed, and since then the Socialist movement has been conducted mainly on Marxist lines. Cooperation in connection with socialism, as in Belgium, has been attempted, but with small success. There were reported in 1905, 65,743 Socialist votes and fifty-two Socialist or Labor journals.

Some of the leading Dutch societies are: Centraal Bureau voor Sociale Adviezen, 37 Vossiusstraat, Amsterdam; Centraal Bureau voor de Statistiek, The Hague; Het Volk (Socialist organ), 117 Gelderschke Kade, Amsterdam; Jordaan (Working Men's Dwellings), The Hague; Tiedadigheid naas Vermogen (Charity According to Means), Amsterdam.

NEW HARMONY: Though later identified with Robert Owen (q. v.), this community was founded by a small German sect, the followers of one George Rapp, a weaver, noted for his biblical knowledge and piety. Rapp gathered together in Württemberg a number of people who

shared his religious views, and, following the example of the early Christians in Jerusalem, they held all their property in common.

Being persecuted for their views, they decided to emigrate to the United States, and in 1803 the Rappites formed their first settlement in Butler County, Pa., giving to their village the name of Harmony. By dint of hard work and economy, in ten years they were in a state of comparative comfort; but wishing to make their position more secure, in 1813 they moved westward and bought about 30,000 acres of some of the richest land in Posey County, Ind., and there founded the world-famous village of New Harmony. The Rappites were a very industrious and inoffensive folk; they creed enjoined pure life, simple diet, and plain dress; the ambitions and wishes of the individual were to be entirely subject to the general good. After a time they took vows of celibacy, even those who were already married dissolving the relationship and taking the vows. For ten years they labored and prospered exceedingly, both in agriculture and manufacture; and then, selling all their land and the village buildings to Mr. Robert Owen, of New Lanark, Scotland, they emigrated east again to Beaver County, Pa., where they founded the village of Economy. (See *ECONOMY*.)

The purchaser of New Harmony, Robert Owen (*q. v.*), was a Welshman, born in 1771. He became manager and then proprietor of extensive cotton-mills on the Clyde, Scotland, and devoted much energy to promoting the interest of working people. He desired to abolish all

Under Robert Owen class distinctions, and endeavored to show that the interests of the employer and employees could be made identical. His mills at New Lanark were ideal object lessons to support his theory, and it was to put into practical shape his theories for the advancement of working people that he bought the New Harmony estate. Associated with him in the scheme was a Mr. William Maclure, a Scotchman, who shared Mr. Owen's communist theories.

Their aim was to establish a community in which property was to be held in common, tho under the restriction of a constitution. All were to share in the common labor, and all should receive a liberal education, with facilities for continued study and pursuit of knowledge. The religious views of the members were entirely of their own choice, the only qualifications essential for membership being honesty of purpose, temperance, industry, cleanliness, and carefulness. When the settlement of New Harmony came into the possession of Robert Owen the village was regularly laid out as a town, with streets running at right angles to each other, and in the center a public square, surrounded by the large brick buildings built by the Rappites for their churches and schools. The land itself was well prepared; there were nineteen detached farms, and some 3,000 acres which had been cultivated by the Rappite society, besides a vineyard, several orchards, and other improvements. With the place so prepared, and 30,000 acres to fall back upon, the experiment of a secular community, based on honesty of purpose and moral integrity, seemed to have every material advantage that could be offered. In a very short time the village was a busy place. Within two or three months there were some 900 persons gathered from all parts of the U. S. and Europe. Many of these were inspired with an earnest belief in the ideals which the experiment was to prove, and worked zealously in the endeavor to put them into practice; but many, also, were lazy and shiftless and came seeking an easy mode of living, shirking their share of the toil, while others came with a view to making profit out of the benevolent feeling of the founder, and with no sympathy at all for the movement. With such material it was quite impossible to fulfil the original expectation, and in less than two years it had become evident that it was hopeless to try longer.

On April 27, 1825, Mr. Owen called all the members of the community together, and in an address explained the impossibility of an immediate total change in all their manners of life, and proposed that they should accept a constitution only partially communistic for a term of three years, that they might be better prepared to fully carry out the ideal community. This was agreed to, and under the name of the "Preliminary Society of New Harmony" the venture was formally

constituted. Mr. Owen then returned to Europe, and a committee managed the affairs of the society. In less than a year Mr. Owen returned to New Harmony, and soon after his return the members of the Preliminary Society held another convention, deciding to at once commence communism and adopting a constitution of a community which they called the "New Harmony Community of Equality." The management was to be in the hands of an executive council, who were to be subject to the direction of the community. Experience demonstrated that the plan of the executive council was not practicable, and the members were unanimous in requesting Mr. Owen to take the sole management. This was the inauguration of the most prosperous season in the short life of the community. There were soon no idlers, all being busily engaged; and the meetings, instead of being the scene of wrangles, were utilized for the benefit of all the members.

This was too good to last, and within a very few months there were disturbances, and attempts to divide the town into several societies. On May 30, 1826, in consequence of the continual disagreements which had arisen about the disposal of the property, a meeting of the whole of the population was held, at which it was decided to form four separate societies, each to purchase its own share of the property, and each to manage its own affairs, but to trade together by means of paper currency. Other changes followed fast, but each change left them no better than before. The trouble was not in the institutions so much as in the unpreparedness or greed of many of the members; and though there were many choice, noble spirits in the undertaking, they were overweighted by the others. After watching the spirit of the community depart, and his fondest hopes gradually crumble away, in June, 1827, Mr. Owen bade the community farewell. Leases were granted to such as desired to continue the cooperative experiments, and the some

Failure

smaller communities were formed from the wreckage, the New Harmony Community of Equality had become a thing of the past.

The effect, however, was not to die away. The scheme of communal cooperative life took a deep hold on the imaginations of the people, and many smaller communities were formed; and, when nearly fifteen years later Fourier's scheme was advocated, many were prepared to sink their all in the new communities which sprang up in all directions—and, alas! died away as rapidly as they came into existence. But with all the failures, there is still some gain, and the bitter disappointments of those who fondly imagined they were remodeling society are only the defeats which will help to insure victory later on, even tho it should not come as they expected it.

A. H.

NEWSPAPERS: Rowell's American Newspaper Directory for 1906 reported the number of newspapers published in the United States and Canada as 23,461. Of these, 1,135 were Canadian publications. The following was the frequency of issue: Weekly, 16,782; monthly, 2,960; daily, 2,465; semi-monthly, 287; semi-weekly, 588; quarterly, 195; bi-weekly, 57; bimonthly, 69; tri-weekly, 55—total, 23,461.

The *World Almanac* estimates the total number of newspapers published in the world at present

at about 60,000, distributed as follows: U. S. and Canada, 23,461; Germany, 8,049; Great Britain, 9,500; France, 6,681; Japan, 1,000; Italy, 2,757; Austria-Hungary, 2,958; Asia, exclusive of Japan, 1,000; Spain, 1,000; Russia, 1,000; Australia, 1,000; Greece, 130; Switzerland, 1,005; Holland, 980; Belgium, 956; all others, 1,000. Of these more than half are printed in the English language.

NEWTON, RICHARD HEBER, D.D.: Clergyman, author; born 1840 in Philadelphia, Pa.; educated in University of Pennsylvania and the Episcopal Divinity School at Philadelphia. Rector of All Souls' Church, New York City, for thirty-three years; he was one of the earliest to introduce Institutional Church features into church work, free evening classes, working men's clubs, free kindergartens, summer homes, etc., and one of the first ministers in New York to use the pulpit for instruction in the ethics of sociology. Dr. Newton is a Christian Socialist and has lectured much on behalf of social reform. He wrote the article on "Cooperation" in the American Supplement to the "Encyclopædia Britannica." Also "Social Studies," "Church and Creed," among many other books. Address: East Hampton, New York.

NEW YORK CITY (see also **NEW YORK CITY MONOPOLIES; CITIES (Statistics); LUXURY; CORRUPTION; TAMMANY; HOUSING; OVERCROWDING; SLUMS; TENEMENTS; LIQUOR TRAFFIC; PROSTITUTION**, and other special topics):

The story of reform in New York City has always been involved. From the discovery of Manhattan Island in 1609 by Hendrik Hudson, an Englishman in Dutch employ, New York City, originally called New Amsterdam, has always had a composite population. Even under the Dutch, New Amsterdam had many English and other peoples. It was mainly a commercial settlement and attracted from the start a few men of wealth and many lawless and dissolute. The people cared little at its conquest in 1664, by the English, without a gun being fired, nor later when it was recaptured by the Dutch and then handed back to England.

History

The policy of the Dutch governors in creating patroons or feudal lords and of the English governors in giving grants and concessions, early created an aristocracy, while the presence of adventurers, sailors, slaves, and others of all races early produced a population differing from modern poorer classes of New York mainly in numbers and in being more lawless. Many of the wealthy classes conducted privateer-

ing and made wealth thereby, even as the wealthy New Yorkers organize their trusts to-day. During the Revolution, New York City, being the headquarters of the British, became more Tory and more aristocratic than most of the cities in spite of the fact that New York had stood prominent in asserting the rights of the colonies, and that the Stamp Act Congress had met in New York. But New York was mainly commercial. In 1795 the Tammany Society was founded as a social and political club, to oppose the Federalists, but by 1800 was influential in carrying the state for Jefferson, and so creating the Democratic Party. The city's rapid growth and wealth and the doctrine preached by the Clintons, that to the victors belong the spoils, early interested the Tammany Society, commonly called Tammany Hall in city politics, especially after 1834, when for the first time the mayoralty became elective. The city was, however, to a large extent really ruled from Albany, the governors being principally from the old aristocratic families and chiefly interested in state politics with unusually varied and equal party interests, New York State being from the start the pivotal state in every close election. All this favored secret corruption in New York City, working among the masses with the connivance of the rich. By 1820 the city numbered 125,000 people. The invention of steamboats, the opening of the Erie Canal, immigration from Europe, aided commerce and developed a city of the rich and of the poor. New York's wealth became famous and "the bread riots" of 1837 show the presence of the poor. Tammany found its chance among the latter. Fernando Wood, one of its first bosses, was elected mayor. In 1850 street-railways were started and franchises were obtained by corruption. By 1860 New York had 800,000 inhabitants. During the Civil War New York was a Democratic city, with many Copperheads, and her commercial magnates were accused of making money out of the war. Nevertheless, there was much patriotism, and some notable manifestations of it. The Seventh Regiment was the first in the whole country to go to the front. But "draft riots" broke out; negroes were persecuted. Political corruption grew open, culminating in the Tweed Ring and the election of Oakey Hall in 1866. Stock-watering and stock-gambling also ran riot in Wall Street. But the better citizens rose in 1871 and exposed the Tweed Ring, and William M. Tweed and others were convicted and imprisoned. The *Times*, *Tribune*, *Herald*, and *Harper's Weekly* led in the fight. It was proved that the ring had stolen over \$20,000,000. Tweed escaped from jail to Spain, but was surrendered and died in jail (hospital) in 1878. Many movements for reform now began. Comstock incorporated his Society for the Suppression of Vice in 1873. Elbridge T. Gerry, his Society for the Prevention of Cruelty to Children in 1874. A Society for the Prevention of Crime was organized in 1876. In state politics S. J. Tilden largely purged the Democratic Party and was elected mayor in 1874. In New York City, however, a new Tammany boss appeared in "Honest" John Kelly. Tammany became wiser and more powerful. It nominated comparatively good mayors and developed its systematic aiding of the poor, but also systematized its corruption. Kelly ruled till his death in 1886. In 1884 the "boodlers" aldermen gave away the valuable Broadway franchises for a cash consideration (Broadway steals). Desire for radical reform became general. Henry George promulgated his ideas, and in 1886 was nominated polling 68,112 votes against Theodore Roosevelt's (Republican) 60,435, but Abram S. Hewitt (Democrat) was favored by Tammany and won with 90,555 votes. The Reform Club was founded in 1888 and a People's Municipal League, but Tammany won again in 1888, 1890, and 1892. In 1900 the Republican Legislature investigated the city, and the Senate did so in 1894 (Lexow investigation). In 1894 the Independents united with the Republicans and elected William L. Strong as mayor. Colonel George E. Waring was appointed head of the street-cleaning department and revolutionized it. Theodore Roosevelt was president of the police board and enforced the law. In 1897, however, Tammany again won, and elected Robert A. Van Wyck against Seth Low, nominee of the Citizens' Union. Henry George was nominated by the progressive Democrats, but died during the campaign. Mr. Croker, who had been boss of Tammany since 1886, was really in power. In 1898 the area of the city was widened to Greater New York. Another investigation (Mazet) was made in 1899. In 1901 the Citizens' Union elected Seth Low, polling 294,992 votes, tho the Democrats nominated Edward M. Shepard, who polled 265,328. Mr. Low gave a good administration, but was personally unmagmatic, and in 1903 George McClellan (Democratic) polled 314,728 votes to Mr. Low's 252,086. In 1905 William R. Hearst (G. v.), having formed a Municipal Ownership League, was nominated for mayor, and in the opinion of almost everybody was elected, but was counted out as having polled only 225,165 votes to McClellan's 228,651 and to Ivins's 137,049. Mr. Hearst has tried since to get a recount, but thus far has not succeeded.

In 1900 large attention was given to startling revelations as to the social evil and the betrayal of girls on the East Side (see **PROSTITUTION**), and many evil resorts were closed, tho the Raines

Law hotels, or hotels only nominally so to fulfil the law and gain a liquor license, were felt by many to be the main sources of evil, yet have largely been left untouched. The connection with the police and graft in disreputable houses was largely shown, but largely traceable to men higher up, as yet, however, unreached. Outwardly the law, however, is now more enforced. In 1904 considerable agitation was raised as to gambling, and District Attorney Jerome had many pool-rooms raided and closed up. (See GAMBLING.) Tammany, however, remains in power, and reform is mainly on the surface. (See CORRUPTION; TAMMANY.)

Recent years, with prosperity in business, have seen large immigration, much of it dumped in New York. The growth of the city has caused much speculation in land, notably on Long

Reforms

Island, but more land has been sold than houses put up, and efforts to get the poorer classes into the country have been largely defeated by the speculative price of suburban land and the demand for cheap labor in the city. The City and Suburban Homes Company (*q. v.*), and other similar companies have erected a few successful model tenements, settlements (*q. v.*) in New York have multiplied (there are now 44), charity organization societies have been wisely managed and their work vigorously extended, but the overcrowding (*q. v.*) grows, and its results are not adequately met. Agitation against the tenement evil resulted in a much improved tenement-house law in 1901, which a tenement-house commission is somewhat vigorously enforcing, but the problem is so large as to make progress slow. (See TENEMENTS.) Considerable has been done, however, in the way of tearing down the worst slums and opening playgrounds and recreation centers for the children. (See SLUMS.) Free lectures for adults, started by Dr. Henry M. Leipziger, have had a marvelous extension. People's concerts, etc., are frequently given to crowded audiences, notably at Cooper Union, and in the summer city bands play nightly in different parks, recreation parks, etc.

The transportation problem of New York is one of the most difficult. The opening of the Subway has proved a success, and yet increased services do not keep pace with the growth of population; four bridges and four tunnels are in course of building over or under the East and North rivers, and the electrification of railroads is in process; yet the demand for improved transit is unceasing, and overcrowding a crying evil. The Rapid Transit Commission, first organized in 1875, claims to have done its best tho much criticized by radicals as playing into the hands of the corporations (see NEW YORK CITY MONOPOLIES), its answer being that rapid transit must be had at the first possible moment, that the city, with its political corruption and its limitations as to the borrowing limit, cannot develop the needed systems, and that capitalists will not incur the enormous initial expenses involved, except for franchises of considerable length and possibilities of large returns. Meanwhile the consolidation of the great public utility corporations has gone on apace till the city finds itself largely in their power. (See NEW YORK CITY MONOPOLIES.)

The present charter of New York City was reported by a Charter Revision Commission in 1901, and in the main adopted, tho frequently amended

since on minor points and in some important respects.

Under this charter power is largely lodged in a board of estimate and apportionment, composed of 8 persons with 16 votes—the mayor (the chairman, with 3 votes), the controller (3 votes), the president of the board of aldermen and the borough presidents of Manhattan and Brooklyn (each with 2 votes), and of the Bronx, Queens, and Richmond (each 1 vote). The mayor is the

Government executive head of the city, and his signature is necessary to bills immediately affecting this city voted by the State Legislature, tho the bill can be passed over him, by a mere majority vote. The Board of Estimate and Apportionment is the money-voting power of the city. The borough presidents act to a certain extent as the mayors of their boroughs with large powers as to streets, improvements, etc. The controller has management of the city finances subject to the State Legislature and the Board of Estimate and Apportionment. The board of 73 aldermen has very limited powers, but grants small licenses, and under certain conditions can give a franchise for twenty-five years, as can also the Board of Estimate and Apportionment. The mayor, borough presidents, controller, and main officers are elected by popular vote for terms of four years, the aldermen for two years. The salaries of the mayor, controller, and corporation counsel are \$15,000; city chamberlain and Board of Water Supply (3 members), \$12,000 each; president of Department of Taxes and Assessments, \$8,000; borough presidents of Manhattan, Brooklyn, and the Bronx, and commissioners of bridges, charities, corrections, fire, health, police, street-cleaning, water-supply, gas, and electricity, and the tenement-house commissioner, \$7,500 each; city clerk, \$7,000; borough presidents of Queens and Richmond, president of the Board of Aldermen, \$5,000; aldermen, \$2,000; various deputies and assistants, from \$10,000 down. The main departments are finance, police, fire, health, law, education, taxes and assessments, parks, charities and corrections, docks and ferries. The main bureaus are licenses, buildings, highways, sewers, public buildings, franchises, statistics. Other important offices are those of the coroners, the commissioners of public works, of juries, licenses, and the commissioners of the sinking-fund, accounts, aqueduct, municipal civil service, and the board of assessors. The Rapid Transit Railroad Commission was replaced in 1907 by the Public Service Commission. The commissioners and heads of departments are mainly appointed by the mayor.

Among the important New York City reform societies are:

- The Citizens' Union, 252 Fourth Avenue.
- City Club, 51 West Forty-fourth Street.
- Bureau of Municipal Research, 32 East Twenty-third Street.
- National Civic Federation, 281 Fourth Avenue.
- Socialist Party, 239 East Eighty-fourth Street.
- Daily People (Socialist Labor), 28 City Hall Place.
- Defender (Prohibitionist), 404 West Twenty-third Street.
- Anti-Saloon League, 103 East 125th Street.
- American Federation of Labor, 25 Third Avenue.
- Central Federated Union, 184 Eldridge Street.
- University Settlement, 184 Eldridge Street.
- College Settlement (Women's), 95 Rivington Street.
- Charity Organization Society, 105 East Twenty-second Street.
- City and Suburban Homes Company, 281 Fourth Avenue.
- Consumers' League, 105 East Twenty-second Street.
- Rand School (Socialist), 112 East Nineteenth Street.
- American Institute of Social Service, 231 West Thirty-ninth Street.
- New York Federation of Churches, 119 East Nineteenth Street.
- Young Men's Christian Association, 215 West Twenty-third Street.
- Young Women's Christian Association, 7 East Fifteenth Street.
- Salvation Army, 112 West Fourteenth Street.
- Volunteers of America, 34 West Twenty-eighth Street.

NEW YORK CITY PUBLIC SERVICE MONOPOLIES: The following is a brief statement of the principle of these monopolies:

From an account of each it will be apparent that their record has been one of extortion. Their privileges were conceived in fraud and political corruption, and throughout their existence they have been a constant source of temptation to corrupt officials, have violated the law of the state, have made false reports to avoid the payment of just taxes, and have entered into a close

and friendly alliance with public officers whose duty required that they should protect the public from extortion.

THE GAS COMPANIES

Prior to 1880 competition existed among the gas companies of New York City. Since that time the companies have appreciated that monopoly was more profitable to their interests than competition. At present all the gas companies operating in the boroughs of Manhattan and the Bronx are controlled by or merged in the Consolidated Gas Company. The monopoly enjoyed by this company is absolute. Most of the very valuable franchises enjoyed by it have been obtained without any consideration being paid to the people. Notwithstanding the fact that their privileges were obtained free of charge, the rates exacted from the consumer by the gas companies have always been excessive and extortionate.

Down to 1885 the gas companies were furnishing gas to the consumer for \$2.50 and \$2.25 per thousand, altho the investigation of 1885 made it perfectly clear that at least one half of this price was clear profit to the company.

In 1885, the year of the investigation, the companies reduced the price to \$1.75, and in the following year it was reduced by act of the legislature to \$1.25. This price continued to prevail until 1897, when it was again reduced by law to \$1 per thousand. The alleged benefits which the people are supposed to have derived from this reduction have been almost wholly nominal, as poorer gas has been furnished under higher pressure with every nominal reduction in the rate.

It is perfectly evident from these nominal reductions that the price charged for gas bears no relation whatever to the cost of its production.

The report of the Thomas Committee in 1885 did good, however, because it supplied a great deal of information in reference to the dark and crooked ways of the companies. The companies appreciated fully the dangerous character of this report and copies of the report became very scarce. Professor Bemis says that, "according to the belief of many, the companies bought and burned all the copies on the market and hushed up the report most speedily." ("Municipal Gas," p. 70.)

The parent company of all the companies which are now merged in or controlled by the Consolidated Gas Company was the New York Gas Company, which was formed in 1823 with \$1,000,000 capital. The Board of Aldermen granted to this company a thirty-year exclusive franchise to lay pipes in the streets south of Grand Street. The franchise was given away, as the city received absolutely no compensation.

Various other companies were similarly formed from time to time, and also got franchises virtually for nothing.

In 1884 the Consolidated Gas Company was formed—a "holding company." It possest no public franchise, but held the stock of, and, therefore, controlled the following-named companies: New York, Manhattan, Mutual, Harlem, Metropolitan, Municipal, and Knickerbocker Gas-Light Companies. It was originally capitalized for \$39,078,000, of which \$35,430,060 was issued for acquisition of the properties and franchises of the constituent companies, subject to certain indebtedness. The Consolidated Gas Company did not include in its pool the Mutual or the Standard Gas

Companies. The Mutual agreed to enter the combination, but was prohibited by a provision of its charter which made its directors liable for a criminal offense if they voted for such combination. The Standard was also prohibited by its charter from consolidating. The Gas Trust represented by the Consolidated Company circumvented the law by buying the stock of these two companies and thus while avoiding responsibility for a criminal violation of the law accomplished its purpose and reaped the benefits that came from violating the law.

The capitalization of the Consolidated has since been raised to \$100,000,000, of which \$80,000,000 has been issued.

The New Amsterdam Gas Company was formed in 1898, a consolidation of other gas companies.

It is interesting to note that nearly all the shares of stock of the New Amsterdam Gas Company are owned by the Consolidated Gas Company. Thus the Consolidated owns 89,775 preferred shares out of a total of 90,000 preferred shares and 121,095 common shares out of a total of 121,650 common shares of the New Amsterdam Company.

It is exceedingly doubtful if any of the companies owned by the Consolidated possess any franchises at all at the present time. The status of the franchises under which the Consolidated is operating in Manhattan and the Bronx is well summed up in the following extract from the report of the Stevens Committee:

But it is doubtful whether the Consolidated Gas Company has any extensive rights in the city of New York. It appears that no franchise other than the franchise to be a corporation has been granted to the Consolidated Gas Company, and it would seem that several of the constituent companies have expired or will soon expire.

In the Borough of Brooklyn the Brooklyn Union Gas Company holds complete sway. Its monopoly is as complete within its territory as is that of the Consolidated within Manhattan. This company operates under franchises which it claims are practically perpetual. The report of the Stevens Committee, speaking of this company, says:

It is a serious question to what extent the Brooklyn Union Gas Company is lawfully exercising rights in the streets of the borough. It is evident that the matter should at an early date be made a matter of judicial inquiry upon proper action taken by the municipal authorities.

THE ELECTRIC COMPANIES

The Edison Electric Illuminating Company obtained the first electric-lighting franchise in 1881. It was authorized to lay wires, tubes, and conductors for supplying electricity in all the city streets. Under the terms of the franchise it was obligated to pay the city one cent per lineal foot of the streets occupied. The resolution granting the franchise was vetoed by Mayor Grace upon the ground that the compensation provided for was inadequate, but it was passed over the mayor's veto. (Myers's "History of Franchises," p. 184.)

Subsequent to this many new companies were formed and franchises were granted to them. These franchises were all acquired by the New York Gas and Electric Light, Heat, and Power Company.

In 1901 the New York Edison Company was formed. This company possesses no franchises,

but is merely a "holding company." It acquired all the rights and privileges of the old Edison Electric Illuminating Company, and the New York Gas and Electric Light, Heat, and Power Company. The New York Edison Company is to the electric-lighting industry what the Consolidated Gas Company is to the gas industry. The capital stock of the New York Edison Company is \$45,200,000, which is the aggregate amount of the capital stock of the two constituent companies. This sum represents gross overcapitalization. Bonds were issued by the company until its total outstanding obligations aggregated \$40,232,883.80. Witnesses on behalf of the company before the Stevens Committee endeavored to make it appear that the company owned valuable patents, trade prospects, and equities, but when these nebulous assets were analyzed it was found that a majority of its patents had expired and that all of these items did not exceed \$3,159,000. Notwithstanding the enormous and fraudulent overcapitalization of the company, its profits were so large that it paid \$2,000,000 interest on its inflated bonded debt and accumulated a surplus of \$8,000,000. No dividends were paid upon its stock, nearly all of which, it is interesting to note, is held by the Consolidated Gas Company.

The cost of electric current averages about 3.66 cents per kilowatt hour in Manhattan and the Bronx. Add to this all incidental expenses which the company incurs, whether necessary or unnecessary, including the payment of interest upon an inflated debt and dividends on "watered" capitalization, and the total cost would be 6.32 cents. The Edison Company has charged private consumers as high as 15 cents per kilowatt hour for electric current. It has charged, therefore, over 125 per cent more than the total cost, including all incidental expenses, fraudulent as well as honest.

For incandescent lamps furnished under a blanket contract, for which other large private consumers would have paid \$25,000, it appeared from the testimony of one of the officers of the company before the Stevens Committee that the city had been obliged to or rather did pay \$80,000. The proceeds of this "graft" yielded the Lighting Trust at the expense of the city \$55,000, for which the city got no value at all. It is strange that in view of examples such as these objection is made to public ownership on the ground that it would encourage corruption in our politics.

Brooklyn's electric-lighting monopoly is exercised in practically the same manner as that of the New York Edison Company. The Kings County Electric Light and Power Company owns the stock of the Edison Illuminating Company of Brooklyn, but the latter continues to be the operating company for its own plant and for the other plants which are controlled by the Kings County Electric Light and Power Company.

The sum charged by the Kings County Company for electric current was twenty cents per kilowatt hour. On Jan. 1, 1905, the rate was reduced to fifteen cents for the first two hours, ten cents for the third and fourth, and seven cents for the fifth and sixth, and so on. Current was furnished to special consumers as low as four cents per kilowatt hour.

THE STREET-RAILWAY MONOPOLY

The history of the street-railroad franchises in New York City is a record of fraud and municipal

corruption. Its record is too long and intricate to trace in this place.

The first grant of a franchise in the Borough of Manhattan was in 1832. Since that time the Board of Aldermen have bestowed the city's franchises with a lavish hand. The city's most valuable properties have literally been disposed of by wholesale. Most of the franchises were given away without any compensation being received by the city. Eighth, Sixth, Third, Second, and Ninth Avenues were rapidly acquired by the franchise grabbers. Several attempts to secure Broadway were made before Jake Sharp finally obtained the present franchise from the "Boodle Board of Aldermen" of 1884.

At present all the street-railroad franchises in Manhattan and the Bronx, whether in, over, or under the streets, are controlled by two companies. The street surface-railroad franchises are controlled by the New York City Railroad Company, and the elevated railroad and subway franchises are controlled by the Interborough Rapid-Transit Company. The Interborough Rapid-Transit Company was incorporated May 1, 1902. It was organized principally for the purpose of maintaining and operating the Rapid-Transit Railway under the Manhattan-Bronx franchise originally granted to John D. McDonald. This company also acquired the rights in the Brooklyn-Manhattan franchise. In Jan., 1903, the Manhattan Railway Company leased to this company all of its railroads and property for a period of 999 years from Nov. 1, 1875, the date of the organization of the Manhattan Railway Company. This company is capitalized for \$35,000,000. Of the total issue of stock, \$13,600,000 was used to acquire the \$6,000,000 stock and all interests of the Rapid-Transit Subway Company; \$9,000,000 was offered to stockholders of this last-named company at par and \$2,400,000 was sold to the public at 110. In June, 1904, the stock of the company was held by 415 stockholders. All of the stock was held under a voting trust for five years from May 12, 1902. Mr. August Belmont is president of the company.

In 1902 the Metropolitan Street-Railway Company leased to the Interurban Street-Railway Company its railroad and railroad routes, connections, rights, and privileges for a term of 999 years. In Feb., 1904, the Interurban Company changed its name to the New York City Railway Company. In Feb., 1902, the capital of the company was increased to \$20,000,000. The Metropolitan Securities Company was organized in 1902 as a security-holding company with a capital of \$30,000,000 for the purpose of providing for the present and future needs of the Metropolitan Street-Railway Company. Generally speaking, it may be said that the Metropolitan Securities Company owns the stock of the principal companies, which latter companies control and hold the bonds of smaller companies and lease to large rentals the franchises of various other companies.

Each company has watered its stock many times, and the organization of a Securities Company is a convenient method by which more water is pumped into them when they are re-issued as the stock of the new company. The one fact that is perfectly clear through all this complicated tangle is that all the dividends that are paid on all the stocks of the various companies, and all the interest that is paid on all the inflated "debts" of these companies, together

with all other charges, rentals, and expenses, come out of the people of the community.

The Rapid-Transit Act was passed in 1891. It was entitled "An act to provide for rapid-transit railways in cities of over 1,000,000 inhabitants." It provided for the continuance in office of William Steinway, John H. Starin, Samuel Spencer, John H. Inman, and Eugene L. Bushe, who had been appointed as commissioners under the Act of 1875.

The Manhattan-Bronx franchise was the first franchise granted by the Rapid-Transit Commission. The contract constitutes a printed volume of 180 pages, and was executed and delivered on Feb. 21, 1900. Under this contract the contractor agreed to construct and equip the Rapid-Transit Railroad upon the routes and general plans of the Commission, to put it in operation, and to maintain and operate it under a lease from the city for the term of fifty years. The city agreed to pay \$35,000,000 in case the whole of the road is constructed, and other specified sums in case it should determine to construct less than the whole. The city also agreed to give the contractor the right to construct and operate the railroad "free of all right, claim, or other interference, whether by injunction, suit for damages, or otherwise, on the part of any abutting owner or other person."

With reference to terminals, the contract provides that the city shall itself purchase the real estate for the terminals by condemnation or otherwise, and that the contractor is to construct them and receive the cost of such construction, with a profit of 10 per cent. The total amount to be paid by the city is stipulated shall not exceed the sum of \$1,750,000. This amount which the city pays is in addition to the \$35,000,000 paid for the cost of construction. The contract also provides that the city shall, if necessary, acquire lands for station and other purposes of the railroad in an amount not exceeding \$1,000,000, and that if the necessary real estate should cost more than that sum, such excess is to be borne by the contractor.

The city leases to the contractor the whole railroad for fifty years from the time of completion, and at the option of the contractor a new lease of the road is to be granted to him for a period of twenty-five years from the expiration of the lease provided for in the contract.

The contractor agrees to pay as rental a sum equal to the interest payable by the city upon the bonds issued by it to provide means for construction, and also 1 per cent upon the whole amount of such bonds, except that for the first five years the payment is not to be made unless the contractor's profits amount to 5 per cent a year.

The contractor under the contract, entitled to charge for a single fare not more than five cents during the life of the contract, and the franchise, rolling-stock, and equipment are exempt from taxation.

In 1894 the Rapid-Transit Act was amended so as to provide that the person, firm, or corporation operating the road should be exempt from taxation upon his or its "interest under said contract, and in all respects to the rolling-stock and other equipment of said road, but this exemption shall not extend to any real property which may be owned and employed by said person, firm, or corporation in connection with the construction and operation of the road."

This tax exemption was a very important amendment, as the original Act of 1891 provided that "every corporation organized under this act shall have its principal office and be taxed on its property in the city where its railway or railways are situated."

Under the contract the contractor is to furnish the equipment, but it is also provided that at the final termination of the lease the city is to buy of the contractor the equipment at a price to be fixed by agreement or by arbitration. This contract was awarded to John B. McDonald upon his offer to construct the road for \$35,000,000. McDonald also furnished a bond of \$1,000,000 for the faithful performance of the conditions of the contract. August Belmont & Co. organized the Rapid-Transit Subway Construction Company with a capital of \$6,000,000 to enter into a contract with McDonald to promote the construction of the road, to furnish the security given by him, and to finance his undertaking.

On their part, what do Mr. Belmont and his associates give in trade for this splendid possession? First, they pay the interest on the money which we supplied, about $3\frac{1}{2}$ per cent, and they pay 1 per cent sinking-fund—or much less than what they would have had to pay had they borrowed the money in the open market and undertaken the work as a private enterprise. That is all they pay—everything. The question of equipment may be disregarded, because the city must purchase the equipment at the end

of the contract term. As to the damage cases of adjacent property-owners, which most corporations have to pay—why, the city in its goodness also engages to satisfy all of them. The city will not get, all told, as much as if the property were subject to ordinary taxation and no other payment made whatever to the city.

In upholding the constitutionality of the Rapid-Transit Act, Judge Barrett reviewed some of the objections to the law in the following language (*Sun Publishing Ass'n vs. Mayor*, 8 App. Div., 230, 247): "The plaintiff's argument rests necessarily upon the theory that the board will not faithfully discharge its duties to the city, but will act entirely in the interests of the contractor—an inference which is purely gratuitous."

This decision was, of course, rendered before the McDonald-Belmont contract was made. What was at that time a "purely gratuitous" inference became afterward an actual fact. The board did act in the interests of the contractor rather than of the city. It did require the minimum compensation allowed by law. It did make the worst possible contract which by law it was authorized to make.

On Sept. 11, 1902, the board awarded the contract for the Brooklyn-Manhattan Railroad to the Rapid-Transit Subway Construction Company. All that can justly be said of this contract is that it is not in all respects as bad as was the Manhattan-Bronx contract. The enormous profit which the company will derive from this contract, providing, as it does, for exemption from taxation, is evident from the fact that the company consented to construct the road, the estimated cost of which would be almost \$9,000,000, for \$3,000,000.

Notwithstanding that the Brooklyn Rapid-Transit Company enjoys valuable franchises in hundreds of miles of the city's streets and has been accorded franchises which are practically perpetual, probably no corporation which has ever operated in the city of New York has shown a more consistent contempt for the public and a more complete disregard of their rights and convenience than has this company. Its cars are in bad repair and are permitted to remain in a dirty condition, while during the winter months little or no attempt is made to keep them adequately heated. The services accorded the public of the Borough of Brooklyn, that is at present absolutely dependent upon it, are simply atrocious. The treatment of its employees has always been bad, and, in common with the other railroad companies operating in the city, it has paid no attention whatever to the provisions of the labor law.

On Oct. 9, 1902, the Rapid-Transit Commission issued its certificate granting a franchise to the Pennsylvania, New York & Long Island Railroad Company, a franchise of which a committee of the Rapid-Transit Commission, consisting of A. E. Orr, Charles Stewart Smith, and Edward M. Grout, declare in their report: "Your committee has no hesitation in saying that its terms are, on the whole, *very greatly in the interest of the city of New York.*"

The committee in their report offer no excuse for accepting terms which secure to the city grossly inadequate compensation, altho the committee seem to offer their apology to the railroad company for having charged it the paltry and ridiculous sum of \$200 a year in return for the rights under the North and East rivers.

The New York and Jersey franchise was granted by the Rapid-Transit Commission July 10, 1902.

This valuable franchise is, by the terms of the grant, given in perpetuity upon absurdly inadequate compensation.

The only theory upon which it seems possible to understand the extraordinary policy pursued by the Rapid-Transit Commission in disposing of the franchise wealth of the city is that the commission is under the impression that any corporation which consents to accept and operate a public franchise confers a benefit upon the public.

The Hudson and Manhattan franchise was granted by the Board of Rapid-Transit Railroad Commissioners on Nov. 24, 1903.

The franchise is granted in perpetuity upon grossly inadequate compensation. For the right to enter the city the company is to pay \$100 per annum for twenty-five years. For rights under dock property the company is to pay at fifty cents per foot per annum for ten years and \$1 per annum for the next fifteen years. For street or vault rights in Cortlandt, Dey, and Fulton streets, contiguous to terminal stations, the company is to pay at the rate of forty cents per square foot per annum for ten years and eighty cents per square foot per annum for the next fifteen years.

For tunnel rights under the streets the company is to pay \$9,000 per annum for ten years and \$15,000 per annum for the next fifteen years.

The total estimated sum per annum which the city would receive is, for the first ten years, \$13,040.80; for the next fifteen years, \$22,993.60.

The Belmont monopoly, by the grace of the Rapid-Transit Commission, is grasping New York City in its toils, and unless the people take decisive action at once, the city will be completely at its mercy. Mr. Ray Stannard Baker's summary contains a warning against, as well as a description of, the growing Belmont power:

"The people do not realize what this Belmont monopoly has already come to be. It is not only the greatest combination of street-car interests New York ever had but it promises to be the most piratical. The aim of Belmont, and the European Rothschilds behind him, is complete monopoly. Already he controls the subway and all the elevated railroads in Manhattan, he owns the surface-car lines in Long Island City, and he has just acquired the old perpetual franchise of the Steinway Tunnel Company, which enables him to build another tunnel to Brooklyn, and he is on the way to obtain other important rights. Through his associates, also, he is interested in the new Hudson River Tunnel, which recently obtained a franchise up Sixth Avenue, thereby giving him a grasp of the passenger traffic of Jersey City. And now he is trying to get hold of the financially dishonest Metropolitan Railway Company, which controls the surface lines of Manhattan. When he gets that he can rest with smiling content, having captured the city."

That Mr. Belmont is well satisfied with the existing situation we know, for he has told us. He has even gone so far as to congratulate the public upon the contract which it made with him for the building and operation of the subway and to warn us of the dangers of municipal ownership.

Listen to what Mr. Belmont says:

At a time when there are so many ill-digested and ill-considered plans under discussion, having for their object not only municipal ownership but municipal operation of transportation lines, the city of New York has reached the true

solution of this problem—that municipal participation is justified to the extent of furnishing credit for the construction of such a work, but should stop short of the operation of the property when constructed. To private interests should be committed the risks and the burden as well as the profit of constructing, equipping, and operating the road, the latter not being within the governmental functions or other legitimate province of a municipality.

NEW ZEALAND: New Zealand, from the standpoint of social reform, is one of the most interesting and, in very many respects, the most advanced country in the world.

I. Statistics

The colony of New Zealand consists of three main islands, with several groups of smaller islands lying at some distance from the principal group. It has an area of 104,751 sq. m., about one fourth larger than Great Britain. Population, 1906 (including 47,845 Maoris), 888,758, or 7.4 to the square mile; 471,008 were males. There were 2,570 Chinese. The birth-rate fell from 37.32 in 1882 to 25.12 in 1899, since when it has risen to 27.22 in 1905. The marriage rate has steadily risen from 5.94 per 1,000 of population in 1898 to 8.28 in 1905. Illegitimate births increased from 3.70 in every 100 born in 1893 to 4.55 in 1903. Divorces increased from 25 in 1893 to 103 in 1901 and 91 in 1902. The death-rate is lower than in any country of which we have statistics; it was only 9.27 in 1905. In 1906 the chief cities, Wellington (the capital) had a population of 58,503 (with suburbs, 63,807); Auckland, 37,736 (with suburbs, 82,101); Christ Church, 49,928 (with suburbs, 67,878). Education is free and compulsory, and mainly in the hands of the State. The number unable to sign their marriage certificates was 205 in 1881, 117 in 1891, and 68 in 1903. There were in 1905 1,606 public primary schools with 137,623 pupils and 295 private schools with 16,378 pupils. The regularity of attendance is high, being some 85 per cent of the average roll number. The school age is from five to fifteen.

A great advance was made during 1902 in respect to manual and technical education. The total number of recognized classes, which at the end of 1901 was 425, increased to 980 at the close of 1902.

There were in 1905 27 endowed or incorporated secondary schools, with 4,060 pupils. There were also 3 schools of mines, 4 normal schools, 5 schools of art, and 11 industrial schools, all more or less aided by the government. The New Zealand University is a degree giving body with several affiliated colleges giving advanced education. There were in 1903 364 public libraries subsidized by the State.

Crime is on the decrease (see CRIME, page 240). Drunkenness, however, seems increasing, the mainly among persons who have come to the colony from abroad. At the census of 1901, out of the total population of New Zealand over fifteen years of age, 51.85 per cent were found to have been born here; while the proportion of the convictions for drunkenness of New Zealand-born Europeans to the total convictions was in the year 1900 about 17 per cent only. Of those in jail only 28 per cent were New Zealand born.

In 1904 there were 1,180 various relief institutions. There are 19 benevolent asylums for the indigent, with 1,167 inmates. The needy are aided by relief boards. There are 4 orphan asylums, but the boarding-out system is largely adopted for needy children. In 1903 there were 2,174 inmates of various asylums. It is educational rather than charitable. Under the First Offenders' Probation Act, such offenders are placed under probation officers.

There is a school for deaf-mutes and one for the blind. The main occupation is agriculture. In 1901 there were employed in agriculture 89,222; in manufactures, 60,819; in commerce, 33,394; in the professions, 23,509; in mining output, 17,816; in fisheries and forestry, 3,667; in domestic occupations, 34,394.

Two thirds of the country is suitable for agriculture and grazing, the 20,000,000 acres are still under forest. In 1906 there were reported 37,767,460 acres in 69,942 holdings; of these 19,787 had 1 to 20 acres; 17,745, 20 to 50; 7,562, 50 to 100; 9,950, 100 to 200; 20,405 had 200 to 1,000; 811 had 1,000 to 50,000; 90 had 50,000 and over.

(For the land system, see below.) In 1901, of those engaged in agriculture, 28,337 were farmers, 12,908 family or relative assistants, 19,749 farm-laborers, 3,220 run-holders, and 7,668 station hands. The principal crops wheat, oats, and barley. The natural mineral resources of New Zealand are great, and have exercised in the past an important influence on the development and progress of the colony, particularly as to gold. In the earliest years the gold was obtained from alluvial diggings, but at the present time the greatest quantity is taken from gold-bearing quartz, which is distributed widely through the colony, and thus there is a prospect of more permanency than alluvial diggings could give.

Up to 1906 the value of the gold produced was nearly

£70,000,000; in 1905 it was £2,093,936. The same year silver was produced to the value of £1,179,744; coal, £838,531. Manufactures in 1900 had a capital estimated at £7,959,000 with a product (1900) of £17,141,149. Commerce is on the increase. The main exports are wool, frozen meat, gold, butter and cheese, sheepskins and pelts, tallow, gum, grain; the chief imports, clothing, steel goods, and machinery. In 1905 the exports were: to the United Kingdom, £7,705,384; to the Australian states, £1,815,717; to the United States, £1,438,501. Exports from the United Kingdom, £12,087,118; Australian states, £3,294,271; U. S., £716,301. The registered vessels of the colony (foreign and coast) were, in 1905, 338 sailing vessels, of 41,576 tons, and 271 steamers, of 76,543 tons.

In no country in the world are general conditions so favorable to all. Wages are high, while other features (see below) make labor secure and

The estimates of the wealth of New Zealand, from the *Official Year Book of 1904*, are as follows:

ESTIMATED PRIVATE WEALTH

| YEAR | Amount | Average per head |
|-----------|--------------|------------------|
| 1893..... | £156,058,273 | £232 |
| 1900..... | 228,236,158 | 296 |
| 1901..... | 229,587,916 | 291 |
| 1902..... | 240,054,835 | 297 |
| 1903..... | 256,402,400 | 308 |

The above table seems a sufficient answer to those who have questioned the advantage to New Zealand of her progressive policy.

In 1901 the unimproved value of the land was estimated at £75,832,465 and of improvements at £46,392,564, a total of £122,225,029; in 1905 the corresponding figures were £122,937,126 and £74,747,349, a total of £197,684,475.

II. Government and Constitution

The government consists of a governor appointed by the crown (Lord Plunket), a ministry, and two houses of Parliament (a Legislative Council and House of Representatives). The High Commissioner in London is the Hon. W. P. Reeves (*q. v.*). The Council has thirty-five members, nominated by the governor; the House, eighty members, elected triennially by adult suffrage, and includes four Maoris.

The qualifications for electors are residence in the colony for a year, and in the electoral district for three months. Women have the suffrage, but the proportion of women enrolling shows some signs of falling off and in general woman's suffrage in New Zealand has shown no remarkable results either favorable or unfavorable. There is little or no tendency to elect women to offices. Members of the Lower House receive £300 and of the Upper House £200 a year. For local government the country is divided into 91 counties and 103 boroughs, the counties being further divided into town districts and road districts.

The Ministry, consisting of eight, is the responsible governing body, and since 1890 has

been in the hands of the Liberals with a large policy of public works and governmental activities. This has meant large government expenditures, and considerable increase of debt, but in reality only an apparent increase, since the expenditures in almost all cases have been on activities sufficiently remunerative to bring in revenue enough to pay off the interest on the debt they have created and supply a sinking-fund to gradually pay off the debt. The few exceptions have been for expenditures so plainly for the benefit of the colony as to call out little general censure. The average debt per head of population in 1896 was 60*l.* 20*s.* 6*d.* and in 1906, 67*l.* 0*s.* 11*d.* The average taxation per head in 1901 was 3*l.* 19*s.* 6*d.*, and in 1906, 4*l.* 7*s.* 7*d.*

The chief sources of revenue (1906) were: Customs, £2,697,411; railways, £2,338,418; post and telegraph, £1,201,263; land tax, £383,756; income tax, £261,816; total (with other sources), £7,828,570. The chief expenditures were: Public debt charges, £2,187,437; railways, £1,594,954; education, £714,071; post and telegraph, £577,115; constabulary and defense, £291,808; total (with other items), £7,122,340.

Nearly all public works are now in the hands of the government. In the early days these simply kept pace with the spread of settlement, but by 1870, however, the progress of the country seemed to demand inauguration of the "Public Works and Immigration Policy," which provided for carrying out works in advance of settlement. Railways, roads, and water-races were constructed, and immigration conducted on a large scale. Hence largely the increased debt.

Government activities now include operation of all public utilities, government banking, postal savings-banks, nationalization of much of the land, government loans to home-builders, State operation of coal-mines, State trusteeship and management of estates, State title guaranty, progressive taxation of land values

State Activities

and exemption of improvements, State purchase of patents, village and farm settlements for the poor, direct employment on public works, mandatory arbitration of labor disputes.

Government railways (1906) included 2,520 miles (a private line has 89 miles). The surplus of returns above expenditures (see above) was £743,464. The total expenditure on government lines to March 31, 1901, has been £24,092,085. The freight carried was 4,241,422 tons, and the passengers numbered 8,826,382. (See RAILWAYS, section New Zealand.) The telegraph system, wholly in the hands of the government, had (1906) 8,355 miles of line. The net surplus of receipts above expenditures for the post and telegraph was £106,152. The telephone is similarly in the hands of the government, and quite remunerative, being very generally used and the rates low.

There are five banks of issue doing business, the Bank of New Zealand being the government bank. In 1894 the government voted £2,000,000 to save it, and now virtually runs it, several of its directors being appointed by the governor. The government postal savings-banks also do a large business. Practically all the money-order post-offices are savings-bank offices, and give the people far more banking facilities per head than in England or the U. S. They are largely used because perfectly safe. No postal bank has ever closed its doors or experienced a run on its funds. The deposits are invested in public works and im-

provements. The government also makes favorable loans to farmers. Life-insurance is also largely in the hands of the government, as shown by the following table of New Zealand insurance for 1902:

| NAME OF OFFICE | Number of years of business in the colony | New Zealand Business only | |
|--|---|---|--|
| | | Number of existing policies at end of year 1902 | Gross amount insured by policies at end of year 1902 |
| Australian Mutual Provident Society..... | 41 | 29,544 | £8,015,240 |
| Nine other societies..... | | 26,958 | 6,785,985 |
| Life-Insurance Department of the New Zealand Government..... | 33 | 42,406 | 9,896,572 |
| Total, Dec., 1902..... | | 99,908 | £24,697,797 |

In the year 1903 was passed an act "to establish a State Fire-Insurance Office and to make other provisions for the insurance and protection of insurable property in New Zealand against loss or damage by fire."

Besides this, in 1899, the government Commissioner of Life-Insurance was given power to insure persons against accident, and specially employers against liability for accident to any person employed, besides generally doing the business of an insurer against accident.

In 1903 the receipts of this department were £24,449, and expenses £19,690, of which £13,230 were paid in claims.

The government conducts a Public Trust Office which (1904) managed 836 wills and trusts (including sinking-funds accounts), 1,062 intestate estates, 854 lunatic estates, 119 native reserves, 333 West Coast Settlement Reserves, 266 unclaimed lands; total, 3,475.

In 1903 the State commenced operation of some State coal-mines, producing some 3,500 tons per week.

The famous land system of New Zealand rests mainly on the Land Act of 1892. The general policy consists (1) of breaking up land monopoly by progressive taxation of the larger

Land System holdings; (2) of conserving the remaining public lands for genuine settlers; (3) of limiting the areas of holdings and the right of transfer; (4) of buying up and dividing large estates; (5) of establishing long leases, with periodic revaluations, instead of freehold purchase, as the tenure for land; (6) of preference of the landless in sales, and of aiding, by State loans, etc., the unemployed and the artisan class to get on the soil. Carrying out this policy, land under the Act of 1892 can be had: (1) as freehold, but subject to improvement within seven years to the amount of £1 per acre for first-class land, and half that for second-class, title not being given till the expiration of the seven years; (2) for occupation with right of purchase—a twenty-six-year lease for 5 per cent annually on the cost price of the land, with the right of purchase at the end of ten years, and the fulfilment of exacting conditions as to residents and improvements; (3) for lease in perpetuity (999 years) at a rental of 4 per cent on the cash price, subject to conditions of improvement and residence, without revaluation

and without right of purchase. No lease can be assigned in law or equity, or taken in execution, or charged in any way for twelve months. Transfer of leases cannot be made without the consent of the Land Board of the district, and mineral lands, resumed lands, special settlements, and improved farms can only be obtained on lease in perpetuity. Purchase in this form is favored in other ways so that as a matter of fact a very large proportion of holdings are now given under this tenure. In 1896 the sale of large estates to the government was made compulsory, on favorable terms to the owner, but the possibility of this together with the pressure of graded taxation has made it seldom necessary to use compulsion, while large areas have come into government ownership and the profit to the government has been large.

Crown lands are divided into three classes: (1) Town and village land, the upset prices of which are respectively not less than £20 and £3 per acre; such lands are sold by auction. (2) Suburban lands, the upset price of which may not be less than £2 per acre; these lands are also sold by auction. (3) Rural lands, being lands not reserved for towns and villages, classified into first- and second-class lands, which may be disposed of at not less than £1 per acre for first-class and 5s. an acre for second-class lands; such lands may be either sold by auction after survey, if of special value, as those covered with valuable timber, etc., or be declared open for application. Pastoral lands are included within the term "rural lands," and are disposed of by lease. Besides these general forms of tenure special enactments have been made to aid the landless and working classes to get land.

(1) Under the Small Farms Association system any group of persons numbering not less than twelve may apply for a block of land of not less than 1,000 acres nor more than 11,000 acres; but there must be a member for every 200 acres in the block, and no one may hold more than 320 acres, except of swamp lands. The price of lands within a special settlement cannot be less than 10s. an acre. The rental may not be less than 4 per cent on the capital value of the land; the tenure is lease in perpetuity. Residence, occupation, and improvements are generally the same as required under ordinary tenure.

(2) Land may be had under the Improved Farm Settlements Act on application to the commissioner, preference being given to married men. The area of the farms may vary from 10 to 200 acres, according to locality, and no settler can select more than one farm. The land is leased for 999 years at a rental of 4 per cent on the unimproved capital value, to which is added the amount advanced by government for clearing, grassing, etc. Residence for the first ten years is compulsory, and the improvements to be effected are similar to those on leases in perpetuity.

Village settlements are disposed of under regulations made from time to time by the governor, but the main features are as follows: Such settlements may be divided into—(1) Village allotments not exceeding 1 acre each, which are disposed of either at auction or upon application as already described, with option of tenure, the cash price being not less than £3 per allotment; and (2) homestead allotments not exceeding 100 acres each, which are leased in perpetuity at a 4-per-cent rental on a capital value of not less than 10s. per acre. Where a village-settlement selector has taken up less than the maximum area prescribed, he may obtain an additional area in certain cases without competition, on the same tenure and terms as the original holding. Residence, improvements, and applications are the same as already described. The leases are exempt from liability to be seized or sold for debt or bankruptcy. The governor is empowered in certain cases to advance small sums for the purpose of enabling selectors to profitably occupy their allotments.

Under these different forms large areas have been taken up, especially under the Small Farms Association system.

Special efforts have been made to get the unemployed out of the cities on to the land. Land

within any borough of 15,000 or more inhabitants or within fifteen miles of it can be taken by compulsory process for working men's homes. A man may take a lot not exceeding five acres, and government advances of up to £50 will be made him for fencing, planting, and building. The unemployed are also helped to secure work on public works, while considerable areas of forest-clad lands have been set aside and small contracts given for clearing, burning, and sowing these with grass. As the result of all this, holdings of over one acre have increased from 46,676 in 1895 to 69,942 in 1906; an increase of about 50 per cent in eleven years.

A vital portion of the government's policy is its system of taxation.

In 1891 a land and income assessment act was passed repealing the property tax formerly existing, and providing for an ordinary land tax on the actual value of land, exemptions or deductions being granted on account of improvements. The rate for 1905-6 was 1d. in the pound, yielding a revenue of about £281,000. In addition to the ordinary land tax there is a graduated tax on land, rising from one sixteenth of a penny in the pound on values from £5,000 to £7,000, up to 3d. in the pound on values of £210,000 and upward. This graduated tax yields in round numbers £105,000 per annum. The income tax-rate is 6d. in the pound on the first taxable £1,000 (i. e., after deducting the £300 exemption), and 1s. in the pound on taxable incomes over £1,000. The indirect taxation is by way of customs duty and excise duty on beer made in the colony.

The avowed object of this taxation is to break up monopoly and free the small producer. Mortgages are deducted from the land, but the lender

is taxed three farthings in the pound.

Taxation The old, infirm, widows, and orphans with small incomes may also be exempted. Absentee owners of large

estates have their taxes increased 20 per cent. The working of the law is such that out of 18,000 people having incomes below the level of the income tax or graded land tax, who were taxed under the old property over £10,000, under this system are released from direct taxation. Yet the large estates pay so much more that the total receipts from taxes have been increased. There is also a progressive inheritance tax rising from no tax on the first £100 to 7 per cent on estates of £1,000; £4,000 and estates above £4,000, 10 per cent. Strangers in blood excepting adopted children pay 3 per cent more. Local authorities are also allowed, on the vote of a certain proportion of their cities, to convert their property taxes into a land value tax, of equal amount, and improvements being exempt as in the national taxation. This embraces, as far as it goes, the single-tax principle, but how far New Zealand is from adopting the single-tax is seen in the extent to which other things than land are taxed, and the small extent to which the land values are taxed. It simply embodies one feature of the single tax in a generally socialistic system. (See INCOME TAX; INHERITANCE TAX; SINGLE TAX.)

Another well-known portion of the government's policy is its industrial legislation on compulsory arbitration, and toward labor. As to compulsory arbitration, for other details, see p. 61.

The essence of it is that either side may demand arbitration, and that the decision has the binding force of a judicial decision. It has

Labor Legislation

made of New Zealand "the land without strikes," and has been copied in Australia and elsewhere. Factory legislation generally in New Zealand, beginning as early as 1873, to-day is in advance of that of any other country. Except in a few specified instances, no man can be employed in a factory over 48 hours a week, nor over 8½ in one day, nor more than 5 hours continuously; females and boys under 16 can only be employed 45 hours a week, and not more than 4½ hours continuously, or 8½ in one day. Children under 14 may not be employed in factories. Factories are carefully inspected, and good ventilation and hygiene strictly enforced. Any room where two or more persons are employed is a factory. To prevent sweating, records must be kept of all work done outside of factories, with the names and addresses of the workers, all subject to government scrutiny, and all articles so made must be so labeled.

A shop act of 1905 limits the employment of females and boys under 18 in shops to 52 hours per week, and 9½ hours in one day. This practically compels stores to close at supper-time; weekly half-holidays are required; offices, with a few specified exceptions, must close at 5 P.M. on ordinary days, and 1 P.M. Saturdays. The Saturday half-holiday is universal. Seats must be provided for girls in stores.

One important part of the government's labor program is the carrying on of public works by co-operative labor, instead of by contracts. Under this system, begun in 1891, four or more workers may unite in a cooperative group, elect a foreman, and take a contract for a given piece of work, each man in the group having an equal interest, the government buying the materials and supervising the work. The railways and public works of New Zealand since 1891 have frequently been built in this way, the result being better work, lower cost, and better men. The average number employed on public works in 1904 was 3,798. The government is also urging and teaching cooperation in agriculture, and does commission work for the farmers. In every way the government has sought to aid labor. The government has a Labor Department and its head is a member of the cabinet. It collects statistics, but its first duty is to find work for the unemployed. The chief agents in this work are the factory inspectors and secondly the police. The police all over the island are on the lookout for opportunities for employment to be reported to the labor bureaus. The main effort is to get the men out of the cities into the country. To this end the government gives men looking for work free passes on the State railways, they undertaking to refund the price from their future wages, or it to be deducted from their wages, if they get employment on public works. (See above.) From June, 1891, to March, 1904, the Labor Department found work for 35,257 men, with 74,007 persons dependent on them. There is also a State farm at Levin of 800 acres of heavy forest and scrub, managed by the Labor Department, where the unemployed can be given temporary work and families given temporary shelter. Its improvement has met the cost of the work, tho the majority sent there are elderly men unused to such work and who have to be taught.

The Unemployed

The Old-Age Pension Law is also well-known, passed in 1898 (amended 1905). Every person, not an alien, Asiatic, criminal, or drunkard, is en-

titled to a pension of £20 a year after the age of sixty-five. No one whose property amounts to £260, or who has a yearly income of £60, can receive a pension, and in the case of those who have less, deductions are made proportionate to their property and income. The total number of pensions in force on March 31, 1906, was 12,583, representing a yearly payment of £513,018, the average pension being about £24 18s.

All this government activity rests on a democratic basis. All property qualifications for the suffrage were done away with in 1896. Representatives are nominated by petitions in writing signed by two or more voters of the district and transmitted, with the candidate's assent and a deposit of £10, to the returning officer, who immediately publishes the name of the candidate.

Electoral System

When the election comes, each voter is given a ballot which is simply a list of the candidates in alphabetical order, with no party name, symbol, or description of any kind. There is no party machine nor boss. A referendum system has also been adopted. At every triennial election there is a referendum as to the liquor traffic, there being full local option. The voters of each district are asked to vote for the continuance, the reduction, or the prohibition of licenses. The result is a growth of the prohibition vote and the extension of prohibition territory.

Municipal manhood suffrage was not adopted till 1898. Municipal ownership is consequently not so developed as national public ownership, tho all the cities own and operate their own street-cars, gas-works, water-works, and electric plants. Rates are much lower than in the U. S. A penny is the average street-car fare within city limits. To some extent, however, as in Australia, the State operates local services.

The police is wholly in the hands of the State and numbers 656. There is a militia liable for service of 140,000 (permanent, 262) and a volunteer force (1905) of 18,545. The colony has some torpedo boats but no navy.

III. Social Reform

The story of social reform in New Zealand is the evolution of the government activities described above. The following brief outline of its development is abridged from Professor Parsons's "The Story of New Zealand":

Discovered by Tasman (1642); visited by Captain Cook (1769); the first British resident arriving in 1833; the first body of the New Zealand Company's immigrants arrived and New Zealand was annexed to the British Empire as a part of New South Wales in 1840, and made an independent colony in 1841. The real founder of the colony was Gibbon Wakefield (q. v.), who directed the New Zealand Company, and whose aim was scientific colonization. Its first great governor was George Grey (q. v.), who arrived as governor in 1845. In 1850 the interests of the company were surrendered to the imperial government and the present constitution adopted 1862. Gold was discovered in 1861. Real executive power passed to the ministry in 1868. The chief questions in the early years were as to the natives and the colony *vs.* the local provinces. One of the early policies was cheap or free land, with the use of the Torrens transfer system. This developed very large holdings. (Necessities of development, however, called out State activ-

ities and able leaders. The first railway was opened 1863; postal savings-banks were established 1865; government life-insurance, 1869; Public Trust Office, 1872. This public works policy was largely due to Sir Julius Vogel, treasurer in the ministry of William Fox. In 1875 Sir George Grey commenced a strong campaign for liberal and democratic principles, and influenced the whole colony and all Australasia. He sat in New Zealand's Parliament continuously from 1879 till his death in 1890. His Land Tax Act (the first land value act) was carried in 1878. The perpetual lease system, the first proposed by Liberals, was enacted by a Conservative ministry (Whitaker's) in 1882. The Village Settlements system, the first efforts for the unemployed, and other land features were mainly due to John Ballance, Minister of Land, and occasioned by the bad years of 1885 and 1886.

The year 1890, however, saw a political revolution. The years from 1885-90 had been years of depression. During that period 20,000 left New Zealand. The unemployed were numerous. Yet millions of acres lay idle in the hands of monopolists. Meanwhile the seeds of liberal and radical thought, sown by Vogel, Grey, and Ballance, with the beginnings of land-value taxation, had found ready soil. Henry George lectured through Australasia early in 1900, and tho no Australasian commonwealth adopted his ideas, they set men thinking.

The defeat, too, in 1890, of the great shipping strikes in Australia and New Zealand (see AUSTRALIA) drove the trade-unionists to the ballot. In New Zealand, however, they did not form a new Labor Party as they did in Australia, but joined with the small farmers in supporting the Liberal Party, led by John Ballance, who as Land Commissioner had shown himself a radical friend of the people. There is no Labor Party distinctively in New Zealand, tho five or six Labor men have been elected to Parliament since 1890. These and other causes led to the political overturn of 1890. The campaign turned on land and labor and taxation. The larger estates were held responsible for the depression. The result was that Ballance became Premier with a Liberal Labor House. The council was against the ministry, but Mr. Ballance demanded that the governor appoint twelve new councilors to enable the ministry to carry out its pledges. The governor objected, but consented to refer to the English colonial office. This supported the ministry as constitutionally in power and the councilors were appointed. The Liberal Labor legislation then began. The first work was the taxation of the land monopolists (see above), the ministry declaring its purpose to be to check monopoly, aid the poor, and equalize wealth. The Hon. John McKenzie was made Land Minister and the land reforms were carried out. In 1893 the women were enfranchised. In 1894 the Bank of New Zealand was practically nationalized (see above). John Ballance died in 1893, and then Richard J. Seddon was made Premier, and enthusiastically carried on the Liberal Labor program. In 1891 the Hon. W. P. Reeves, Ballance's Minister of Justice and Education, was made Labor Minister, at the head of the new Labor Department, and much of the advanced labor legislation of New Zealand, especially the great Arbitration Act and the aiding of the unemployed, is due to him, altho since 1896 Mr. Reeves has been Agent-General for New Zealand in London. In 1898 the old-age pensions were established; in 1901

universal penny postage and the State coal-mines act was passed. Mr. Seddon died in 1906. The elections of 1902 and 1905, however, guarantee a continuance of the Liberal Labor policy, in 1905 (December) the opposition securing less than 20 seats in a House of 80. In Sept., 1906, the New Zealand Government introduced a new land bill of a drastic nature, "especially the clauses compelling all owners to sell within ten years excess of land held beyond £50,000 unimproved value, and the provisions preventing present owners of 1,000 acres of first-class land, or 5,000 acres of second-class land, from adding to their estates either by freeholds or leaseholds. Under these clauses future sales or leases of first- and second-class land would have to be in 1,000-acre and 5,000-acre lots or less respectively."

Labor, however, wants more.

The New Zealand Trades Council's Conference in 1906 passed a resolution in favor of the following six items of policy: (a) Nationalization of land and of mineral wealth. (b) Nationalization of marine, coastal, and intercolonial services. (c) Government State clothing and boot factories, flour- and woolen-mills, bakeries, ironworks, and ship-building yards. (d) Nationalization of kauri gum industry. (e) Rating on unimproved values. (f) Stoppage of sale of crown lands and revaluation of crown lands held on lease.

The *Daily Mail Year Book* for 1907 prints the following extract from a private letter from Mr. Tregear:

Here, in New Zealand, we keep pegging away, sapping little by little the foundations of one monstrous privilege after another. We got arbitration upon its sturdy legs, and I know you have followed its career with interested eyes. Now we have again a crusade against the landlords in cities and suburbs, because every advantage in wages, etc., gained for the workers by arbitration is being exploited and neutralized by robber rents. We are taking voluntarily, by sale, or compulsorily, lands near towns for workmen's homes, to enable the holder to erect homes, etc., thereon, secured, of course, on the land and improvements themselves. The result is, no country is prospering in the world at the present time like New Zealand. Let no man think, however, that our prosperity leaves us without evils to combat. We have barely touched the fringe of the soiled economic garment. So long as the wage system endures, so long as capital holds the land, machinery, and other means of production, so long is the bulk of our population only a collection of well-fed, well-clothed slaves.

Cogan (annuals); *The Story of New Zealand*, Frank Parsons, 1904; *State Experiments in Australia and New Zealand*, William P. Reeves, 1902; *Newest England and A Country Without Strikes*, Henry D. Lloyd, 1900; *Our Foes at Home*, Hugh H. Lusk, 1897; *Labor Conditions in New Zealand*, V. S. Clark in *Bulletin* 49 of U. S. Bureau of Labor, Nov., 1903.

NICHOLLS, GEORGE: Member, British Parliament, of the Labor Party for Northants, N.; born 1864 at Whittlesea; became a farm hand at the age of eight, a navvy in 1883, and went back to Whittlesea to take up work in the gravel pits. He was a lay pastor of the Congregational Church at Chatteris from 1894-1902. Elected to Parliament by the Labor vote in 1906. Address: Chesterton, Staffordshire, England.

NIUWENHUIS, FERDINAND DOMELA: A Dutch Socialist; born at Amsterdam, 1846, and educated for the ministry at Luther College; clergyman in Harlingen, 1870; Beveruyk, 1871, and in 1875 at The Hague. Here he became a celebrated preacher; but in 1879 left the Church, feeling that it was on the side of the rich against the poor. Henceforth he devoted himself to the Socialist propaganda, being for long the head and front of the movement in Holland. In 1879

he founded the *Recht voor Allen*, the main Dutch Socialist weekly. From 1888-91 he was a member of Parliament, a position he cared very little for at the last, believing that the government was so completely in the hands of the capitalists that for Socialists to attempt to work through it was worse than useless. The feeling grew upon him till he utterly opposed the participation of Socialists in politics, and was therefore opposed by the majority of the Dutch Socialists, who often called him an anarchist, tho his ability and radical utterances made him popular among the masses. He was sent, however, to Socialist international congresses at Paris and Zurich (1893), where he entered into heated controversies with Liebknecht and others. He found himself in a dwindling minority till his influence largely passed away. He has published numerous books and pamphlets in Dutch or German, among which are "My Farewell to the Church," "The Labor Day," "Capital and Labor," "The Book of the Kings," "The Life of Jesus," "The Bible," "Essays on the French Revolution," "The Future Social Democracy," etc.

NØRREGÅRD, JENS: Norwegian educator; director of the Testruje Popular High School; born 1838 in Copenhagen; educated at the theological school (1862). He volunteered in Dano-German War, 1864. In 1866 he founded Testruje High School; he received the degree of Ph.D., 1886. He believes that society is to be socialized, chiefly in accordance with the ideas of Henry George. Dr. Nørregård is the author of "Kristi Ore ag Menighedens Taro," 1877; "Ingemanns Digstirillingog Spencer," 1886. *Address:* Testruje, Marslet, Denmark.

NORTHAMPTON ASSOCIATION: A non-religious community, organized April 8, 1842, located near Northampton, Mass., owning some 500 acres, a silk factory, sawmill, six dwelling-houses, etc., valued in all at \$31,000. Its projectors were David Mack, S. L. Hill, George W. Benson, and William Adam. There were no "articles of faith," and very little to hold the community together. It dissolved Nov. 1, 1846. The cause of the failure seems to have been mainly a debt incurred in part on the original capital, which finally proved too heavy to be carried.

NORWAY: A monarchy with a constitution dating from 1814, and severing its connection with Sweden in 1905.

I. Statistics

Area, 124,130 sq. m.; population (1905), 2,311,000, or 18.62 per square mile. Lapps, 19,677; Finns, 7,777. Principal cities with population (1900): Christiania, 227,626; Bergen, 72,251; Trondhjem, 38,180; Stavanger, 30,613. In 1900 there were: 15,222 marriages; 66,149 births; illegitimate births, 4,824; deaths, 34,932; excess of births over deaths, 31,217. Emigration is on the increase; 6,699 left in 1899 and 26,784 in 1903; but only 21,050 in 1905. Of this number 93 per cent in 1903 went to the U. S.

Religion is almost exclusively the evangelical Lutheran, the only church endowed by the State.

Education is general, and has been compulsory for a number of years. The school expenses are borne partly by the communes, partly by the counties, and partly by the State. The total expenditure for primary education in 1903 was 11,391,000 kroner, supporting 6,017 elementary schools with 266,095 pupils in the country, and 2,697 classes with 84,309 scholars in towns. There are 90 secondary schools, with 16,332 pupils; 27 of these have higher departments for classics or mathematics; they are coeducational. Eighty-nine

private and communal schools give a more advanced education; 10 normal schools had 953 students. The university at Christiania has about 1,600 students. (See EDUCATION.)

Occupations are chiefly agricultural; 1,612,382, or 72 per cent of the population in 1900, living in rural districts, and 627,650, or 28 per cent, in towns. Owing to mountains, northern latitude, and numerous

Industries water-courses, only 3 per cent of the total area are under cultivation; 22 per cent under forest; and 75 per cent under grass or unproductive. There were 159,255 land proprietors, the vast majority of whom were small owners. The main crops are barley, oats, rye, potatoes.

Forestry is a great industry, the total area being estimated at 26,330 sq. m., 73 per cent of which is under pine and spruce. The State forests cover about 3,530 sq. m., and are administered by a special staff under the Minister of Agriculture. In 1905 Norway exported lumber to the amount of 34,963,800 kr., and wood pulp to 30,068,500.

Mining is unimportant, the total output being valued (1904) at 6,645,000 kr.—consisting principally of sulfur pyrites, copper, and silver ores.

Fisheries engaged (1904): in cod, 77,460 men; in herring, 11,226; in mackerel, 4,483. The total value of the output was 26,910,000 kr. Other fisheries, e. g., in the North Sea, deep sea for whale, walrus, seal, shark, etc., produced in 1904 a total of 7,587,000 kr.

Commerce.—The imports (1905) were 312,236,300 kr. (about \$36.22 per capita); exports, 188,920,200 kr. (\$21.91 per capita). Imports (1905) were chiefly from: Germany, 87,189,600 kr.; Great Britain, 77,748,000; Sweden, 38,469,800; Russia and Finland, 32,154,400; Denmark, 26,986,800. Exports to: Great Britain, 82,167,000 kr.; Germany, 31,412,700; Netherlands, 20,222,700; Sweden, 15,229,100; Spain, 13,225,500.

Shipping and Navigation was carried on by a mercantile marine of 5,843 sailing vessels with 808,768 tons, and 1,477 steamers with 642,057 tons in 1905. The principal ports are Christiania, Bergen, Trondhjem, and Frederikstad.

II. Constitution and Government

The present king is Haakon VII.; born 1872; elected by the Storting, 1905. The constitution, dating from 1814, vests the legislative power in the Storting. The king possesses the veto to a limited extent; he is commander-in-chief of the army and navy, and appoints to all higher offices.

The Storting meets every year for two months, and expires by limitation every three years. The king's permission is needed if the sessions extend over two months. All male citizens of twenty-five years may vote; election is direct. There are 123 Representatives; 41 from the towns; 82 from the country. They must be at least thirty years of age, residents of Norway for ten years, and voters in their districts. In 1903 the number of electors was 457,541, or 19.96 per cent of the total population; 236,650, or 51.72 per cent of the whole number, cast ballots. Women have the suffrage on questions of education and excise.

When in session, the Storting divides itself in two houses, the *Odelsting*—one fourth of the total members—and the *Lagthing*, the remaining three fourths. The rights and duties are those usually assigned to an "upper" and a "lower" house in legislative bodies; but common sittings are very frequent. The king is assisted by a cabinet of nine ministers.

The *finances* for 1905 were: revenue, 92,604,000 kroner; expenditure, 94,185,000 kr. The revenue came chiefly from indirect taxes and customs duties; the expenditure went chiefly to the State railways, army and navy, posts and telegraphs.

Railways have a total length (1906) of 1,584 miles, 1,347 of which are owned and operated by the State. The State railways received in 1905-6 the sum of 14,542,788 kr., and expended 10,860,731; surplus, 3,682,057; they carried 9,112,434 passengers. There were 2,836 post-offices in 1905; receipts, 6,200,000 kr., expenses, 7,648,124; deficit, 1,448,124.

The length of the State-owned telegraph lines

was (1905) 9,170 miles; receipts, 3,885,011 kr.; expenses, 2,718,876; surplus, 1,166,135.

The army is of the militia type, resembling that of Switzerland. The first and second lines comprise about 75,000 men, from the age of 22 to 34. The navy numbers about 1,500 men on permanent duty, with a large reserve, since all seafaring citizens between 22 and 38 years of age belong to the latter. (See MILITARISM.)

III. Social Reform

The best known social reform in Norway is its company temperance system. (See special article **NORWEGIAN COMPANY SYSTEM**. See also **TEMPERANCE**.) Poor relief is well provided for.

The communes are obliged to give relief. Settlement is gained only by two years of continuous residence. Differences are settled by the ecclesiastical ministry in the courts. The nearest relative must support where possible. Miners must and industrial regions can establish their own poor districts. Each district has a poor commission consisting of the pastor and persons chosen by the communal council. Any citizen may be required to act as a relieving officer without pay. The sources for relief are endowments, gifts, and a State fund, and repayment of expenditures. Institutions are rare, paupers mainly being boarded out. In 1894 only 2,390 were in poorhouses. Idleness and neglect to support a family are punishable by imprisonment or labor in a workhouse. Pauperism is extensive, but seems to be decreasing. Christiania has built a few blocks of artizan buildings and created a fund to be lent for the purchase of homes. Factory inspection and protection of laborers in mines and handicrafts exist. Child labor is restricted and education insured. Children under 14 may not be employed in factories, and youths from 14 to 18 not over 10 hours. Women may not be employed in mines nor with machinery, nor for six weeks after confinement. Adult men may not labor after 6 P.M. before a Sunday or a holiday nor till after 10 A.M. on a Sunday or a holiday.

By a law of 1894 working people are assured an indemnity in case of accident, and others may insure in the State office. About 80,000 persons are insured. The premiums are paid by employers and cannot be charged to employees. The indemnity is expenses of medical treatment after the fourth week. For the first four weeks, sick benefit clubs are supposed to meet the expenses; 60 per cent of the wages is paid for complete disability and less for partial. Funeral expenses and an annuity of not over 50 per cent of the wage are paid to the family in case of death. If the man is to blame, no indemnity is paid.

Cooperation has had considerable development. There were reported, in 1900, 830 co-operative dairies and cheeseries, and 260 stores, with 28,000 members. (See COOPERATION.)

Organized socialism entered Norway in 1885. In 1887 a Norwegian Labor Party was formed, and declared itself a Socialist party in 1889. It did not grow, however, till toward 1900. In 1897 it cast only 947 votes. In 1900, however, with a universal suffrage it polled 7,440 votes; in 1903, 24,779, and in 1906, 45,000. It elected in that year 10 deputies to the Storting. In 1901 it elected 31 municipal councilors, and in 1904, 75. The party is organized in 396 groups with 20,000

members. It has four dailies and nine other journals, published one, two, or three times per week. The leading journal is the *Social Demokrat* of Christiania. Considerable other literature is circulated. In 1905 the Socialists strove hard to make Norway adopt republicanism. The party is called the Norwegian Labor Party.

In Norway, as in other Scandinavian countries, the Socialist and trade-union movements are virtually one. All the trade-unions are federated in the *Arbeidernes faglige lands organisation i Norge*, and enroll 25,308 members.

NORWEGIAN COMPANY SYSTEM, THE: The Norwegian Company system is an attempt to control the traffic in spirituous liquors for the benefit of the community, and to reduce its evils to a minimum. It is often called the Gothenburg system, since it began in that city, tho in detail there is considerable difference between the Swedish and the Norwegian systems.

The system is a growth. At the beginning of the nineteenth century both Sweden and Norway had the largest per-capita consumption of spirits among civilized nations. Climate and other causes contributed to this result; but the ancient custom of drinking on every social occasion was, perhaps, the most powerful. There was also free trade both in the distilling and the sale of spirits, with very few limitations.

In order to check this, laws were passed in Sweden and Norway between 1845-55, forbidding free distillation, and putting both the manufacture and sale of spirits under government control. These laws benefited the country districts, but not the cities.

In 1865 a committee of the Town Council of Gothenburg reported proposing that the municipal authorities avail themselves of a provision of the law passed in 1855, and hand over to a company the licenses for the sale of brandy. (1) Neither capitalists nor liquor dealers were to

derive any profit from the traffic, so as to remove the temptation to push the sale. (2) Publicans could no longer give credit nor act as pawn-brokers. (3) Public houses were to be well lighted and ventilated, spacious and clean. (4) Food—well-cooked and wholesome—was to be supplied at moderate charges. (5) Liquor should no longer be sold to minors and intoxicated persons.

A company was formed, consisting of twenty highly respected firms and private individuals. The town council approved the recommendations, the magistrates sanctioned them, and the royal assent to the company's statutes was granted. Oct. 1, 1865, the company, or *Bolag*, took over thirty-six licenses, some of which it operated directly through its agents, others through sub-licenses. Its aims were: To make drinking more expensive; to lower the percentage of alcohol; to limit the quantity obtainable at one time by one person; to turn the saloon premises as far as possible into eating-houses; to reduce the number of drunkards both present and future; to reduce the time during which liquor could be obtained.

The law permitted the sale of liquor from 8 A.M. to 7 P.M. for home consumption and from 9 A.M. to 10 P.M. on the premises on week-days, and prohibited it on Sundays and holy days except to persons taking their meals in public places. The *Bolag* had a law passed that no saloons should be established in close proximity to a factory, and that they should have at least two rooms; it reduced the time for sale in the places it controlled to 6 P.M. in the winter and 5 P.M. in the

Industrial Reform

summer for all workmen; and to 6 p.m. all through the year on the eve of Sundays and holy days; on Sundays and holy days the *Bolag* establishments were open only from 1 to 3 p.m. to persons taking their meals there, when *brännvin* was supplied only as an appetizer. The law considered boys under fifteen as minors; the *Bolag* raised the age to eighteen, and limited the quantity to be sold to one person over the bar to 3 drams—not at too frequent intervals. The company, furthermore, established four eating-houses apart from the saloons where meals could be obtained from 7.30 a.m. to 9 p.m. on week-days, and from 1 to 3 p.m. and 6.30 to 9 p.m. on Sundays—with only one dram of brandy. In order to provide places where people might spend their leisure time profitably reading-rooms were established by the *Bolag*.

Owing to the fact that the *Bolag* obtained control of all licenses for spirits only in 1875, statistics before that date are misleading, since the public houses conducted for private gain had large sales, not only over the bar, but in half-gallon bottles for home consumption, from 1866 to 1874. The company's record really dates from that year.

SALE OF SPIRITS IN GOTHENBURG (IN LITERS)

| YEAR | Popu- lation | In the saloon | Per head | For home con- sump- tion | Per head | Total | Per head |
|--------|-----------------|------------------|-------------|--------------------------------------|-------------|-----------|-------------|
| 1875.. | 59,986 | 779,371 | 12.99 | 867,369 | 14.46 | 1,646,740 | 27.45 |
| 1885.. | 84,450 | 712,974 | 8.44 | 812,449 | 9.62 | 1,525,423 | 18.06 |
| 1895.. | 112,670 | 560,945 | 4.98 | 916,559 | 8.13 | 1,477,504 | 13.11 |
| 1899.. | 122,370 | 728,354 | 5.95 | 1,229,843 | 10.05 | 1,958,198 | 16.00 |
| 1900.. | 130,619 | 743,222 | 5.69 | 1,367,580 | 10.47 | 2,110,803 | 16.15 |
| 1901.. | 133,000 | 723,360 | 5.48 | 1,394,240 | 10.57 | 2,117,600 | 16.05 |
| 1902.. | 134,000 | 771,840 | 5.76 | 1,187,240 | 8.86 | 1,958,080 | 14.62 |

¹ Population for 1901 and 1902 estimated.

In order to better appreciate the decrease in the consumption of spirits, as shown by these figures, it must be stated that Gothenburg is surrounded by a prohibition zone, and that consequently a large part sold for "home consumption" goes to farmers and villagers near the city. In 1868 the *Bolag* had acquired all of the 61 licenses at the disposal of the town, altho some of them did not expire until 1875; it appropriated for public houses 27; transferred to hotels and clubs, 16; left unused, 18. There were consequently 43 licenses used, making one to every 1,172 of the inhabitants. The *Bolag* persistently reduced the number of licenses after the above date, and transferred more of them to eating-houses and hotels, where the sale of liquor was regulated by laws passed on its own initiative by the town council. It also reduced the percentage of alcohol from 50 and 47 to 44, and raised the price of spirits per glass from 6 to 8 öre, or about 25 per cent.

The good effect which the Gothenburg system had in reducing the consumption of spirits was soon noticed by other cities. The consequence was that they introduced it, with similar beneficial results. In 1896 their number was 92 with a total population of 1,006,666. Instead of giving figures for each of these towns to prove the beneficial action of the company plan, it may be better to give them for the whole of Sweden.

The total consumption of brandy was, in liters, in 1870, 43,004,162, or 10.3 per head; 1875—53,967,336, or 12.4; 1880—37,204,801, or 8.1; 1885—39,364,133, or 8.4; 1890—33,478,019, or 7.0; 1895—33,458,088, or 6.9; 1898—40,200,000, or 8.0. Concerning this increase in 1898, see below.

The company system of Norway is based on

that of Gothenburg, but differs from it in various important respects. The movement in Sweden

Norway

started from one city, and was more or less copied by other towns; but the decision as to local option, licenses, etc., was left with the town authorities; the *Bolags*, moreover, have never had full control of all the licenses in the towns and country districts. In Norway the system started from the central government. By the Act of May 3, 1871, the power to grant or refuse licenses was reserved to the Department of the Interior, at least by implication. Practically the right to allow the sale is expressly denied to the country districts—i. e., to 82 per cent of the total population in 1875—and also to 5 of the smaller towns. The central government holds, moreover, that the temptation on the part of towns to ask for licenses in order to reduce taxation by other means should be avoided by providing that the profits from the sale of liquor should not go to the defraying of expenses which the towns are bound to meet by regular taxation. Furthermore, the law of July 27, 1894, provided that the profits from the sale of liquor should be divided between the municipality, the company, and the State, the latter's share increasing constantly. In 1897, for instance, the town might get 15 per cent, the company 60, the State 25; but in 1901, when the law had taken full force, the proportion was 15, 20, and 65, respectively. The companies were by this law put in charge of the beer and wine licenses, and had a practical monopoly of the sale of all alcoholic beverages. The law also provided that all inhabitants of a town over twenty-five years old, whether male or female, should have the right to vote for local option or company licenses every five years. In order to reduce the number of wholesale dealers the law raised the amount of liquor which might be sold to an individual from 40 liters to 250, and exacted 1,000 kroner—about \$280—yearly for a license. The State thus discouraged the sale of spirits in every possible way.

In order to carry out its benevolent purposes the liquor traffic was put into the hands of companies, or *Samlags*, consisting of the most respected and philanthropic men in each town, under whose supervision reforms have been introduced similar to those in Sweden, e. g., in regard to reduction of licenses, cleanliness, credit, eating-houses, reading-rooms, etc. The hours of sale were, however, further restricted.

Christiansand was the first town to form a *Samlag*. Its example was rapidly followed by others. In 1891 all but 8 out of the 59 towns had formed *Samlags*; of these 8 the petition of 5 was denied, and 3 had private licenses.

To illustrate the operation of the company law, Bergen, the chief port and second city of Norway, may serve as an illustration.

Sale of spirits in Bergen (in liters), per head: 1877—2.45; 1885—1.68; 1895—1.35; 1899—0.96; 1901—0.87. Bars were abolished in 1902. The sales for home consumption remained practically the same, changing from 4.20 in 1897 to 4.99 in 1899, and 5.27 in 1905.

The sales in other cities were similar to those in Bergen. For the whole of Norway the total consumption of spirits was, in liters: 1875—11,842,000; per head, 6.0. In 1885—6,840,000; per head, 3.5. In 1895—7,111,000; per head, 3.5. In 1899—7,247,000; per head, 3.3. For Norway the consumption of absolute alcohol in brandy,

wine, and beer, per head, was: 1877—about 3.3 liters; 1885—about 2.4; 1895—2.5; 1898—2.5; 1905—1.98.

(1) The amount of spirits has gone down in both countries per head of the population; in Norway about 45 to 50 per cent. (2) The number of rum-shops has been reduced, e. g., in the towns of Norway from 501 in 1871 to about 130 in 1902, notwithstanding the increase in population.

Results

(3) The saloons have been divested of their various attractions to vice, e. g., immorality, gambling, etc. (4) Eating-houses, libraries, waiting-rooms, etc., have been established to act as counter attractions and serve as places where men may spend their leisure hours without temptation to drink. (5) The time for the sale of liquor has been reduced on week-days, and almost abolished on Sundays and holy days—the time of greatest temptation; and the age of minors has been raised from 15 to 18—the company's inns in Norway have, e. g., refused to sell liquor to about 872 minors, and over 26,000 intoxicated persons. (6) Considerable sums of money have been given for public purposes from the profits of liquor, e. g., the *Samlag* of Bergen turning over 2,652,723 kroner, or about \$736,865, from 1877-97; that of Christiania, 4,662,445 kr., or about \$1,249,535, from 1886-1903. (7) The liquor traffic has practically been eliminated from politics. (8) The people have been educated to a greater appreciation of sobriety, as is proved by the growth of the Norwegian Abstinence Society from a membership of 8,000 in 1876 to about 400,000 in 1906.

It must be confessed, on the other hand, that the system has not done all that was claimed for it: (1) The consumption of beer has largely increased in both countries, e. g., from 16.5 liters per head in 1875 to 45.0 in 1898 in Sweden, and from 12.3 in 1871 to 23.2 in 1899 in Norway. (2) The arrests for drunkenness have also increased in both countries, e. g., in Gothenburg from 39 per 1,000 population in 1875 to 58 in 1899; in Bergen from 20.6 in 1877 to 25.9 in 1899.

What are the causes of these facts? In Sweden wine and beer licenses have been left in the hands of private persons, and these made every effort to make up for the loss sustained through the transfer of the liquor licenses to the *Samlags*. It is admitted, moreover, that in smaller towns the company saloons have not always been well managed. In regard to arrests it may suffice to say that the sentiment in favor of punishing drunken persons is keener now than it was before, and does not necessarily argue an increase in drunkenness. Stockholm, for instance, shows a decrease from 49 in 1876 to 42 in 1898 per 1,000. The figures gradually decreased from 1876 to 1884, when arrests were only 24 per 1,000; then they rose again. As a matter of fact, the statistics of arrests for drunkenness can be explained only as a sign of greater or smaller strictness.

In conclusion it may be said that the company system has proved a success in both Sweden and Norway, particularly in the latter, since its laws were better framed and gave the

Conclusions companies complete control over alcoholic drinks in 1894. A gradual decrease in the consumption of both

beer and liquor has since taken place in Norway; e. g., in 1903 the decrease was 26,955 liters in liquor and 46,745 quarts in beer over 1902. If the laws have not done everything that was ex-

pected, one must bear in mind that men are not made sober by law, but by moral and religious influences; neither can customs, centuries old, be suddenly eradicated by a legal decree, but by the slow process of education.

NOYES, JOHN HUMPHREY: Founder of the Oneida Community; born 1811 at Brattleboro, Vt.; graduated from Dartmouth College and began to study law. During the great revival of 1831, being converted, he gave up his legal studies, and prepared for admission to Andover Theological Seminary; completed theological course at New Haven, Conn., and was there ordained a minister of the Congregational Church. The views of Christian doctrine he held at this time, particularly as to the possibility of living a sinless life, brought him into conflict with the authorities both of seminary and church. Surrendering his license, he began preaching independently, chiefly in Connecticut, Massachusetts, and Vermont, and in a few years was the acknowledged leader of a considerable body of disciples. Returned in 1836 to his father's home in Putney, Vt., where for the next eleven years he was engaged in publishing his new doctrines in periodicals, pamphlets, and books. During this period, with the members of his family and others, he formed a small community of about forty members; but the opposition of the town to the community was so active that in 1847 he and his associates withdrew from the place. Preliminary steps had been taken the previous summer toward forming a community in central New York, and to this place he and his disciples retired, leaving Putney. This movement resulted in the organization of the Oneida Community, with which the name of Mr. Noyes has ever since been connected. (See ONEIDA COMMUNITY.)

NUREMBERG (Medieval): We present here on its economic side a brief account of Nuremberg at the close of the Middle Ages, as in many ways typical of those ages and full of suggestiveness for modern times. We abridge the account from an article by W. D. P. Bliss in *The Outlook* (March 17, 1906):

Medieval Nuremberg was a city of success. This breathes from every point. *Æneas Sylvius*, who wrote in the fifteenth century, says: "The burghers' dwellings seem to have been built for princes. In truth, the kings of Scotland would gladly be housed so luxuriously as the ordinary citizen of Nuremberg." No one can doubt the substantial and widely distributed prosperity of the Burgher City.

One wonders still more at the high quality of its life. Equality here spelled Quality. Art, learning, religion, were universal. There was no artistic set, no learned class, no 5 per cent or 20 per cent who

Artistic Life attended church. In Nuremberg, more than elsewhere in the world, the artist was an artisan and the artisan an artist. Her greatest poet was a cobbler. When Adam Kraft carved his ciborium, that "miracle of German art," he represented himself and his assistants in working costume supporting the beautiful creation. Education, too, was popularized. If Gutenberg discovered printing with movable metal type in Mainz in 1455, Nuremberg, before 1500, had twenty-four presses and had printed 200 different works. Nuremberg was the first city in Germany, if not in the world, to found a gymnasium, a secondary school for the people. Equally was her religion for all. Vischer wrought his shrine "to the praise of God Almighty above and the honor of St. Sebald." Each trade guild had its patron saint, its saint's feast, its guild church or chapel.

It is this commingling of art and of commerce, of learning

and of trade, of religion and of daily life, that gives to Nuremberg its greatest charm.

Nuremberg was by no means a perfect city: its citizens were by no means ideal neighbors. The streets were ill kept, if not filthy. The 6,205 "poems" of Hans Sachs were often coarse. The government of the city was habitually cruel and harsh, even when just. The subterranean passages under the Rathaus, the dark dungeons of the castle, the torture-chamber with its horrors, above all, the "Iron Virgin," deliver us from any sentimental desire for the return of "the good old times." Nevertheless, just this, that out of such darkness and ignorance and evil there did arise such art and freedom, such individuality and success, makes us hasten to ask the question how it all arose.

We do not hesitate to answer: It arose first and foremost—we do not say solely—because Nuremberg was a city of gild rule. No Nuremberger ever seriously dreamed of leaving trade or art or manufacture, or indeed any portion of life, to the accident and incident of unrestricted competition. "Competition," the Nuremberger would have said, "is the death of trade, the subverter of freedom, above all, the destroyer of quality." Every Nuremberger, like every medieval man, thought of himself, not as an independent unit, but as a dependent, altho component, part of a larger organism, church or empire or city or gild. This was of the very essence of medieval life. According to the theory of the times, the town held the right to practise trades as a feudal tenure from the

Economic Basis

emperor, who held it from God. This tenure—the right to practise trades—the Rath, or Town Council, parceled out between the gilds or groups of citizens, each gild having the right to practise only that art or subdivision of art granted it by the Rath. Finally, in its turn, the gild granted to its different individual members the right to practise the trade, conditioned, however, upon restrictions and within very definite limits. The gild determined what raw material might be bought and how much, the number of apprentices any master might employ, and the conditions under which they should work. It determined the number of journeymen in any shop, and the wages they were paid. It held the right to determine, and often did determine, the very methods and mechanism of production. Above all, it fixed the price of the finished product and scrupulously controlled the market.

It will be said, with truth, that the medieval trade-gild was not like the modern trade-union, in that the latter is composed of operatives only, while in the medieval gilds master and workman, employer and employee, tho with first order of precedence, nevertheless sat and voted in the same gild. This was true, at least, in the period in which Nuremberg was laying the foundations of her great development. We are not forgetful that the system did not endure. Even under a beneficent feudalism the interests of labor and capital, inherently diverse, broke forth in open strife in Nuremberg as early as the fourteenth century. The artisans formed a new council composed mainly of artisans. This council did not endure, but it sowed the seeds of lasting conflicts between the masters and the men, and the struggle went on till the power of the old gilds was forever gone. But it shows how much Nuremberg owed to the old system.

Take the vexed question of apprenticeship. The gild, as we have seen, determined the number of apprentices. According to the rules of the times, the master "must maintain his apprentice night and day in his house, give him board and attention, and keep him under lock and key." It does not sound very free, nor very inviting; but listen. The master had to teach the apprentice his trade, with all its mysteries. He must keep no secret back, on pain of losing his license to trade. When the apprenticeship (*Lehrjahre*) expired, the young worker was given time and money to travel and study his trade in other countries, for one, three, or even five years (his *Wanderjahre*). If he was an iron-worker, he would go to the Low Countries and see the marvelous iron-work of Antwerp and Liège. If he was a silversmith or goldsmith, he would go to Florence and North Italy. Finally, when he came home, when his *Wanderjahre* were over, then, while working for a master, he was required to make a masterpiece, and only when he had done this and proved himself a master workman could he be admitted to rank as a master in his craft. Do we wonder still that Nuremberg workmanship was renowned?

It will be said that Nuremberg's success was based upon thorough training. But it was the gild rule that made this training possible. The gild did not allow the untrained workman or the mean-spirited trader to cut prices to spoil or steal the market. The gilds measured and weighed and tested all materials, and determined how much each pro-

ducer could have. The gilds said where materials should be bought. No open market or free trade for them. They equally measured or counted, weighed and tested, the finished product. No dishonest goods, no adulterated wares, were to be foisted on the market to deceive the purchaser or lower the price. As late as

Gild Rule

1456 two men were burned alive at Nuremberg for having sold adulterated wines. Wares, the gild laws said, must be, "in the eyes of all, good, irreproachable, and without flaw." To buy in the cheapest and sell in the dearest market was not Nuremberg's commercial law. The gild regulations, indeed, went into every possible and even absurd detail. The gild laws determined even what the artisan should wear and eat. It was a quarrel over this latter item that largely led to the disruption of the old gilds and the development of the journeymen's gilds.

But it was not only in economic matters that the gilds held sway. They legislated in the realm of morals and behavior. Only the right of life and of limb was reserved to the emperor. The gilds were charitable and benefit societies. The gild system covered the whole domain of life and entered every province. Even the poets had their gild.

Nuremberg, however, was not unaware of the dangers of combinations. A receipt of a commission of the Reichstag, held in Nuremberg, 1522-23, says:

"Item: The aforesaid monopolies, uniting, combining, associations and their sellings, have not now for the first time been found out not to be borne; but the same were regarded as very noxious to the commonweal and distinctive and worthy to be punished, as aforesaid by the Roman emperors and juriconsults, and especially by the blessed Emperor Justinian, so that such trespassers should be made to lose all their goods, and, moreover, should be adjudged to eternal misery [exile] from their homes, as standeth written. . . . *Legis Unica Cod. de Monop.* . . . But therefore it is not said that all companies and common trading should be wholly cut away. This was indeed against the commonweal and very burdensome and harmful and foolish to the whole German nation. . . . If each one trade singly and should lose thereby, that would then be to his undoing. . . . such a forbidding would only serve the rich and their advantage, who in all cases everywhere do pluck the grain for themselves and leave the chaff for others."¹

Nuremberg thus saw very well that competition only served the rich and the strong, that collective trading was the hope of the poor and the plain people. The gilds were therefore encouraged but controlled. According to the receipt, they could have a capital of only 50,000 gulden, with three storehouses, outside family stores. They must make sworn reports to the town councils. Dispersed companies were not to join. Only limited amounts of material could be bought. They were to be trading companies. Money was not to be lent on usury (interest). The gilds were to serve the people, not to become their masters. Indeed, the gild system cannot be rightly judged unless one take into consideration the control of the gilds by the Rath or town council. This was paternal, often socialistic in the extreme. It was, as we have seen, cruel—but it was with a just cruelty. Extortion, false measures, adulteration of goods, were abominations in a trading town and punished usually by death. There was to be no cornering of the market. This was particularly so in the matter of food. The town built granaries and filled them with grain against the day of drought, when they could be opened and the grain sold at low prices to prevent a monopoly price. The town government, if not by the people, was of the people, and for the people.

Such, in brief, was the system that produced Nuremberg's art and commerce. It most certainly developed freedom and individuality. The first gunlocks, the first air-guns, the first clarionets, the first globes, were made in Nuremberg. In 1500 Peter Hemlein made the first watches, and they were called Nuremberg eggs. The first paper-mill in Germany, if not in Europe, was established here. A machine for drawing wine was invented in Nuremberg. Printing, as we have seen, tho not discovered here, was early introduced. The first playing-cards were printed here; still to-day Nuremberg is the great manufacturer of toys. Marvelous quality of work, equality of effort, freedom in inventiveness and creation, grew up largely because by the gild laws the Nuremberg man found deliverance from competition in cheapness of work and of prices.

O

OASTLER, RICHARD: English reformer; born in Yorkshire, near Huddersfield, 1789, and succeeded his father as steward to Mr. Thornhill, living at Tirby Hall. Early interested in the abolition movement; he suddenly became aware that there were slaves in England. In a letter to the *Leeds Mercury*, in 1830, he exposed some of the evils existing in the neighboring mills. Agitation was aroused, and a bill was laid before Parliament by Lord Morpeth, limiting the hours of work and raising the limit of age for work in the mills. The opposition of the manufacturers was bitter, and they succeeded in getting the bill amended so that it was almost useless. Calumny was heaped upon Oastler, but he did not swerve from his course. His advice to the working classes was, "Let your politics be 'ten hours a day and a time book.'"

Oastler now became associated with T. Hobhouse and M. T. Sadler (members of Parliament); and, in 1831, Sadler introduced a ten-hours bill into the House of Commons. The bill did not pass, and in 1832 Sadler lost his seat.

Another leader, however, appeared, Lord Ashley, afterward Earl of Shaftesbury. The mass of testimony which Oastler had produced showed that it was the custom to employ children, from five years old upward, from five in the morning till ten at night, and that during the whole time they were on their feet, with a short interval for dinner. Several cases of death resulting from beatings were proved. Lord Ashley brought in a ten-hours bill for women and children in 1833. A government bill was, however, finally accepted by Oastler and Lord Ashley, as the best that could be procured. While it did a certain amount of good, it permitted manufacturers to act as justices and punish offenses committed by members of their own body; and, naturally enough, punishments were few, while infractions of the act were many. The law was so openly disregarded that Oastler began his campaign afresh. The cry went out, "Yorkshire slavery still exists." As a result the government was finally obliged to promise to enforce the factory acts.

In the midst of his work Oastler was cast into prison for a debt which had been incurred in keeping up his position and pursuing his labors. From Fleet Prison he each week issued a journal called *The Fleet Papers*, devoted to a discussion of factory and poor-law questions. After five years' imprisonment his friends subscribed enough to clear him from debt, and he was released. His entry into Huddersfield was made a great public event, and crowds of people thronged to greet their liberated champion.

Oastler's final victory was gained in 1847 by the passage of the Ten-Hour Bill of that year.

Oastler's wife died soon after his release from prison, and his remaining years were passed in seclusion and poverty. He died in 1861 at the age of seventy-two, "The Old Factory King," as his admirers called him, an example of self-sacrifice and devotion.

OBERHOLZER, SARA LOUISE: Authority on school savings-banks (*q. v.*); born in Uwchlan, Pa.; educated in Friends' schools; president of various literary and philanthropic societies; superintend-

ent for School Savings-Banks department of the National and World Woman's Christian Temperance Union, and has been personally instrumental in placing the system in a very large number of schools. Besides literary works in prose and verse, she has written numerous pamphlets and articles upon school savings-banks. *Address:* 1905 Tioga Street, Philadelphia, Pa.

O'BRIEN, JAMES BRONTERRE: British reformer; born in Longford, Ireland, 1805; educated in the school conducted by Miss Edgeworth, the novelist, and Dublin University, where he won honors and gathered around him a brilliant coterie of admirers and friends. He entered Gray's Inn, London, and fell under the influence of Cobbett and Hunt, and was drawn into the radical movement. He became one of the leaders of the Chartist cause, and was widely known as "the Chartist Schoolmaster." He was several times arrested and sent to prison. He emphasized the economic aspects of the Chartist movement, and to some extent was a precursor of Karl Marx and apparently the first to use the term "surplus value." He also called himself a "Social Democrat" and urged the formation of a "Social Democratic Party," being the first writer so far as is known to use the terms which have become so significant. For years he edited the most influential Chartist organ, *The Poor Man's Guardian*. He published a translation of Buonarrotti's "History of Babeuf's Conspiracy for Equality," with a valuable introduction and copious notes; "Life of Robespierre"; "Human Slavery: How It Came Into the World, and How It Shall Be Made to Go Out" (posthumously issued in 1885). O'Brien died in 1864. J. S.

OCCUPATIONS: The following world statistics are taken from the German *Statistisches Jahrbuch für das Deutsche Reich* for 1906:

Agriculture and fishing employ the largest proportion of the bread-earners in this order: Hungary, Italy, Russia, Austria, Sweden, Denmark, France, Norway, Germany, Switzerland, the U. S.

Manufacture and mining employ the largest proportion of the bread-earners in this order: Scotland, England and Wales, Belgium, Switzerland, Holland.

The largest proportion of bread-earners engaged in commerce are in Holland, the U. S., Norway, England and Wales, Scotland, Denmark, Belgium, Switzerland, Germany.

The largest proportion in the army and navy are in Russia, Germany and France; the smallest number are in Switzerland, the U. S., Scotland, and Norway.

The largest proportion in public or professional life are in Great Britain, Holland, France, Italy, Russia, Germany.

The largest number in domestic or personal service are in Belgium, the U. S., Great Britain, Ireland, Norway, Sweden, Holland, Denmark.

The first two tables on page 844 give the occupations for the principal countries of the world. The first gives the actual numbers, the second the percentage in the same order as the first. Some interesting figures will be noticed, e. g., that the comparatively poor countries have the largest percentage of domestic servants.

| COUNTRIES | Year | Agriculture, forestry, fishing, and dependent occupations | Industries, mining, hotels and inns | Commerce and transportation | Army and navy, police | Public service and professions | Domestic and personal service | Other occupations |
|--------------------------------|------|---|-------------------------------------|-----------------------------|-----------------------|--------------------------------|-------------------------------|-------------------|

¹ For example, 61.1 per cent of the men in Germany are bread-earners and 25.0 per cent of the women. Of both together 42.7 per cent are bread-earners out of 100 of the population.

THE UNITED STATES

Compiled from the Census of 1900

POPULATION AT LEAST TEN YEARS OF AGE ENGAGED IN GAINFUL OCCUPATIONS

| COUNTRIES | Number | Per cent of population ten years of age | | |
|------------------------------|------------|---|------|------|
| | | 1900 | 1890 | 1880 |
| United States..... | 29,285,922 | 50.3 | 48.0 | 47.3 |
| North Atlantic Division..... | 8,579,275 | 51.4 | 50.2 | 47.1 |
| South Atlantic Division..... | 4,000,691 | 52.5 | 48.6 | 50.7 |
| North Central Division..... | 9,580,913 | 47.2 | 45.4 | 44.1 |
| South Central Division..... | 5,209,755 | 51.5 | 46.6 | 49.7 |
| Western Division..... | 1,703,483 | 52.7 | 55.7 | 55.4 |

The figures indicate a slight increase in the proportion of the population engaged in gainful occupations, except in the Western Division. This increase is due undoubtedly to the entry of women into gainful occupations, and the fall in the West is doubtless due to the changing character from a population largely male, to one with more married women and children over ten. The states in 1900 having the largest proportion engaged in gainful occupations were Wyoming, South Carolina, Montana, Alabama, Mississippi, Arizona, Nevada, and Rhode Island. Those having the smallest were Utah, Kansas, Indiana, Iowa, West Virginia, South Dakota, and Nebraska.

OCCUPATIONS BY AGES

| | 10-15 | 16-24 | 25-34 | 35-44 |
|-----------------------------------|-----------|-----------|-----------|-----------|
| Agricultural pursuits..... | 1,062,251 | 2,544,120 | 2,080,773 | 1,721,002 |
| Professional service..... | 2,956 | 308,916 | 405,673 | 251,650 |
| Domestic and personal..... | 280,143 | 1,767,389 | 1,436,068 | 996,742 |
| Trade and transportation..... | 122,507 | 1,265,795 | 1,389,612 | 990,356 |
| Manufacturing and mechanical..... | 284,330 | 1,869,776 | 1,927,966 | 1,453,227 |
| All occupations..... | 1,752,187 | 7,755,996 | 7,240,092 | 5,412,977 |

| | 45-54 | 55-64 | Over 64 | Unknown |
|-----------------------------------|-----------|-----------|-----------|---------|
| Agricultural pursuits..... | 1,437,439 | 936,620 | 631,440 | 26,574 |
| Professional service..... | 153,655 | 88,947 | 48,398 | 4,341 |
| Domestic and personal..... | 645,089 | 357,273 | 177,767 | 33,307 |
| Trade and transportation..... | 573,962 | 289,387 | 130,226 | 10,448 |
| Manufacturing and mechanical..... | 893,177 | 447,446 | 216,235 | 20,147 |
| All occupations..... | 3,703,262 | 2,117,673 | 1,204,066 | 100,817 |

The figures indicate for the country generally a lessening number engaged in agriculture, a slight lessening in domestic and personal service, somewhat of a gain in manufacturing and mechanical pursuits, a large gain in trade and transportation.

Among women engaged in gainful operations the proportion engaged in agricultural pursuits and in domestic and personal service is falling

off; a somewhat larger number are engaged in manufacturing and mechanical pursuits and in professional service; the main gain is in trade and transportation, as clerks, saleswomen, cash-girls, typewriters, etc. By far the largest number of women, however, are still engaged in domestic and personal service, and the next largest number in manufacturing and mechanical pursuits. Only 8.1 per cent are engaged in professional service.

| CLASSES OF OCCUPATIONS | Males | | | Females | | |
|-----------------------------------|-------|------|------|---------|------|------|
| | 1880 | 1890 | 1900 | 1880 | 1890 | 1900 |
| Agricultural pursuits..... | 92.3 | 92.1 | 90.6 | 7.7 | 7.9 | 9.4 |
| Professional service..... | 70.6 | 67.0 | 65.8 | 29.4 | 33.0 | 34.2 |
| Domestic and personal..... | 65.5 | 60.5 | 62.5 | 34.5 | 39.5 | 37.5 |
| Trade and transportation..... | 96.6 | 93.1 | 89.4 | 3.4 | 6.9 | 10.6 |
| Manufacturing and mechanical..... | 83.3 | 81.9 | 81.5 | 16.7 | 18.1 | 18.5 |
| All occupations..... | 84.8 | 82.8 | 81.7 | 15.2 | 17.2 | 18.3 |

Men are thus seen to be in an overwhelming majority in all classes of occupations, the women are slowly gaining on them in each class. The following table gives the details for each of the occupations represented in the census:

| OCCUPATION | Male | Female | Per Cent Male | |
|---|------------|-----------|---------------|-------|
| | | | 1900 | 1890 |

According to the above figures, the proportion of males has increased from 1890 to 1900 in 29 occupations; the proportion of females has increased in 86 occupations, and in 25 there has been no change, or it is unknown through change in classification. Most of these changes of proportions, however, have been very minute. The only occupations in which men have increased over women more than 1 per cent are as dairymen, artists, in domestic and personal service, as servants and waiters, as telegraph and telephone linemen, in paper-mills, as milliners, tailors, and in a few factories. Here they have gained slightly.

The occupations in which women have gained more than 1 per cent are: as farmers (1.1), gardeners (1.3), as stock-raisers (1.3), as actors (3.2), architects (1.6), clergymen (1.7), journalists (3.2), in literary pursuits (6.8), music (1.3), in government offices (3.5), teachers (2.6), physicians (1.3), other professional services (10.9), as boarding-house keepers (9.9) hotel keepers (3.6), housekeepers (1.2), janitors, (3.6), laborers (1.8), nurses (2.9), restaurant keepers (1.8), agents (1.6), bookkeepers (11.7), clerks and copyists (2.0), messengers and errand boys (cash girls, etc.) (3.6), packers and shippers (7.5), saleswomen (2.3), stenographers and typewriters (13.0), telegraph and telephone operators (13.9), undertakers (1.2), potters (4.9), bakers (1.7), confectioners (5.1), boot- and shoemakers (3.2), tanners (3.6), leather-case makers (9.3), clock and watch makers (1.4), gold- and silver-workers (7.9), bookbinders (3.1), box makers (8.5), in hosiery knitting mills (2.8), hat and cap makers (5.6), shirt makers (2.8), brush makers (3.9), glove makers (6.0), photographers (2.3), tobacco-workers (8.0).

The occupations in which women have made the largest gains are: professional service (10.1), boarding-house keepers (9.9), bookkeepers (12.6), stenographers and typewriters (13.0), telegraph and telephone operators (13.9) (the largest advance), trunk and leather-case workers (9.3).

Women are in a majority in only nine occupations—musicians or teachers of music, school-teachers, boarding-house keepers, housekeepers, laundresses, nurses, servants, stenographers, and typewriters.

Men are over 90 per cent of the workers in 87 out of 303 occupations.

GREAT BRITAIN

According to the census of 1901 in England and Wales, the proportion of persons in each million

employed in the twenty-two classes into which they are divided is as follows. The figures are of males aged ten years and upward:

| CLASSES | 1881 | 1901 | In-crease | De-crease |
|---|-----------|-----------|-----------|-----------|
| 1. Government..... | 10,373 | 14,149 | 3,776 | |
| 2. Defense..... | 11,494 | 13,865 | 2,371 | |
| 3. Professions..... | 24,781 | 25,681 | 900 | |
| 4. Domestic service..... | 8,044 | 10,741 | 2,697 | |
| 5. Commercial..... | 33,112 | 43,734 | 10,622 | |
| 6. Conveyance..... | 83,985 | 102,844 | 18,859 | |
| 7. Agriculture..... | 138,327 | 95,510 | | 42,817 |
| 8. Fishing..... | 3,157 | 1,955 | | 1,202 |
| 9. Mining..... | 55,926 | 65,944 | 10,018 | |
| 10 and 11. Metals..... | 90,482 | 107,208 | 16,726 | |
| 12. Building and construction and sanitation..... | 84,621 | 98,448 | 13,827 | |
| 13-17. General manufactures..... | 54,817 | 61,432 | 6,615 | |
| 18. Textiles..... | 51,762 | 40,561 | | 11,201 |

| 20. Food and drink..... | 59,088 | 63,810 | 4,722 | |
| 21. Pawnbrokers, hawkers, etc..... | 7,110 | 6,695 | | 415 |
| 22. Laborers..... | 78,803 | 50,802 | | 28,001 |
| Total occupied..... | 833,067 | 837,050 | 3,983 | |
| 23. Unoccupied..... | 166,933 | 162,950 | 3,983 | 3,983 |
| | 1,000,000 | 1,000,000 | | |

A writer in the London *Times* finds that the age constitution of the population has changed, and that the proportion of adults is considerably higher than it was twenty years ago—33.7 per cent. But in spite of this the proportion of occupied persons is smaller—28.3 per cent (not of males alone but of men and women together). A wholly disproportionate increase of 41.2 per cent has taken place in the number of persons occupied in those callings which chiefly supply unemployed, and he groups them under the heading of "trade and transport services." He opposes these to the productive industries, which show only an increase of 19 per cent. The number of persons occupied in trade and transport has increased at a far more rapid rate than the general population, or the occupied population, or the number of those engaged in productive industries.

In 1905 there were employed in Great Britain in agriculture some 2,000,000 persons; fisheries, 106,793 (36,498 English, 42,727 Scotch, 25,635 Irish); 887,524 in mining; in 1901 there were employed in textile factories 1,029,353, of which 650,142 were females (16,898 males and 19,613 females were under the age of 14); in 1905, 263,688 were employed in shipping and navigation, of whom 39,711 were foreigners and 43,483 were Lascars.

OTHER COUNTRIES

For other countries see those countries.

O'CONNELL, JAMES: President of the Association of Machinists; born Minersville, Pa., 1858; educated in the common schools; apprenticed to the trade of a machinist, followed this occupation until 1893; early an active worker with organized labor, he was elected president in 1893 of the International Association of Machinists, and re-elected every year since. Since 1895 he has been vice-president of American Federation of Labor. Since 1898 he has devoted his entire time to the trade-union movement. Mr. O'Connell is a thorough believer in trade-unionism and believes that the wage-workers should take such political action as will secure the election to public office of men who will work for the enactment of laws that will make for the advantage of the whole people. Address: 405 McGill Building, Washington, D. C.

O'GRADY, JAMES: English Labor member of Parliament; born Bristol, 1866. Apprenticed to a furniture maker, he joined the union of his trade and traveled through England as organizer. Returning to Bristol in 1890 he was elected to the city council, and instrumental in obtaining scholarships for public schools. Was president of the Trade-Union Congress at Bristol, 1898. He successfully organized the National Amalgamated Furnishing Trades' Association, which he has represented in France, Stuttgart, and Boston. He is also on the executive of the General Federation of Trade-Unions and the Shipbuilding Trades Federation. Elected to Parliament 1906, for Leeds, East. Address: 26 Kyrle Road, Clapham Common, S. W.

OIL, ILLUMINATING (Petroleum and Natural Gas): Mineral oil has developed in modern times large economic importance, partly because of its large and increasing use, and partly because in the Standard Oil monopoly it has developed the first, most prominent, and in some respects the greatest monopoly of the world. Mineral oils, however, have been known for centuries, as in the naphtha fields of the Caspian Sea. Pennsylvania has had an important oil industry over forty-one years. The Standard Oil monopoly began under the name of the South Improvement Company in 1872, and by 1874 had its system of rebates from the railways well under way. Since then it has had virtually a monopoly, having absorbed or in some way destroyed virtually all attempts at competition, and controlling at present some 22,000,000 barrels of oil out of a product of 26,000,000 barrels. From 1898-1902, however, Russia produced more petroleum than the United States. According to the Geological Survey, over 5,000,000,000 gallons of petroleum are now produced annually in the world, of which 2,500,000,000 are produced in the U. S., 2,250,000,000 in Russia, and the remainder among a dozen countries, Austria producing 87,000,000; Sumatra, 72,000,000; Java, 30,000,000; Canada, 29,000,000; Germany, 15,000,000.

The following shows the oil production of the U. S.:

OIL PRODUCTION IN THE UNITED STATES
(Compiled from the U. S. Geological Survey)

| YEAR (ended June 30) | Production ¹ | Imports ² | Exports | Per cent of product exported |
|-------------------------------|-------------------------|----------------------|---------------|------------------------------------|
| | Gallons | Gallons | Gallons | |
| 1882... | 1,161,771,996 | 650 | 683,690,563 | 58.85 |
| 1885... | 1,017,174,396 | 983,190 | 683,989,560 | 67.24 |
| 1890... | 1,476,867,546 | 721,932 | 783,996,824 | 53.09 |
| 1895... | 2,072,469,672 | 942,503 | 1,051,889,401 | 50.76 |
| 1900... | 2,396,975,700 | 18,574 | 1,081,744,231 | 45.13 |
| 1905... | 4,916,663,682 | 1,148,774 | 1,205,798,422 | 24.53 |

¹ The production is of the calendar year preceding the fiscal year.

² Includes net imports of mineral oil to 1897; from 1898 to date imports for consumption of mineral oil and petroleum, crude, and refined reduced to crude.

The main oil-fields in the U. S. are the Appalachian, a central field in Ohio and Indiana, in California, Texas, and smaller ones in Kansas, Colorado, and Wyoming. The fields in Ohio and Indiana are about exhausted; the Western supply is increasing, but the California product is chiefly suitable for fuel. The Texas oil seems

suitable for light and fuel, tho inferior for light to the Appalachian, which is the main supply and carried in gigantic tubes to the Atlantic coast. New sources have been somewhat recently discovered in Pennsylvania and West Virginia.

OLD-AGE PENSIONS: Old age has been shown by recent investigations to be, if not the chief, at least among the two or three chief causes of pauperism. It is therefore very seriously proposed to pension all aged persons. In continental Europe several countries have already entered upon large and important experiments in this direction, so that there already exists considerable information upon the subject.

While in England the credit for the first serious agitation of the subject belongs to Canon Blackley, it is to the investigations of Charles Booth that we owe the most careful plea for the establishment of such pensions. Mr. Booth, in his investigations in East London, came to the conclusion that old age was the chief cause of confirmed pauperism, and subsequent and more extended investigations have made him declare that the paupers in England and Wales under sixty are only 4.6 per cent of the population under sixty while those over sixty-five are 26 per cent of the population over sixty-five, so that the increase from 4.6 to 26 per cent is the measure of the direct or indirect effect of old age upon pauperism. (See Mr. Acland's Introduction to J. A. Spender's "The State and Pensions in Old Age," p. xviii.) He states that the number of the aged who receive public aid in the different parishes rarely falls under one third and rises often to one half.

In old-age pensions, however, the prime place belongs undoubtedly to Germany. She was the first country to introduce old-age pensions on a large scale, and her system has already had an extensive trial. Her old-age insurance, as a part of her industrial insurance system, began June 22, 1889. It has grown to very large proportions. (But for it, see INDUSTRIAL INSURANCE IN GERMANY.)

The French have done less. France's system of insurance for old age is sufficient as far as it goes, but is inadequate in extent. After the Revolution of 1848, a *Caisse de Retraites*, or National Pension Bureau, was proposed, and has continued in one form or another to occupy the attention of French legislators since. The law of 1850 provided that the capital should consist of deposits, to be not less than five francs; 5 per cent interest was guaranteed. This proposition was sufficiently alluring for the bourgeoisie to take advantage of and the *caisse* was established. The amount to be deposited, the interest guaranteed, and the annuities to be paid were consequently limited—the latter to \$150, \$200, or \$300, respectively. The *caisse* has gradually become an institution for the middle classes instead of for the poor. In 1871 the interest was raised to 5 per cent, and by 1882 there was a deficit of \$8,400,000. The State settled this, and reduced the interest; but the number of depositors also decreased one half, and the amount of pensions sank to \$1.70 per month. In 1891 M. Constans, Minister of the Interior, proposed a bill whereby every workingman who does not explicitly declare his unwillingness to do so was to pay either one or two cents a day for seventy-five days per annum from his twenty-fifth to his fifty-fifth year. This

contribution was to be doubled by the employer. The State was to add to this amount two thirds besides conducting the insurance and guaranteeing the interest—making the pensions \$60 or \$120, respectively. The pension was to be limited to French citizens, both male and female, who at twenty-five earn less than \$600. In order to prevent employers from engaging foreigners, a tax was laid on all foreign working men.

This, too, was tried, but proved inadequate, since it was to a large extent voluntary, and led employers to induce their working men to declare their unwillingness to receive aid before a magistrate. The State's contribution from 1897-1905 was 590 francs per annum. In that year a new law was passed, making provision for this fund compulsory and dividing the burden between the State, the departments, and the communes, so that the first contributes 27,000,000 fr.; the second, 11,000,000; the third, 18,000,000. According to the law "every French citizen, without resources, incapable of earning a livelihood, either on account of infirmity or incurable disease, is entitled to assistance." The amount thereof is to be not less than five francs per month, nor more than twenty, save under exceptional circumstances. The law was enacted in Feb., 1906, and every workingman comes under its provision at the age of eighty-five. But by a change in a clause, the law requires contributions from the employers and employees in addition to those of the government.

The Danish Government passed a law in 1891 laying a tax on beer, and applying a portion of the revenue to old-age pensions. All persons over sixty years of age receive an *honorary pension*, without any cost to themselves—provided they have not received poor relief, have lived in Denmark at least ten years previous, and are of good reputation. Aid is given in kind, cash, or institutions (not poorhouses). The State levies a fund for the purpose, from which the commune may receive one half its expenditure for the aged. In Jan., 1893, there were 30,957 persons in receipt of old-age relief; in Jan., 1902, 44,118. The law is believed to have worked well, tending to keep people from committing crime, and from applying for poor relief in order to be entitled to this pension. Its cost is thus fully saved by the reduction of expenses for poor relief. The cost in 1901 was £306,830. (See also article DENMARK, p. 382.)

The Belgians have had a pension fund of some sort since 1850 in connection with the State Savings-Bank. It permits the establishment of pensions, not over 1,200 francs, and made payable at different ages, chiefly between fifty and sixty. This has become of particular importance since the granting by the State, in 1900, of premiums to persons entitled to a pension through the endowment of a Friendly Society, or to persons of modest means, directly connected with the institution. The law is, consequently, permissive, and not compulsory, and, therefore, inadequate to that extent.

In Italy the question of old-age pensions was considered as early as 1887. Two years later a committee was appointed by the Chamber, which reported in July, 1890. The proposed bill provided that a special fund be established in connection with the banks of issue and deposit,

Denmark

Belgium

Italy

Germany

France

the interest on it to be devoted to pensions for laborers over sixty years of age. The fund was to be derived partly from contributions by members, to the extent of 500 lire or less per annum, partly from certain consignments of shares in the savings-banks, and other public sources. It was not enacted.

The question of old-age pensions is being agitated in Austria and Sweden, particularly in the former country, which already has compulsory sick and accident insurance.

The question of old-age pensions has been agitated in England since 1772; but action has been deferred by Parliament. In 1865 opportunity was given for purchasing annuities through the post-office; but only about 21,000 persons had bought them up to 1895. Canon Blackley

England

proposed that every person, without distinction of class or means, should pay £10 between the years of eighteen and twenty-one, which was to yield the wage-earners 8s. a week sick pay, and 4s. week pension after the age of seventy. The National Provident League favored the idea; but a select committee of the House of Lords, appointed 1885, reported adversely in 1887, waiting for "further development of public opinion." Mr. Charles Booth computed the number of persons over sixty years of age, receiving poor relief, at 331,596, and proposed on this basis that a minimum pension of 5s. per week be paid to every person over sixty-five years of age, irrespective of class, wealth, or rank. The total cost was calculated to be about £14,000,000.

In 1899 Mr. Chamberlain appointed a select committee of the House, and declared old-age pensions to be out of the realm of party politics. The committee reported that persons over sixty-five years of age, with a clean record for ten years, with an income of less than 10s. per week, should be entitled to a weekly pension of 5s. On the basis of the census of 1901, the number of people over sixty-five years in the United Kingdom was estimated at about 2,000,000. Of this number only about 650,000 would be entitled to the pension, making a total of £10,300,000 if the pension should vary between 7s. and 5s. 6d. The cost has since been estimated at £13,000,000. At the general elections, Oct. 28 to 30, 1900, a number of members were elected subject to the pledge of supporting "pensions for all as a civil right." In 1901, Feb. 19th, a bill was introduced into Parliament to provide pensions for the aged poor. It was backed by Messrs. Channing, Burt, Burns, John Wilson, Broadhurst, and Sir Walter Foster. A similar bill was introduced March 19, 1902. Numerous meetings have been held by trade-unions, Friendly Societies, etc.; the movement has been indorsed by prominent philanthropists and clergy; the scheme has been indorsed at numerous meetings by delegates, representing upper, working, and middle-class people, but—nothing has been done. The latest proposal is that of the National Committee of Organized Labor, adopted Feb. 7, 1903, at Birmingham. It provides for a pension of 5s. per week to every British subject, male or female, over 65 years of age—excepting subjects domiciled outside of the United Kingdom; persons having lived less than twenty years within its borders, being under police surveillance or having been sentenced for a crime. It has not been introduced into Parliament; but Mr. Asquith told the House of Commons in Feb., 1906, that a 5s. pension per week to every person over

sixty-five years would cost £26,000,000 a year. He figured the national income at £1,800,000,000, of which landlordism alone took £350,000,000, and railway shareholders £44,000,000. If all workers over sixty years received a weekly pension of 10s., it still would leave the proprietary classes with nearly £900,000,000 income from rent, profits, etc. He pointed out that men in the civil, naval, and military services received high salaries and liberal pensions after a comparatively short time of service. It was, therefore, just and proper that wage earners with incomes of from 14s. to 37s. should be pensioned after a life's work.

The colonies have done better than Great Britain. New Zealand enacted an old-age pension system in Oct., 1898, and gives 7s. per week to every needy and worthy applicant over sixty-five years of age. (See *NEW ZEALAND*.) New South Wales passed a similar act in Dec., 1900, granting 10s. a week at sixty-five or in case of disability. Victoria followed a week later, allowing 7s. to pensioners over sixty-five. In 1903 the expenditure of New South Wales for old-age pensions was: £532,940; that of Victoria, £215,972; of New Zealand, £209,156 = £958,068.

ONEIDA COMMUNITY, THE: This society was founded in 1848 by John H. Noyes at Oneida, Madison County, N. Y., its first members coming mainly from a small community which had existed for several years in Putney, Vt., under Mr. Noyes's leadership. Jan. 1, 1849, there were eighty-seven members, and 306 in 1878. Many of the original members had left the popular orthodox churches because of their acceptance of the higher truths taught, as they believed, by Mr. Noyes, and especially that of the possibility of present salvation from sin. On this doctrine was based the communism of the community, which was perhaps more complete and radical than that of any other communistic society.

Financially the community was not for the first nine years successful, sinking in that time over \$40,000; but thereafter its property increased in value, owing partly to its reducing the number of its branches and concentrating its resources at Oneida, N. Y., and Wallingford, Conn., and partly to its establishing some mechanical industries, which proved more remunerative than farming and gardening, especially that of animal-trap manufacture, under the supervision of one of their members, whose name (Sewell Newhouse) is now stamped on the traps everywhere recognized as of the highest quality.

The members of the community gave much attention to education, and besides supporting good home schools sent many of their young people to college. There was no drunkenness, no tobacco-using, no profanity among the members. All kinds of labor were considered alike honorable and shared alike by all. It was a recognized principle that every one should be esteemed according to his real character, and to this end their system of "mutual criticism" was a great aid. This consisted in plain truth-telling as to character, acts, and influence—not in the backbiting way often practised in ordinary society, but openly, frankly, face to face—"mutual" because

all were expected to participate in it both as critics and subjects. It was regarded as an indispensable means of improvement and of good order and government in the community.

The community published a paper setting forth its principles and life from the year of its founding, 1848, till the year of its change to a joint-stock company thirty-two years later; many handbooks and pamphlets, and a few larger works, including "Home-Talks" by J. H. Noyes, and his "History of American Socialisms." The compendium of their religious doctrines, "The Berean," was published at Putney, Vt.

Mr. Noyes was practically leader of the community during its entire career; but there were department managers, committees, and a business board which met weekly, in which every member was free to participate; matters of special importance were referred for discussion and final action to the family meeting, which was held every evening of the week in their large assembly hall, where every one had a voice and vote.

Socially the members were united by a system of complex marriage, as they termed it, and which they claimed as greatly superior to monogamy. Their critics thought otherwise, and sharply censured their social arrangements. Mr. Noyes in defending them said:

Marriage is permanent union; licentiousness deals in temporary flirtations. In marriage, communism of property goes with communism of persons. In licentiousness love is paid for as hired labor. Marriage makes a man responsible for the consequences of his acts of love to a woman. In licentiousness a man imposes on a woman the heavy burdens of maternity, ruining both her reputation and her health, and then goes his way without responsibility. Marriage provides for the maintenance and education of children. Licentiousness ignores children as nuisances, and leaves them to chance. *Now in respect to every one of these points of difference between marriage and licentiousness we stand with marriage.* Freedom with us does not mean freedom to love to-day and leave to-morrow. . . . Our communities are families as distinctly bounded and separated from promiscuous society as ordinary households. The tie that binds us together is as permanent and sacred, to say the least, as that of marriage, for it is our religion. We receive no members (except by deception or mistake) who do not give heart and hand to the family interest for life and forever. Communism of property extends just as far as freedom of love. Every man's care and every man's dollar of the common property is pledged for the maintenance and protection of the women and the education of the children of the community. . . . Whoever will take the trouble to follow our track from the beginning will find no forsaken women or children by the way. In this respect we claim to be in advance of marriage and common civilization. . . . We are not "free lovers" in any sense that makes love less binding or responsible than it is in marriage.

The community won the esteem of its neighbors, and a reputation for perfect integrity in all matters of business, and for many years was a popular resort during the summer months for excursionists, as many as 1,500 visitors having been on its grounds in a single day. It was never popular with the churches because of its radical religious and social doctrines; and from 1873 there was concerted action against it by the Presbyterian and other religious bodies in central New York, which culminated in 1879 in a conference at Syracuse mainly composed of ministers of different denominations called for the purpose of devising measures for its suppression. This was a difficult task, as the communists had always been peaceable subjects of civil authority, and claimed that their practices were not in violation of any state law. However, the ministers were saved the trouble and expense of legal proceedings, as Mr. Noyes on the 20th of August following the Syracuse Conference proposed to the community that the practice of complex marriage

be given up, "not as renouncing belief in the principles and prospective finality of that institution, but in deference to the public sentiment which is evidently rising against it"; and after his proposition was immediately accepted, thus removing all cause of complaint on the part of any portion of the general public against the community. Since then (1879) ordinary monogamous marriage has prevailed in the community, and since Nov., 1880, it has been a joint-stock corporation, each one's interest being represented by the shares of stock held by him. The organization, however, still retains many features of the former society, such as common grounds, common library and reading-room, common assembly-room, laundry, dining-room, etc.

The corporation, the Oneida Community, Limited, is now managed by a board of eleven directors. Its various businesses—the manufacture of sewing and embroidery silk, silver-plated ware, canned goods, animal traps and chains—have been largely increased, and now give employment to many hundreds of people. The principal office of the company, its large unitary dwellings, and its canning works, are located in Kenwood, Madison County; its silk-works and hardware factories in Vernon, Oneida County; its silver-plating works in Niagara Falls, Niagara County, N. Y., and it has also a hardware factory in Niagara Falls, Canada. It has offices in New York, Chicago, San Francisco, and other large cities. Beginning a quarter of a century ago with a capitalization of \$600,000, it has added \$200,000 to its stock, accumulated a surplus, and paid dividends averaging between 6 and 7 per cent per annum on its stock. The prosperity and harmonious working of the new organization augur well for its perpetuity. WM. A. HINDS.

OPEN OR CLOSED SHOP, THE: In this article an attempt is made to present in a concise form the arguments most commonly advanced by trade-unionists in justification of their demands for the closed or unionized shop, and, on the other hand, the reasons given by the advocates of the open shop why these demands should not be complied with. We have not stated our own views, but give a compilation of the views of others.

THE CLOSED SHOP

"The philosophy of the closed shop is based upon the belief that the welfare of the laboring classes is bound up with the device of collective bargaining, that the success of the expedient depends upon its universal application, and that no individual workman can be conceded rights that are inconsistent with the welfare of his class."

Advantages of Trade-unionism.—Without attempting a thorough discussion of this subject, we present the following summary of the advantages of the trade-unions as cited in recent discussions of the closed shop:

The labor movement implies an orderly effort, not only to wrest concessions from the employer,

but also to secure recognition from society. It is a movement which seeks to change the present standards by which the laborer's share in production is decided, and disputes the right of the employer alone to determine what fair treatment should be. It aims at industrial democracy and is in harmony with the world-wide tendency of the times.

The great consideration is to permit workmen to have a voice in the shop—to have some control over the conditions of employment.

The trade-unions have achieved the gradual and steady increase of wages and the shortening of the working-day.

Trade-unions are coming to be recognized by employers as a permanent part of the industrial offer. In many trades in Great Britain the employers prefer to make terms with the trade-unions which shall apply to non-union workmen as well, rather than to make terms with each class separately. It is coming to be recognized as good policy to deal with the same form of organization and more and more to make that organization responsible, so far as may be, for meeting the obligations that are assumed by it for the workers in the trade it represents.

A well-organized union enables an employer easily to obtain efficient workmen; to make collective contracts, which are more satisfactory, cover a longer term, and are more readily fulfilled than individual contracts; and it tends toward conservatism, and thus lessens the liability of strikes.

To seek to destroy unions because of their defects would be like attempting to abolish government because of its abuses. The unions with all their faults represent a forward stride of the human race. They cultivate a spirit of self-reliance and mutual assistance which ought to more than compensate for their faults.

As the unions become stronger and gain in experience, they tend to conservatism. The hard and stern conditions confronting them can be relied upon to keep them within bounds.

Union and Non-union Employees.—The reasons why union men refuse to work in the same shop with non-union men, and which are at the root of the contention for the closed shop, may be summarized as follows:

A shop with union and non-union men is like a house divided against itself. There is a constant attempt to organize it entirely; an incessant struggle to disorganize it completely.

While accepting the union scale of wages when work is plentiful, the non-unionist will immediately lower wages as soon as work becomes more difficult to obtain.

It is easy to speak of the open shop in which the employer does not care whether his men are union men or not. But the union cannot accomplish its most important object unless the employer deals with it as a union. The employer cannot be made to enter into a collective bargain—and without the collective bargain the conditions of labor are hardly fixed by bargaining at all—unless the union comprizes practically all the men he wishes to employ.

Non-union Workers.—Much attention is given in the arguments of trade-unionists to the character of the men who do not join the unions, with the view of showing that much sympathy is misplaced when bestowed upon these workers who, as alleged, are deprived of their liberty to contract for employment.

Some refuse to join because of intolerable conditions existing in a union. It is maintained, however, that when such conditions exist, the abuses should be prevented by action within rather than without or against the organization.

Another reason given for not joining unions is because of strong but mistaken ideals of persons who believe in individual action, in the right of every man to do as he will, no matter how it may affect his neighbor. This policy, it is maintained, is not practicable in a civilized community.

Another class of non-union workers, it is maintained, consists of persons who, purely through selfish motives, seek to share all the advantages secured by the sacrifices of the trade-unionists without bearing any of the burdens or incurring any of the risks.

Lastly, there is said to be a class of professional strike-breakers. These, it is claimed, are either dishonorably discharged unionists or they belong to the class of criminals, idlers, and incompetents who are only willing to work or to make a pretense of working in order to defeat the ends of honest workmen.

The Legal Right.—It is contended by trade-unionists that in their action for securing the closed shop they are doing nothing but what is lawful.

As free citizens the wage-earners have the right to work or to refuse to work, to make certain demands for their welfare, and to strike if the demands are not granted. An employee has the right to say that he will sell his labor on condition that he is not to work with obnoxious persons. In like manner, laborers can combine to sell their labor collectively and on the same terms. They do not deny the right of employment to non-unionists, but simply refuse to work with them.

The union workmen who refuse to work with non-unionists do not say in so many words that the employer shall not engage non-union workmen. The dictum of the trade-union is not equivalent to an act of Congress or of a state legislature prohibiting employers from engaging non-union men. What the unionists in such cases do is merely to stipulate as a condition that they shall not be obliged to work with men who, as non-unionists, are obnoxious, just as they shall not be obliged to work in a dangerous or unsanitary factory, for unduly long hours, or at insufficient wages.

The Moral Right.—The trade-unionists claim that they are not only legally but also morally justified in refusing to work with non-union men.

Society makes right that which will accomplish the most good for its members as a body.

If it is wrong to ostracize or to refuse to associate with craftsmen who are indifferent to their common welfare, then it is equally wrong, for professional men to shun others of their calling accused of unprofessional conduct, and it is wrong for merchants to taboo other tradesmen who disregard the ethics of their business.

In modern industry working men do not act as individuals contracting with employers. The workingman of to-day belongs to a group, and, whether he will or not, acts with his group and is treated like others of his group. He works the time worked by the others, receives the wages paid the others of his class, and obeys the regulations made for his group. His employer does not know that he exists, but simply knows that so

many hundreds or so many thousands of men of his type are employed at a given wage, for a given number of hours, and under certain given conditions. What affects one of his class affects all.

Just as the individual owes a duty to society, so also, tho in a less degree, he owes a duty to his class. The non-unionist has no moral right to seek his own temporary advantage at the expense of the permanent interests of all working men.

If the union has a right to exist, which is no longer denied, it has a right to insist on those conditions which are necessary to its existence; and it cannot exist if non-union men are permitted to take the jobs of union men.

THE OPEN SHOP

The arguments in favor of the open shop are based upon the necessity of preserving the freedom of individual contracts.

Right of Individual Contract.—In a recent decision of the Superior Court of Cook County, Illinois, it was held that agreements for the closed shop "would, if executed, tend to create a monopoly in favor of the members of the different unions, to the exclusion of workmen not members of such unions, and are, in this respect, unlawful."

The law of morality and the law of man forbid any citizen, whether he be laborer or capitalist, to enforce his demands by the oppression of others, by a denial to any man of his right to work for whom he will, and for what he will, of his right to hire any man for what that man is willing to accept.

The freedom of action is legally and, it is probable, economically a matter of as much concern to society as the freedom of the unionist to combine for proper purposes.

Unless we are prepared to relegate all the laborers in a trade to a condition or status determined by a combination or association known as a trade-union, and to deny the advisability of permitting a worker to choose freely between an individual or a collective contract, we must insist that the compulsory unionization of industry is economically indefensible.

The conditions under which a man shall dispose of his labor are of such exceeding importance to society that, if freedom is to be denied, the restrictions imposed should be determined by the government and not by any other agency. Such regulations should be just, uniform, and certain; they should not be subject to the possible caprice, selfishness, or special exigencies of a labor organization. When it is necessary to restrict the freedom of labor or capital to enter any industry, the matter becomes the subject of public concern and public regulation. If membership in a labor organization is to be a condition precedent to the right of securing employment, it will be necessary for the government to control the constitution, policy, and management of such associations so far as may be requisite for the purpose in view.

Trade-unions have no right to usurp the sovereignty of the State and to destroy that individual freedom which is the cardinal principle of American life, whether it be religious, political, or industrial.

If unions are to render permanent service to the laborers, they must be voluntary organizations. If any device can be invented by employers of laborers by which laborers can be coerced into joining or kept from joining labor-

unions, then these organizations no longer represent either the best thought or the best interests of the laborers. They must necessarily soon degenerate into mere dictatorial groups. There is no principle of ethics, economics, or equity that will make the coercion of laborers by laborers any better than the coercion of laborers by capitalists.

Men who, as victims of trade-union despotism, are forced into the union, would prove elements of weakness and prepare the way for disintegration.

Danger of Trade-union Power.—An important argument against acceding to the demands of trade-unionists for the closed shop is the danger involved in granting too much power to the labor organizations.

It is contended that it would be highly dangerous to allow a permanent and all-inclusive organization of laborers to control such matters as admission to a trade, the introduction of improved machinery, and the rate of wages; that it is highly desirable that a trade-union should always be kept upon its good behavior by the knowledge that an unreasonable or selfish policy will drive both employers and the public to seek relief by appealing to the non-union man.

Injury to Business.—It is claimed that the open shop is necessary in order to preserve the liberty and protect the rights of employers. The closed shop means that none but union men shall be employed; that the foreman shall be acceptable to the union and, therefore, presumably a member of it; that the rules of the workshop shall be made by the unions; and it is claimed that all this practically takes the management of the business out of the hands of the employers and places it with those who lack business responsibility. The men who have put their capital into the business can no longer control their own property, but are practically compelled to turn it over to the management of an organization which deems its own interests in conflict with those of the capitalists.

The closed shop would, it is claimed, be injurious to business and thus disastrous to the general welfare of society;

By imposing on a shop where there is no dissatisfaction, the liability of a sympathetic strike, or of a strike growing out of a quarrel with some other union;

By taking the management out of the hands of the employers who have the greatest stake in the business, and thus inviting failure;

By destroying all competition between good and poor workmen, and thus lowering the standard of skill and resulting in an inferior product;

By destroying all competition between union and non-union men and enabling the unions to force wages up to a point which the business could not stand; and, with a higher price for a poorer product, a closed shop could not compete with establishments not so handicapped. (See UNIONIST and NON-UNIONIST.)

GUSTAVUS A. WEBER.

OPIUM TRAFFIC, THE: Opium was known to the ancients as a stimulant. Theophrastus, Dioskorides, and Pliny describe its culture and properties. It is alleged even that it was known in Homer's time. Sanskrit has no term for it, altho other Oriental languages contain names derived from the Greek. The Arabs introduced opium into Europe and East India in the sixteenth century. Persia is said to have used it first as an intoxicant. China used it for this purpose about 1650. The East India Company monopolized its production and traffic. The Chinese Government prohibited the importation of opium in 1820; it was, however, extensively smuggled into China. This led to the Opium War between China and England which ended 1842, and to the Treaty of Tientsin (1858) in which England forced China to admit opium. In 1876 some new regulations were made. About 1850 opium began to be used in England and the United States as an intoxicant, and opium-dens exist in nearly all large cities of these countries. Lately a campaign against its use has been carried on, particularly in England. The Chinese Government, too, has taken energetic measures to exclude foreign opium and to suppress its production within China (Nov., 1906). There are supposed to be 60,000,000 regular opium smokers and eaters who consume the larger proportion of the output; but one half of the total population is said to be more or less addicted to its use.

Statistics.—China's crop of poppy is estimated at 20,000 to 30,000 boxes per annum (since 1853); East India produced (1873-74) 6,358,495 kilograms of opium, 6,144,132 of which were imported into China. Asia Minor produces 300,000 kilograms annually. India's revenue from opium was, in 1900-1, \$24,633,280; in 1901-2, \$20,804,800; in 1905-6, \$26,344,240; and in 1906-7, \$23,189,120. That of China on native opium, 1900-1, \$1,595,780; 1905-6, \$576,000, and on imported, \$3,600,000. In 1880 the opium revenue of India represented 14 per cent of the aggregate; in 1906 only 7 per cent.

These figures prove that England has been the greatest sinner in regard to the opium traffic. The Chinese Government has made protests against its importation, because they have recognized its pernicious effects upon Chinese subjects. The Turks look upon an opium-eater or smoker with contempt. These attitudes show that the Orientals know how baneful the use of opium is, both on the physique, mind, and morals. There has, however, always existed an influential party in England protesting against this traffic by the Indian Government, and the agitation is beginning to bear fruit, as the decrease in the revenue shows.

OSTROGORSKI, MOYSEY YAKOVLEVICH: Russian member of the Duma; born in 1852; a Jew; representative (Constitutional Democrat) from Grodno Province to the first Duma; graduate of the Law School of St. Petersburg University, he was for a time student of the Paris School of Philosophy and Political Science, and

served in the Legislative Department of the Ministry of Justice. He is the author of several judicial works.

OVERBERGH, CYRIL VON: Belgian economist; born in Brussels, 1866, he studied at the Catholic University of Louvain, in Germany, Austria, Switzerland, and England. Was made commissioner to the king in the precinct of Courtroi and professor of sociology at Louvain; chief of cabinet of Ministry of Justice in Brussels 1893; chief of Cabinet of Ministry of the Interior and Public Instruction in 1895; general director of superior learning of science and letters in 1900. Founded in 1901 the Society of Sociology in Belgium and became its permanent president. Is president of the Belgium Society of Social Economy at Brussels and numerous other scientific societies. Author of "La réforme de la bienfaisance" (1900); "Les courants sociologique du XIX siècle" (1900); "Le Materialism historique de Karl Marx" (1903); "La classe sociale" (1904). Address: 102 Chaussées de Vleurgat, Brussels.

OVERCROWDING: We consider in this article the facts as to the overcrowding of large cities. (For the methods of dealing with the problem, see GARDEN CITIES; HOUSING; MODEL VILLAGES.)

The problem of overcrowding is not identical with that of the tenement question (see TENEMENTS), for there may be serious overcrowding where there are no tenements (large buildings crowded with families of the poorer classes). London has few large tenements yet most serious overcrowding; Chicago, compared with New York, has been said to have no tenement-house problem, yet the Chicago City Homes Association in the winter of 1900-1 found some areas very densely crowded. One seventh of one acre had a ratio of 900 to the acre. Double-deckers were on the increase, and there were then almost 100 within a limited field of investigation.

The overcrowding in New York is, however, probably the most serious in the world, because New York City has both overcrowding and the tenement evil, too, and both in the worst forms. (See TENEMENTS.) Certain portions of New York City are the most densely populated spots in the world. The following table from the census for 1900 gives the general situation in the more crowded cities of the United States.

The census says:

The city of New York as now constituted has, according to the census of 1900, 249,991 dwelling-places, containing an aggregate population of 3,437,202. Of the whole number of dwelling-places in the city in 1900, 95,433, or 38.2 per cent, contain from 2 to 6 persons; 60,672, or 24.2 per cent, contain from 7 to 10 persons, and 89,654, or 35.9 per cent, contain 11 persons or more, leaving 4,332, or 1.7 per cent, for dwellings containing only 1 person. In Manhattan and Bronx boroughs—equivalent to New York City as it existed in 1890—more than one half of all the dwellings contain 11 persons or more, while in Brooklyn borough—equivalent to Brooklyn city in 1890—this number of persons is contained in more than three tenths of all the dwellings in that borough in 1900. These proportions for New York City as now constituted can be compared with similar proportions for Philadelphia, which has about nine tenths as many dwelling-places housing less than two fifths the amount of population, and with Chicago, where nearly four fifths as many dwelling-places house about one half as much population. In Philadelphia by far the largest proportion of the dwellings—72.8 per cent—contain from 2 to 6 persons each, as compared with 21.4 per cent for those with from 7 to 10 persons, and only 4.2 per cent for those with 11 or more persons. Of all the dwellings in Chicago in 1900 about one fourth—25.8 per cent—contain 11 persons or more, 44.1 per

¹ New York City in 1890.² Brooklyn city in 1890.

cent from 2 to 6 persons, and 28.6 per cent from 7 to 10 persons. Considered with respect to population, the differences are even more significant. New York City has very nearly three fourths of its population in 1900 living in dwellings containing 11 or more persons, as against not much more than one half for Chicago and not much more than one eighth for Philadelphia. The proportion of the population—86.1 per cent—contained in dwellings with 11 or more persons in Manhattan and Bronx boroughs, is very much larger than in Brooklyn borough, where it is 60 per cent, or in the remainder of the greater city, where it is between 20 and 26 per cent. Boston has very nearly one half of its population contained in dwellings with 11 or more persons, but in Fall River and Worcester, in the same state, the proportions are even larger, this class of dwellings containing 67.1 per cent of the population of Fall River and 54.8 per cent of that of Worcester. One half of the population of Jersey City is contained in dwellings with 11 persons or more, and the proportions in Cincinnati and Newark—44.4 and 44.3 per cent respectively—are very nearly as large.

New York City has considerably more than one half of its population in dwellings containing over 20 persons, and Manhattan and Bronx boroughs have very nearly three fourths of their entire population in such dwellings.

More than three tenths of the population of Brooklyn borough and of Fall River and one fourth of the population of Jersey City are also contained in dwellings with more than 20 occupants.

Yet this does not adequately present the situation because it gives no information as to the size of the dwellings. This, however, has been done for New York City by the investigations of the New York Federation of Churches (q. v.), using also census returns. It gives the following results for the various boroughs:

| | Acres | Population | Density per acre |
|-----------|---------|------------|------------------|
| Manhattan | 24,110 | 2,112,380 | 149 |
| Bronx | 20,017 | 271,630 | 10 |
| Brooklyn | 49,608 | 1,358,686 | 28 |
| Queens | 82,883 | 198,240 | 2 |
| Richmond | 36,600 | 78,840 | 2 |
| | 209,218 | 4,013,781 | 19 |

This is for the whole city, including the portions not yet built up. For certain districts, however, the *Bulletin* of the Federation for April, 1906, gives the following table:

The following are the populations, in 1905 and 1900, of the assembly districts of Manhattan Island, with their gains of population, and their comparative density in 1905 and in 1900:

| ASSEMBLY DISTRICT | Population | | Five years' gain | Population per acre | |
|--|------------|---------|------------------|---------------------|-------|
| | 1900 | 1905 | | 1900 | 1905 |
| East Side, south of Fourteenth Street: | | | | | |

¹ Loss.

The increase south of Fourteenth Street since 1900 has been 80,327 persons, a larger increase than in any other section of Manhattan or Bronx.

In 1895 there were 417,476 persons south of Fourteenth Street. There has, therefore, been an increase of 69,886 in each of the five decades since that time, but the increase in the last five years alone has been 80,327 persons.

If the remainder of New York were peopled as densely as the lower East Side of Manhattan it could contain the whole population of the United States, continental and insular, as in 1900, plus almost the whole population of Canada.

Certain blocks, however, have a much higher density than this. According to an article by Mr. Finley in the Federation's *Bulletin* (No. 4, 1906), there are fifty-one blocks in Manhattan with populations of over 3,000 inhabitants each. One block on the West Side has a population of 6,173, and a density of 1,145 per acre. Several smaller blocks, mainly on the East Side, with smaller populations have still higher densities.

In no other cities in the U. S. does such overcrowding exist. Yet other cities have conditions bad enough. According to an investigation of certain districts of Chicago, made in 1905 (reported in *Charities*, Jan. 6, 1906), and compared with an investigation of the same in 1900, there

Following is the list of twelve blocks with densities of over 1,100 to the acre:

| BLOCK BOUNDARIES | DENSITY | |
|---|---------|-------|
| | 1905 | 1900 |
| Cherry-Jefferson-Monroe-Rutgers..... | 1,458 | 1,000 |
| Cherry-Clinton-Monroe-Jefferson..... | 1,422 | 1,171 |
| Perry-East Houston-Chrystie-Stanton..... | 1,301 | 1,123 |
| Clinton-Stanton-Suffolk-Rivington..... | 1,291 | 818 |
| Rivington-Sheriff-Stanton-Willett..... | 1,273 | 1,144 |
| Cherry-Montgomery-Monroe-Clinton..... | 1,218 | 703 |
| Rivington-Willett-Stanton-Pitt..... | 1,203 | 1,190 |
| Rivington-Columbia-Stanton-Sheriff..... | 1,172 | 772 |
| Rivington-Goerck-Stanton-Lewis..... | 1,163 | 980 |
| West Sixty-first Street-Amsterdam Avenue..... | | |
| West Sixty-second Street-West End Avenue..... | 1,145 | 553 |
| Elizabeth-East Houston-Mott-Prince..... | 1,108 | 1,025 |
| East Second Street-Avenue C-East Third Street-Avenue B..... | 1,004 | 900 |

has been little or no improvement. There were found 87 city lots wholly built over, 144 more lots 90-100 per cent built over. There were 730 rear buildings occupied by 3,545 persons; 983 rooms were "dark, very dark, or dark and gloomy"; 4,845 persons, of whom 2,652 were children, lived in basements or cellars. There were 161 bathtubs for 1,598 houses and 21,612 people. Garbage was uncollected or dumped in the yards.

After Chicago, Boston, Cincinnati, and Jersey City have the most overcrowding, tho in proportion to their size, Hoboken, N. J., and Fall River and Holyoke, Mass., have worse conditions. The following table from the census gives the general situation:

| CITY | Population | Dwell-ings | Fami-lies | Average number of persons to a dwelling |
|-----------------------------------|------------|------------|-----------|---|
| Baltimore, Md..... | 508,957 | 89,442 | 105,584 | 5.7 |
| Boston, Mass..... | 560,892 | 66,482 | 117,244 | 5.4 |
| Buffalo, N. Y..... | 352,387 | 49,214 | 73,631 | 7.1 |
| Chicago, Ill..... | 1,098,575 | 193,895 | 359,960 | 8.8 |
| Cincinnati, Ohio..... | 325,902 | 40,634 | 74,536 | 8.0 |
| Cleveland, Ohio..... | 381,768 | 63,205 | 81,519 | 6.0 |
| Columbus, Ohio..... | 125,560 | 24,219 | 27,582 | 5.2 |
| Denver, Col..... | 133,859 | 27,100 | 30,936 | 4.9 |
| Detroit, Mich..... | 285,704 | 52,046 | 60,505 | 5.5 |
| Fall River, Mass..... | 104,863 | 9,509 | 21,027 | 11.0 |
| Hartford, Conn..... | 79,850 | 9,699 | 17,231 | 8.2 |
| Hoboken, N. J..... | 59,364 | 4,188 | 13,431 | 14.2 |
| Holyoke, Mass..... | 45,712 | 4,211 | 8,936 | 10.9 |
| Jersey City, N. J..... | 206,433 | 23,627 | 44,760 | 8.7 |
| Kansas City, Mo..... | 163,752 | 28,027 | 36,496 | 5.8 |
| Louisville, Ky..... | 204,731 | 34,055 | 44,912 | 5.9 |
| Milwaukee, Wis..... | 285,315 | 45,809 | 59,806 | 6.2 |

| Newark, N. J..... | 246,070 | 30,397 | 54,054 | 8.1 |
| New Orleans, La..... | 287,104 | 52,988 | 61,775 | 5.4 |
| New York, N. Y..... | 3,437,302 | 249,991 | 735,621 | 13.7 |
| Manhattan and Bronx boroughs..... | 2,050,600 | 100,547 | 433,953 | 20.4 |
| Brooklyn borough..... | 1,166,582 | 113,972 | 255,821 | 10.2 |
| Queens borough..... | 152,999 | 24,221 | 32,121 | 6.3 |
| Richmond borough..... | 67,021 | 11,251 | 13,796 | 6.0 |
| Omaha, Neb..... | 102,555 | 18,027 | 20,723 | 5.7 |
| Philadelphia, Pa..... | 1,293,697 | 241,589 | 265,880 | 3.4 |
| Pittsburg, Pa..... | 321,616 | 50,104 | 63,959 | 6.3 |
| St. Louis, Mo..... | 575,238 | 82,260 | 123,719 | 7.0 |
| St. Paul, Minn..... | 163,065 | 24,681 | 30,919 | 6.6 |
| San Francisco, Cal..... | 342,782 | 53,393 | 71,997 | 6.4 |
| Washington, D. C..... | 278,718 | 49,385 | 56,678 | 5.6 |

The totals for the 160 cities of continental U. S. having at least 25,000 inhabitants are as follows: Total population, 19,718,312; total dwellings, 2,884,621; total families, 4,217,644; private families—number 4,137,279, population 18,632,457; families not private, 80,365. Average number of persons to a dwelling, 6.8; family, 4.7; private family, 4.5.

EUROPE

For Great Britain, see special article, HOUSING IN GREAT BRITAIN.

In Germany, overcrowding has long been a pressing question. (See HOUSING.) In 1891 Berlin had 367,000 families in 21,600 buildings, or an average of 17 families under one roof, not one family in 600 having a house of their own. The cellar dwellings in Germany ranged from 64 per cent of the population in Hamburg to 74 in Berlin. In Breslau, Dresden, and Magdeburg, nearly half the population lived in dwellings with only one room and a small half room or closet, without ventilation or light. Since then, and especially recently, considerable effort has been made to relieve the situation. Yet a report on the conditions in Prussia in 1900 found that in many towns from 10 to 20 per cent of the dwellings, with either no heatable room or only one, lodged on an average 6 or more persons, the average at Halle being 20.20 per cent, Barmen 22.35, and Posen (the highest) 24.07. German cities are, moreover, growing in population, so that the demand for houses is great and rents high. A dwelling with one heatable room in Berlin rents for \$58 per year, and even one in a cellar for \$49; on the fifth or higher stories or attics for over \$48. Even in small towns, like Mayence, one room rents for \$32.50 per year. In Germany, too, as in Great Britain, there is great scarcity of proper housing in even the rural districts, resulting in overcrowding, promiscuity, and other evils.

Undoubtedly the most important recent contribution to international comparisons in overcrowding is Dr. Arthur Shadwell's "Industrial Efficiency" (1906), vol. ii., chap. xi. He gives the following interesting table:

AVERAGE NUMBER OF PERSONS TO A HOUSE

| | | |
|---------------------|--------------------|---------------------|
| London..... 7.2 | Berlin..... 46.6 | New York.... 13.7 |
| Manchester..... 4.9 | Breslau..... 39.1 | Chicago..... 8.8 |
| Birmingham.... 4.8 | Leipzig..... 37.0 | Philadelphia. 5.4 |
| Leeds..... 4.5 | Dresden..... 27.5 | Boston..... 4.4 |
| Sheffield..... 4.8 | Hanover..... 20.1 | Pittsburg..... 6.3 |
| Bradford..... 4.3 | Dusseldorf... 19.4 | Providence... 7.0 |
| Bolton..... 4.6 | Cheernitz.... 22.1 | Fall River.... 11.0 |
| Oldham..... 4.5 | Elberfeld.... 18.7 | Lowell..... 6.9 |
| Halifax..... 4.2 | Barmen..... 18.0 | Lawrence.... 7.7 |
| Wolverhampton 4.8 | Essen..... 18.6 | New Bedford. 7.1 |

But obviously these figures imply different kinds of houses. John Burns, before the National Housing Congress of 1907, spoke of New York as where people live in tenements; Berlin, where people live in barracks; and London, where they live in houses.

When it comes, however, to the number of persons to a room, Germany still shows very much the worst general conditions, tho a few places in the U. S. are much worse. Two persons to a room has been the official standard adopted in England, and anything beyond this is called "overcrowding." Dr. Shadwell finds in England in 1901 only 8.2 per cent of the people overcrowded by this standard; 5.8 per cent in rural and 8.9 per cent in urban districts. In the U. S. the U. S. Bureau of Labor (see above) reports for 1903 a general average for the U. S. of 1.04 room per individual. In Germany the *Reichs-Arbeitsblatt* (March, 1905) reported for 908 households an average of 3.03 persons to a room. But Berlin is exceptionally overcrowded, and this was undoubtedly among the poor. Still Dr. Shadwell finds in Germany "a real house famine," while in England and America there is not, save in specially congested localities. Apart from over-

crowding, however, he finds insanitary housing much less common in Germany than in England. Of Germany he says: "The home is rarely neglected; inadequate it may be in size, but it is kept clean and decent, as are the children." Of England he says: "We have a class, diminishing but still pretty large, which turns any quarter that it inhabits into a slum. . . . Our public sanitation is on a higher level than that of any other land, but nowhere have I seen people so dirty in their persons and living in the midst of such voluntary dirt as in this country." Of the U. S. he says: "The older and larger towns have their full share of dirt, darkness, and dilapidation, but I have been struck by the comparative absence of slums in manufacturing towns of medium size."

REFERENCE: See HOUSING.

OVERPRODUCTION is defined by the majority report of the English Commission on the Depression of Trade and Industry as "the production of commodities, or even the existence of a capacity for production, at a time when the demand is not sufficiently brisk to maintain a remunerative price to the producer." The report affirms that "such an overproduction has been one of the prominent features of the course of trade during recent years, and that the depression under which we are now suffering may be partially explained by this fact." The minority report lays still more emphasis upon "systematic overproduction," and says that "the demand for commodities does not increase at the same rate as formerly, and that our capacity for production is consequently in excess of our home and export demand, and could, moreover, be considerably increased, at short notice, by the fuller employment of labor and appliances now partially idle." Similarly says Mr. Carroll D. Wright in his "Report on Industrial Depressions" (Washington, 1886, p. 89): "So far as the factories and the operatives of the countries concerned are to be taken into consideration (England, the United States, France, Belgium, Germany), there does exist a positive and emphatic overproduction, and the overproduction could not exist without the introduction of power machinery at a rate greater than the consuming power of the nations involved and of those dependent upon them demands; in other words, the overproduction of power machinery logically results in the overproduction of goods made with the aid of such machinery, and this represents the condition of those countries dependent largely upon mechanical industries for their prosperity." Mr. Edward Atkinson, in numerous essays, and Mr. David A. Wells, in his "Recent Economic Changes," argues the same way.

In Europe Lord Playfair, writing in 1888, adds for this position the authority of Dr. A. von Studnitz, Piermez, Jules Duckerts, Laveleye, Trasenster, Annecke, and Engel. Mr. Wells finds the asserted excess of production due to three prime causes: First, increased capacity of production; second, improved methods of distribution; third, the opening up of new abundant supplies of raw material. (For details on these points see articles **MACHINERY** and **COMMERCE**.) Mr. Hobson ("The Evolution of Modern Capitalism," p. 173) shows that the rise of productiveness in machinery in England, between 1850 and 1885, may be roughly estimated at 40 per

cent, while Mr. Wright, in the above-mentioned report, shows that in the U. S., between 1866 and 1886, the gain of machinery—taking the aggregate, as measured by "the displacement of muscular labor"—was more than one third, while in some trades the improvement of mechanical productiveness for labor was from 50 to 300 per cent. Commerce has made even greater gains. A ton of wheat can now be hauled by sea at less than a farthing per mile. The opening of the Suez Canal is said to have destroyed a tonnage of two millions. Raw material can be delivered in bulk in England at only a trifle more than the cost of its production in its far-away home. All this has enormously increased the capabilities of production. The amount of overproduction must, as Mr. Hobson has pointed out in his "Evolution of Modern Capitalism," by no means be measured by the amount of goods actually produced for which there are no buyers; this is but a small portion of the evil. A far greater evil is that the factories are often able to produce in a short while far more than there is any hope of selling, and so they stop work. This produces not only a glut upon the market, but shuts down factories, workshops, mines, railway enterprises, etc.

The circle of our production is thus stated by Hobson (*idem*, p. 179): "Improved machinery of manufacture and transport enables larger and larger quantities of raw material to pass more quickly and more cheaply through the several processes of production. Consumers do not, in fact, increase their consumption as quickly and to an equal extent. Hence the outward flow of productive goods is checked in one or more of the manufacturing stages, or in the hands of the merchants or even in the retail shops. This congestion of the channels of production automatically checks production, depriving of all use a large quantity of the machinery and a large quantity of labor. The general fall of money income which has necessarily followed from a fall of prices, uncompensated by a corresponding expansion of sales, induces a shrinkage of consumption. Under deprestat trade, while the markets continue to be glutted with unsold goods, only so much current production is maintained as will correspond to the shrunk consumption of the deprestat community. Before the turn in the commercial tide, current production even falls below the level of current consumption of the glut of goods which had congested the machine. After the congestion which had kept prices low is removed, prices begin to rise, demand is more active at each point of industry, and we see the usual symptoms of reviving trade.

Thus analyzing the cycle, Mr. Hobson argues that the root evil is underconsumption rather than overproduction, a thought which we shall revert to later. Here we notice that English economists have largely denied the possibility of a general condition of overproduction. They have argued that every one who produces creates a corresponding power to consume. Producers may produce the wrong kinds of goods—goods for which there is no market—so that in certain trades or lines of goods there may be a trade overproduction, but the mere fact of production creates with it the ability to consume, so that the total production cannot be more than the total ability to consume. This argument Hobson quotes from Adam Smith, McCulloch, and J. B. Say, but it is a superficial view. Hobson says: "The fallacy involved in the supposition that oversupply is impossible, consists in assuming that the power to consume and the desire to consume necessarily coexist in the same persons." He instances the case of a glut of cotton goods, due to improved cotton machinery. The spinners and manufacturers have the desire to consume; that is, to exchange these goods for commodities; but the ill-clad of Russia, East London, and even Manchester, who desire the cotton goods,

Orthodox
View

have no money nor anything else which the manufacturers want, and so the manufacturers cannot sell to them. But the manufacturers can sell, it is said, to those who perhaps do desire the labor of the ill-clad; so they sell the cotton goods to merchants and buy what they want, while the ill-clad work for those who want their labor, and with their wages buy the cotton goods. Thus a roundabout exchange of goods arises, and Hobson says "this answer is valid on the assumption that the Lancashire producers desire to consume an equivalent of the goods they produce." But let us suppose, Hobson argues, that they do not desire to so consume. Suppose they desire not to consume so much, but to save or invest in more means of production, more mills, more means of transportation, etc. Then we have a production not balanced by an equal amount of consumption, and so there may be an overproduction. It is true that they may desire to produce more in order to consume more eventually, or to have their children consume more; still, temporarily, they do not consume as much as they produce, and so there is a cycle or season of overproduction which may occur in enough trades to be general. Hence Hobson argues that there may be too much saving; that all would be well if men would consume more—consume as much as they produce. Hence he maintains that the real trouble is not overproduction, but underconsumption; that a too sudden development of railroad-building, factory-building, etc., stimulates the market for a while, but leads to a temporary overproduction, which should have been avoided by more immediate consumption and less investment.

Socialists, however, find this analysis of Hobson's but partial. Why do not the ill-clad in Russia and London buy cotton goods? Because they have no money? Why do they not work and earn money? Some of them can find no work; others of them are too shiftless or too undisciplined to be willing to do work which is in demand. But why are they shiftless? Why have they so little energy? Very largely, Socialists say, because of their environment, and still more largely because of their early environment. (See POVERTY, CAUSES OF.) How can good environment be obtained? By self-effort, say some. But this is making the end develop the means. The question is, how to produce self-effort. You must have somewhat of good environment to produce self-effort. By wise charity, say others: model dwellings, penny savings-banks, etc. But charity, even Associated Charity (q. v.), admits by its leaders to-day that it cannot meet the whole problem. It takes the united

Socialist View

action of society to reach the problem. Cities, municipalities, in spite of theorists, are more and more being driven to care for the helpless and the shiftless. But the cities cannot employ the unemployed, it is said, without such taxation as will crush the activities of those who are energetic and have self-help. Then let the municipalities themselves produce; themselves conduct natural monopolies; themselves become producers, in a word; and the municipality can consume (that is, spend) every dollar it produces, by employing men and women in productive work; that is, work that shall produce commodities, healthy homes, parks, art-galleries, etc. These commodities, parks, art-galleries, will not be themselves commercially productive, but be produc-

tive of better life. Thus the shiftless and unemployed (for whatever reason they be unemployed) may be given opportunity or be compelled to work, and thus be able to consume more; a state which will in part, at least, equalize consumption with production. Therefore, even under the wage system, Socialists maintain that more social production can aid distribution and so aid consumption; while, if universal cooperation ever replace the wage system, and the functions of the capitalist and the worker be not divided between two classes, but be united in the same class, then there will be little if any overproduction, and certainly no general overproduction, since when all men shall receive their share of what they produce, and one class shall not receive large profits and another scarcely a livelihood, all will have approximately equal ability to consume, and the wants of humanity can, as a whole, be not limited. It may even then be possible to produce more shoes than humanity can wear, but not for long. Hours can be limited and production so lessened; and at least there will not be the horrors that to-day accompany what is called overproduction, and which so excite the wrath of Socialists—an "overproduction" of shoes, when millions are going shoeless; an overproduction of "corn," when thousands die of starvation; an "overproduction" of commodities which, sometimes, even the very "hands" that have helped make them bitterly long for, but cannot buy. Socialists are never weary of picturing the pianomakers, who have no piano in their homes; the carpet-weavers, who return to bare floors; the garment-workers, who live in all but nakedness. It is little wonder the term "overproduction" seems to them a mockery and a lie. Neither overproduction nor underconsumption is to them the root evil, but unequal distribution.

Mill's *Political Economy*, book iii., chap. xiv.

OVERTIME is the time that employees work beyond the customary or legal hours. The practice of working overtime exists, particularly in England, in almost all trades to some degree, and in some trades is almost universal and carried to a large extent. When firms, as in the engineering, printing, or dressmaking trades, have orders that must be filled speedily, they often seem all but compelled to work their employees overtime. And often employees are glad to do so—though whether wisely or not we shall in a moment consider—first, because they are glad to work more and so earn more, and secondly, because most firms (though not all) pay at higher rates for overtime than for work in ordinary hours. The law, too, usually allows overtime in certain trades for certain reasons, provided that the employees are paid for it. We shall see that even this paid overtime is a questionable advantage and a questionable necessity; but in some trades overtime is the rule and not paid for. In some trades, usually those paying the lowest wages, and usually employing girls, children, or the less intelligent men and women, employees are continually compelled to work overtime without extra payment, on threat of being discharged. Cases are by no means rare where girls and even men are locked in and compelled to work, sometimes late into the night, with no extra pay. Usually the firm

goes through the form of getting the employees to consent; the employees usually consent, knowing that if they do not they will be soon discharged. Sometimes the firms gain the employees' consent by offering a little lunch, or, occasionally, a drink. In the clothes-making trade of all descriptions, and in smaller shops of various trades, overtime is a very great evil. (See EIGHT-HOUR MOVEMENT; also SWEATING SYSTEM.) Even where firms pay employees for overtime and pay well, the better-informed employees usually do not desire it; and sometimes do not

Evils of Overtime

desire it even when, in order to stand well with the boss, they consent. The reason why it is an evil, even when well paid for, is, first, because it very seriously prevents the reduction of the actual working-hours and thus forfeits all the very great advantages of the short-hour movement. (See EIGHT-HOUR MOVEMENT.) Often, and particularly in England, overtime work renders practically nugatory the effect of short-hour legislation. Second, overtime, even when seemingly paid for, is not really paid for, and employees get no more pay than they would if they did not work overtime. This is for the reason that what determines the rate of pay is not the amount done or the hours worked, but the standard of living of the operatives in the given trade. Under competition no firm can long afford to give higher pay than the lowest for which operatives of the requisite ability are willing to work. What this is depends on what it costs the operatives to live. In the long run it is found that few operatives get more than what their standard of life demands (though this, of course, varies very much between skilled and unskilled trades, etc.). Therefore, if employees by working overtime earn more, the firm can, and often under competition must, lower the general rate of wages; and the employee finds himself working overtime and yet earning no more than before. (See WAGES; also PIECE WORK.)

Nor is overtime always so necessary or advantageous to employers as they imagine. Occasionally, in some trades, as those above mentioned, it does seem necessary; but usually even where it seems necessary, if it were absolutely forbidden, customers would learn to think ahead and give their orders in time to have them fulfilled in ordinary hours; the firms would do just as much work, with less friction, with less payment at high rates for overtime, and, above all, with less demoralizing effects on their employees. Sometimes employees who work overtime will slacken work in ordinary times in order to get the higher rate of pay for overtime work. Mr. Rae ("Eight Hours for Work," p. 122) says:

Not Necessary

Mr. Spill, an india-rubber manufacturer, informed the Children's Employment Commission that he found working overtime extremely unprofitable, because his men used to loiter over their work in the regular hours in order to get better pay for it by doing it during overtime.

Mr. Rae says again (idem, p. 98):

The manager of a Massachusetts carpet-mill reports of the lengthening the ten-hours day by running overtime for a season, that the production increased for the first month after the overtime began, but then the men grew listless, the quantity of their output fell off, the quality of the goods deteriorated, and by the third month the books showed that the mill was doing no more in the day, with ten hours and overtime to boot, than it did before in the ten hours alone. The imposition of the strain takes time to tell to the full; the relaxation of the strain does the same.

From instances Mr. Rae concludes (idem, p. 65) that it is

certainly very doubtful whether the world has ever gained anything by systematic overtime, and whether men would not do quite the same amount of work from year's end to year's end if it were abolished altogether. Mr. Bowling, one of the factory inspectors, remarks that he was struck with the frequency with which employers said to him overtime was utterly unprofitable, and nobody can read any of the reports of commissioners on labor or trade questions without being struck with the same circumstance. Incidental overtime may be unavoidable in the engineering trade, but the persistent overtime now habitually wrought might probably be abolished with positive benefit to production.

And yet in the engineering, printing, dress-making, and other similar trades, overtime is the rule.

OWEN, ROBERT: "The father of modern communism," born in Newtown, North Wales, in 1771. At ten years of age he was put to work in a draper's shop, but later removed to Manchester, where, when only nineteen years old, he was manager of a large cotton-mill. In 1800 he purchased, with his partners, the New Lanark Mills on the Clyde, where Arkwright in 1789 had erected one of the earliest cotton-spinning establishments.

He tells, in his autobiography, with what enormous difficulties he had to cope when he purchased the property. Women and children were employed under conditions which debased both mind and morals; drunkenness and ignorance, fifth and immorality, were the characteristics of the population. Owen believed, however, in the omnipotent effect of circumstance in molding character; the notion that individuals form their own character he called "the enemy of humanity, the hydra of human calamity." He therefore set himself to work out reform on this principle.

Drunkenness was discountenanced by the introduction of resorts where the workmen could find both pleasure and profit; immorality was checked by informal lectures setting forth its practical evils, as well as by various ingenious contrivances calculated to appeal to the honor of the operatives; the employment of young children was discontinued; the homes of the people were materially improved; good, honest provisions were supplied at cost price; children's schools were started, and insurance funds against old age and illness were not forgotten.

Owen's first book, "A New View of Society; or, Essays on the Principle of the Formation of the Human Character," the first essay in which was published in 1813, argues that man's character is made by circumstances, and that the one important thing to do, therefore, is to establish a right physical, moral, and social environment.

In 1815 Owen began an agitation for a factory law curtailing the hours of work, prohibiting infant labor, and affording health and education to operatives.

The bill finally became a law in 1819.

Owen's first public step in the path of socialism may be said to have been the famous report which, in 1817, he communicated to a committee of the House of Commons on the poor-laws. In this he pointed out that the only permanent remedy for distress was the united action of men and the subordination of machinery. For the treatment of pauperism he recommended co-operative communities.

"This," says Professor Seligman, "was the

turning-point in his career and the virtual beginning of English socialism."

Every one was to work for the benefit of all; the meals were to be cooked and eaten in common; dormitories in the shape of parallelograms were to be erected, and the details of government regulated in the most minute manner. His plans were supported by many prominent men in England, including his special patron, the Duke of Kent, the father of Queen Victoria. But at this juncture his violent attack on all religions alienated the affections of many influential adherents—and it must be said that he showed a narrow-mindedness as great as that which he ascribed to his opponents. Owen was now a world regenerator, an extremist, a socialistic idealist, whose confident anticipation of a millennium seemed to increase in inverse ratio to the failure of his schemes.

In 1825 he purchased New Harmony of the Rappites (which see), in the United States, at the time of its purchase containing some 30,000 acres, 3,000 of it under cultivation, with nineteen detached farms and a regular village with streets, squares, churches, schools, and other edifices. (See *NEW HARMONY*.) Here Owen soon collected over 900 souls of "all classes and conditions of men," which he endeavored to constitute into a community on the basis of exact equality, and in practise of community of labor and of goods.

To enter into the details of his communities would be impossible. Owen made a triumphal visit to America in 1829, being greeted with universal acclamation, as on the Continent ten years

before. He had almost completed negotiations with the Mexican Government for the grant of an immense tract—when suddenly, with the fall of the liberal government, all the bright prospects again vanished.

After this Owen's interest in cooperation gradually vanished, his energy being henceforth centered on the propagation of his all-embracing socialistic schemes. On returning from America he made London the seat of his activity. Repeated addresses were issued, numerous associations formed, while the most bizarre ideas were proposed, such as the floating cooperative community on the Thames. In 1832 was established the "Labor Exchange System." In 1835 the word socialism first appears in Owen's propaganda. After an unsuccessful attempt to win over the trade-unions, at whose first large congress he presided, Owen became still wilder. In 1850 he called the world a great lunatic asylum, but was still full of confidence; shortly after, he denied the right of property, and became an ardent spiritualist; and in his last year showed the persistence of his convictions by addressing an open letter to the potentates of the earth, and by writing an autobiography full of youthful enthusiasm. He died in his native town, Nov. 19, 1858.

He was author of "Book of the New Moral World," "Revolution in the Mind and Practise of the Human Race," "The Life of Robert Owen, Written by Himself" (London, 1857).

P

PACIFIC RAILWAY DEBTS: In order to aid the building of the Pacific Railway, Congress (see *CREDIT MOBILIER*) loaned the Central Pacific Railway Company, originally, \$64,623,512. Bonds were issued at 6 per cent, maturing in 1895, '96, '97, '98, and '99. By 1895 it was estimated that there was due the government, for principal and interest, about \$125,000,000, fully \$70,000,000 for the Central Pacific, and \$55,000,000 for the Union. The exact figures at any given date cannot be stated with precision on account of the mass of counter-credits for services delayed, disputed, or otherwise in suspense. Some authorities put it at \$138,000,000.

Concerning the transactions of the Pacific Company, the report of the Pacific Railway Commission of 1887 says, in brief:

Congress enacted that the companies should have their stock fully paid in cash. The stock actually paid in amounted to \$1,797,000; the stock paid in "as sworn to" amounted to \$97,098,000. The 2,496 miles of aided roads were built at a cost of \$95,955,000. Stocks and bonds were issued on these to the amount of \$268,302,000, all of which was taken by the men who built and managed the roads. In the accounts of the Central Pacific Company the division of earnings for improper purposes amounted to many millions, through contracts made by Messrs. Stanford, Huntington, Hopkins, and Crocker with themselves. They constructed 2,171 miles of road adjunct lines, at a cost of \$27,217,000. On account of that construction, in addition to the small cash payment, they issued bonds to themselves to the amount of \$33,722,000, and stock to the amount of \$49,005,000. Then as directors of the Central Pacific, they took leases of their own lines for the Central Pacific for \$3,400,000 per annum; which was at the rate of nearly 13 per cent. Fifteen months ago [in 1886] three of these directors [Stanford, Huntington, and Crocker] contracted with themselves to build an extension of 103 miles. In payment they issued stock to the amount of \$8,000,000, and

bonds to the amount of \$4,500,000, the market value of the stock and bonds being at the time, \$8,340,000. The actual cost of construction was \$3,505,000, so that they personally profited by their own votes by that single transaction to the extent of \$4,834,000, etc., etc. Had the Pacific railroads been built and managed upon honest methods, had the government loan been properly applied, these companies, regarded as a whole, could have declared dividends at the rate of 6 per cent per annum for eighteen years, from the date of actual completion to the present time, upon all the moneys that they would have been required to pay in to complete and equip the roads; they would have owned 2,495 miles of roads free from all debt, and worth \$124,700,000, upon an original outlay of less than \$35,490,381.44; three of them, the Union Pacific, Central Pacific, and Central Branch, could have repaid every cent of the principal and interest advanced by the government to date, and could have reduced their charges to shippers to the extent of over \$140,000,000, or nearly \$8,000,000 per year. But they chose dishonest methods. At the outset they divided \$172,347,113 of fictitious capital, they dissipated over \$107,000,000 which should have been applied to the payment of the principal and interest of the government debt, and they taxed shippers to the extent of over \$140,000,000, or nearly \$8,000,000 a year, to pay for the inflation of the capital of these companies, and for the vicious practices that crept into their management.

Of the Union Pacific, writing in *Everybody's*, July, 1907, Mr. Will Payne says:

The government and first-mortgage bonds covered the cost of building the line. The other \$4,400,000 of securities represented profits. Presently Jay Gould took a hand in Union Pacific. He controlled the Kansas Pacific and Denver Pacific, which together had \$35,000,000 of common stock—all water and of little current value. He persuaded the directors of Union Pacific to buy these lines and to exchange Union Pacific stock at par for their bogus shares.

Overloaded Union Pacific went into bankruptcy in 1893, and was reorganized. Holders of the old bonds received in most cases par in new 4 per cent bonds with a bonus of 50 per cent in new preferred stock. There was issued \$75,000,000 of new preferred stock, practically all of which was given in bonuses to the old security holders and to the reorganization syndicate. The \$61,000,000 of old common stock was con-

verted into the same amount of new common. Dividends of 10 per cent a year are now paid on this new common stock. Some part of this is due to Mr. Harriman's brilliant speculations in the stock of other roads. The rest of it is due to a heavy traffic carried at rates higher than would yield a fair return upon the investment. Incidentally, the road received the gift of an empire in public lands. The moiety remaining unsold at the time of the reorganization was valued at \$1,358,500.

The Northern Pacific fared even better in this regard. The government gave it 40,000,000 acres of public lands—a piece of generosity which in no wise restrained the stock-watering proclivities of the builders and reorganizers.

PACKING-HOUSE INVESTIGATION: In 1905, Mr. Upton Sinclair, in a very widely read novel, "The Jungle," described conditions of filth, horror, and immorality, as existing in the Chicago meat packing-houses, sensational to the last degree, and supported them by definite and concrete statements, challenging the packing companies to sue him for libel if they were false. The companies only made general denial; the public became generally alarmed and incensed. President Roosevelt appointed Dr. Charles P. Neill, United States Commissioner of Labor, and Mr. James B. Reynolds to investigate the packing-houses. Upon their doing so, the president sent a special message to Congress with the report. A bill was passed somewhat meeting the situation; the companies undertook some cleaning and improvement, the great evils still exist. The report of the investigation committee is too long to give. We present here in condensed form the notice of it which appeared in the *Outlook* for June 16, 1906:

The report of Messrs. Neill and Reynolds is the result of two weeks and a half spent in the investigation in Chicago. As the president's commissioners say in that report, they make no statement that was not verified by their "personal examination." The statements they make are specific, and altho they mention no names, they state with detail what came under their observation. Filth and unsanitary conditions they found before entering the buildings; the pavements are such as to retain the accumulated refuse; dead animals they saw left lying on the platforms. "The only excuse," they report, "given for the delay in the removal was that so often heard—the expense." Within the buildings the conditions they describe are such that regard for decency makes only a brief summary possible in these columns. Walls, rafters, and supports, and usually the floors, are of wood. In many rooms the floors are "soaked and slimy." Light and ventilation are wretched. Of many of the inside rooms the commissioners say "they may be best described as vaults in which the air rarely changes." Even in outside rooms they found windows so dirty and walls so dingy that the light penetrated only twenty or thirty feet. "Usually the workers," they say, "toil without relief in a humid atmosphere heavy with the odors of rotten wood, decayed meats, stinking offal and entrails." Tables, carts, tubs, and other receptacles they also found in most cases to be of wood, and "frequently found water-soaked, only half cleansed, and with meat scraps and grease accumulations adhering to their sides and collecting dirt." Such sanitary conveniences for the working men and working women as they found were of the vilest. What they say with regard to the arrangement of the toilet facilities within the packing-houses we do not care here to repeat. It is sufficient to say that the facilities are about as bad as can be well imagined. Those who care to

know the facts on this aspect of the subject can find them frankly stated in the report itself. The commissioners affirm that even in the newer buildings the defects of the earlier structures are not remedied. The only model buildings to be found are one office building and two for cooling, storage, and sales purposes.

As revolting as the buildings and their condition were, the commissioners found the way in which the meat products were handled in Chicago to be equally repugnant. The meat that is to be sold in bulk, which is the form in which an overwhelming proportion of the meat is distributed, is handled with regard to cleanliness; but the commissioners report that "the parts that are sent from the cooling-room to those departments of the packing-houses in which various forms of meat products are prepared are handled with no regard whatever for cleanliness." In other words, apart from the indecent and unwholesome surroundings, the offensiveness is to be found principally in the processes of preparing the canned meats. The commissioners describe the workers' aprons as being, as a rule, "indescribably filthy." Against these aprons and even dirtier clothing the commissioners saw the meats constantly pressed. The habits of the workers themselves, accustomed as they are to a most degrading environment, are such as to make the conveyance of tuberculosis and other disease germs most easy. As the meat is shoveled from the floors, piled on tables, and pushed to and fro in box-carts, it is liable to gather dirt and disease. When the commissioners called attention to this fact, "it was always the reply," they report, "that this meat would afterward be cooked," and thus sterilized; but the commissioners add that this is not always the case. The commissioners, in commenting on the present method of inspection, declare, first, that it is most rigorous where it is least needed—namely, at the time of killing. It is while the meat is being handled that it is made loathsome. They found, for instance, stale meat scraps, and even bits of rope in tins with the label "Quality Guaranteed." As a matter of fact, all that has been inspected is the carcass of the animal at the time of killing; and the government, of course, does not guarantee the quality. Inspection, moreover, does not apply to the health and comfort of the laborers. "The various departments," say the commissioners, "are under the direct control of superintendents who claim to use full authority in dealing with the employees and who seem to ignore all considerations except those of the account book." That this fact is not only a menace to the social conditions of the community, but also to the physical well-being of the people of the nation, the commissioners recognize in these words:

The neglect on the part of their employers to recognize or provide for the requirements of cleanliness and decency of the employees must have an influence that cannot be exaggerated in lowering the morals and discouraging cleanliness on the part of the workers employed in the packing-houses. The whole situation as we saw it in these huge establishments tends necessarily and inevitably to the moral degradation of thousands of workers, who are forced to spend their working-hours under conditions that are entirely unnecessary and unpardonable, and which are a constant menace not only to their own health, but to the health of those who use the food products prepared by them.

The packers' reply is presumably the strongest that can be offered in refutation of the specific allegations of the president's agents, for they

would certainly not have failed to deny them with equally specific detail if they could have done so. Their case would have been stronger if they had kept silence.

PAINE, ROBERT TREAT: Philanthropist; born 1835, Boston, Mass.; educated at public schools, Harvard College, Harvard Law School. After two years in Europe he was admitted to the bar in 1859. Retired from the practise in 1872 to devote himself to the benevolent enterprises with which he is identified. He was one of the founders, in 1878, of the Associated Charities of Boston. In 1879 he organized the Wells Memorial Institute to promote the welfare of working men and women. In 1888 he established the Workingmen's Loan Association. He has built more than 200 houses for working men, selling them at moderate price and on easy credits. In 1884 he was unsuccessful Democratic and Independent candidate for Congress. He is president of the American Peace Society, of the Associated Charities of Boston, and other organizations.

Mr. Paine formerly advocated moderate tariff views—but for the last twenty years has been in favor of free raw material and an increasing measure of free trade. He believes that in social reform the great hope lies in the increasing interest which the well-to-do are taking in the welfare of the people; that personal service is the duty, the privilege, and the joy of life. Author of many reports, papers, pamphlets, circulars, and addresses on "Pauperism," "Cooperative Banks," "Homes for the People," "The Inspiration of Charity," "The Spiritual Efficiency of the Church," etc., etc. Address: 6 Joy Street, Boston, Mass.

PAINE, THOMAS: Radical; patriot; signer of the Declaration of Independence; born at Thetford, England, 1737, son of a Quaker stay-maker, he learned his father's trade, but did much private studying. In 1756 he served a short time on a privateer; in 1762 he obtained a post in the revenue service; in 1765 he was discharged for irregular conduct, but was restored the next year. Waiting for a vacancy, he taught school and preached. He published in 1772 "The Case of the Officers of the Excise," which led to his discharge from the excise service in 1774. Invited by Franklin, he went to America, and soon found employment in Philadelphia as editor of the *Pennsylvania Magazine*. He wrote against slavery, and Jan. 10, 1776, published his celebrated "Common Sense," of which 120,000 copies were sold in three months. Dec. 19, 1776, he published in the *Pennsylvania Journal* the first number of "The Crisis," and continued the numbers irregularly through the war, exerting wide influence for independence and republicanism; in 1777 he was chosen secretary of the Committee of Foreign Affairs; was dismissed and censured by Congress in 1779 for revealing secrets. He was soon after elected clerk of the General Assembly of Pennsylvania. He received in 1780 a degree from the University of Pennsylvania, and in 1781 went with Colonel Laurens to France and negotiated a loan, for which Congress gave him \$3,000, and New York an estate, and Pennsylvania \$2,500. In 1787 he went again to France and then to England, where in 1791-92 he published in London his "Rights of Man," a reply to Burke, and defense of the French Revolution. France made him a citizen, and in 1792 he was elected deputy from Calais. He acted

with the Girondists and opposed the execution of the king. He was imprisoned by Robespierre, 1793-94, narrowly escaping the guillotine. In prison he completed his "Age of Reason," and published it when released in 1795. He again took his seat in the Convention and resided two years with James Monroe, United States Minister to France. In 1802 he returned to the U. S. in a U. S. sloop of war and was cordially received at Washington, New York, and Philadelphia. He was, however, opposed by the Federalists and branded by the orthodox as an atheist, tho he was really a free-thinking theist. He lived in comparative obscurity in New York, and died on his estate at New Rochelle in 1809.

PALGRAVE, ROBERT HARRY INGLIS: Economist; born in London in 1827—the third son of Sir Francis Palgrave, K.H., the well-known historian and author. His eldest brother was Francis Turner Palgrave, professor of poetry at Oxford. R. H. Inglis Palgrave was educated at Charterhouse, but early went to Great Yarmouth and entered the banking-house of Gurneys & Co., where his grandfather, Dawson Turner, F.R.S., was a partner. Interested in economics, he won a prize, awarded in 1870 by the Statistical Society of London, for his essay, "Local Taxation of Great Britain and Ireland." In 1877 he became associated with the *Economist*, of which after Mr. Bagehot's death he became editor. In 1882 he was elected Fellow of the Royal Society, and, in 1885, was appointed one of her Majesty's Commission on the Depression of Trade and Industry. He has edited the "Dictionary of Political Economy," Macmillan & Co., and wrote "Bank Rate and the Money Market," John Murray, London. Address: Heastead Hall, Wrentham, Suffolk, England.

PANAMA CANAL, SOCIOLOGICAL EFFECT OF: For 400 years men have dreamed of cutting this ditch, thus saving a third of the distance in circumnavigating the globe. In 1551 the Spanish historian, Gomara, urged on Philip II. the importance of cutting the isthmus.

Dr. Josiah Strong has pointed out the result on civilization of the opening of the canal now by the United States and of its *not* being opened before. History would have been very different had Columbus been able to realize his vision and, sailing through a canal, put Europe in immediate communication with the Far East. It would also have been very different had the canal been built before under Spanish or French influence and put Latin civilization in control of its immense possibilities. Completed now it will be under very different auspices.

To-day the eastern U. S. are about as far from the Pacific ports by water as is western Europe. With the canal they will be nearly 3,000 miles nearer. In other words, commercially speaking, the Pacific will be brought nearer New York by a distance equal to its entire width. The central and southern U. S. will be aided still more. The Mississippi will almost empty into the Pacific. It will be possible to steam from Pittsburg to Hongkong and from Nebraska to Australia, perhaps from Chicago and Duluth to Shanghai and Manila. The Mississippi Valley, with its 1,244,000 sq. m., its 5,000 miles of waterway navigable by steam, its inexhaustible fertility and great variety of product; the South, with its cotton, its inexhaustible mines of the finest coal in Alabama, its pig iron in Alabama and Tennessee—

all this will have a new gateway and that into the new Mediterranean of the world.

The Pacific is surrounded by peoples now numbering 500,000,000, one third of the human race, and if we include India, to which the commerce of the Pacific has easy access, the numbers rise to 800,000,000, or one half the human race. Here, too, is the great room for growth. All of the great undeveloped habitable portions of the earth, except Africa, are ranged around the Pacific—Alaska, British America, our great West, Central and South America, Australia, some of the larger East Indies, and Siberia. To the U. S., already the greatest manufacturing and producing country of the world, the canal will give a great natural advantage over Europe.

republican, but recognized on her return to Manchester that woman's inferior position would never be improved by the present political parties. She married Dr. Pankhurst in 1879, who had been a member of the first Women's Suffrage Society, founded by J. S. Mill. Mrs. Pankhurst became a member of the executive committee of that society, and assisted her husband in two campaigns for Parliament. She removed to London in 1886, where she joined the Independent Labor Party. On her return to Manchester she served as guardian at the polls from 1893-98; was appointed Registrar of Births and Deaths in 1899 after her husband's death. In 1900 she was elected to the School Board, and formed the Women's Social and Political Union, as a branch

¹ Via Honolulu, add 252 miles. ² Omitting Tahiti reduces voyage from Brito by 52 miles. ³ Voyage from Brito to Sydney by way of Wellington is 232 miles less than by way of Tahiti; from Panama it is 405 miles less. ⁴ Voyage from Brito to Wellington direct is 185 miles shorter than via Tahiti, and from Panama it is 358 miles shorter.

PANKHURST, CHRISTABEL: Woman suffragist and lawyer; born 1880 in Manchester, England; was educated at home, later at high school in her native city, and Switzerland. When her father died, she became interested in all movements in which her mother took part, as a member of the Independent Labor Party, Woman Suffrage, Women's Trade-Union, and was refused admission as a student to Lincoln's Inn. In 1905 she won a prize for international law at Victoria University, Owen's College, Manchester; took her degree in law in 1906, at the head of her class. She was imprisoned for one week for interrupting Sir Edward Grey's meeting in Manchester, Oct. 13, 1905. She is the chief organizer for the Women's Social and Political Union, and is a popular speaker on that platform. Address: 4 Clement's Inn, Strand, W. C., London, England.

PANKHURST, EMMELINE GOULDEN: Woman suffragist and emancipator; born in Manchester, England; attended the Ecole Normale for girls, in Paris, and was roommate of Henri Rochefort's daughter. She became an ardent

of the Labor movement. Address: 60, Upper Brook Street, Manchester.

PANTALEONI, MAFFEO: Born in Frascati in 1857, and now, professor of political economy in the University of Rome, is in the first rank of writers on taxation and other financial themes. Achille Loria ("Annals of the American Academy of Political and Social Science," vol. ii., p. 216) says that his "La Teoria della Traslazione dei Tributi" investigates the reactions of taxes "with a marvelous acuteness, not equaled in the pages of any other Italian writer." In 1889 he published "Principii de Economia Pura," which has been translated into English. His theory of value conforms in general to that of Jevons, but he has criticized alike the English and the Austrian school.

PAPER MONEY: Money (*q. v.*), defined as the medium of exchange, may or may not have intrinsic value. When a piece of money itself apart from its stamp is of the (commercial) value stamped upon it, it is said to be intrinsic money,

having value in itself. When it has no value in itself, or no value which makes pretense of approximating to its stamped value, but simply represents a value which the government undertakes to pay out for it whenever demanded, it is called representative money. It represents value. When, however, its value is not equal to its stamped value only because its intrinsic value has been depreciated voluntarily or otherwise, tho originally its intrinsic and commercial value were the same, it is called, not representative money, but depreciated money. Its value has depreciated. Finally, when money is issued by a government stamped as legal tender for a certain value, but with no guaranty by the government that it will be redeemed for intrinsic money, it is called irredeemable or fiat money. The government makes it worth so much. It is both representative and fiat money that we consider in this article, because such moneys are to-day almost invariably "paper money." We consider, first, its history and then the principles and problems involved in its use.

Representative money has a long history. The Carthaginians are said to have had a representative leather currency. Jevons thinks that the Byzantine iron money was probably representative money.

History

China, however, is the country which first developed the use of representative money.

Representative money in the main, however, has been used only in times of special financial pressure, as in times of war. Catherine II. of Russia issued paper in 1768 to replace the copper money. The State of Virginia placed tobacco in stores and used the receipts for money. Another form of paper money which, according to some, has played a large part in history, is the so-called bank money of the early Italian and German banks. The question, however, is involved and disputed. (See BANK OF VENICE.)

A somewhat similar system arose in England, when merchants, in order to gain greater security for their moneys, and, in part, to keep it from the government, deposited their moneys with the goldsmiths and used the receipts as representative money. It is probable that out of this system rose the modern English banks.

The best known instances of paper money in modern times are the French assignats, the issues of the American colonies, of the Continental Congress, and of the greenbacks in the War of the Rebellion. (See CURRENCY; GREENBACK PARTY.) Less known is the issue of token money by merchants as late as the eighteenth century in England, serving as promissory notes to pay money.

Coming now to a consideration of the principles and problems involved in the use of paper money, it may be said, first, that most orthodox economists believe in the use of paper money only as representative of intrinsic money, such

Arguments Against

as the gold and silver certificates of the United States or the Bank of England, which are usually "as good as gold," and must always be paid in gold, if desired, by the Bank of England, except when in times of panic the government allows the bank to pay in paper. Professor Hadley represents this, the usual conservative view, when he says ("Johnson's Cyclopaedia," article "Money"):

When bank-notes or government notes become currency, without a corresponding basis of money, nothing has ever

been able to prevent their fluctuation in value and the consequent effect upon all other values. The temptation to increase these issues according to the fancied interest of the bank or government is always likely to prove irresistible, in consequence of which the community employing them finds itself flooded with a currency upon which all values float with an unsteady motion, and any standard of value is out of the question.

Provided, however, that the paper money always does really represent intrinsic money, which can be paid for it at any time, most economists prefer paper money to metallic because it is easier to handle and to convey.

Many economists, too, think it perfectly safe to use paper money redeemable in gold or silver (for the question between gold and silver, see BIMETALLISM), but issued slightly in excess of the amount of gold and silver, since it is all but impossible that all the paper issued should be presented for redemption at one time. Jevons says concerning the various methods of the issue of paper money ("Money and the Mechanism of Exchange," chap. xviii.):

This question is perhaps the most vexed and debatable one in the whole sphere of political economy; but, by careful adhering to the analysis of facts, we may, perhaps, get a view of the subject free from the great perplexities in which it is commonly involved. The elementary principles of the subject are not of a complex character; and if we hold tenaciously to those principles, we may perhaps be saved from that dangerous kind of intellectual vertigo which often attacks writers on the currency. . . . There is plenty of evidence to prove that an inconvertible paper money, carefully limited in quantity, can retain its full value. Such was the case with the Bank of England notes for several years after the suspension of specie payments in 1797, and such is the case with the present notes of the Bank of France.

The principal objections to an inconvertible paper currency are two in number.

1. The great temptation which it offers to overissue and consequent depreciation.
2. The impossibility of varying its amounts in accordance with the requirements of trade.

It is hardly requisite to tell again the well-worn tale of the overissue of paper money, which has almost always followed the removal of the legal necessity of convertibility. Hardly any civilized nation exists, excepting some of the newer British colonies, which has not suffered from the scourge of paper money at one time or another. . . . Time after time in the earlier history of the New England and some of the other states now forming parts of the American Union, paper money had been issued and had wrought ruin. Full particulars will be found in Professor Sumner's new and interesting "History of American Currency." Some of the greatest statesmen pointed to the results; and Webster's opinion should never be forgotten. Of paper money he says: "We have suffered more from this cause than from every other cause or calamity. It has killed more men, pervaded and corrupted the choicest interests of our country more, and done more injustice than even the arms and artifices of our enemy."

A further objection to a paper money inconvertible into coin is that it cannot be varied in quantity by the natural action of trade. No one can export it or import it like coin, and no one but the government, or banks authorized by government, can issue or cancel it. Hence, if trade becomes brisk, nothing but a decree of the government can supply the requisite increase of circulating medium, and if this be put off and trade relapse into dulness, the currency becomes redundant and falls in value. Now, even the best informed government department cannot be trusted to judge wisely and impartially when more money is wanted. Currency must be supplied like all other commodities, according to the free action of the laws of supply and demand.

Some persons have argued that it is well to have a paper money to form a home currency, which cannot be drained away, and will be free from the disturbing influences of foreign trade. But we cannot disconnect home and foreign trade except by doing away with the latter altogether. If two nations are to trade, the precious metals must form the international medium of exchange by which a balance of indebtedness is paid. Hence, each merchant in ordering, consigning, or selling goods must pay regard, not to the paper price of such goods, but to the gold or silver price with which he really pays for them. Gold and silver, in short, continue to be the real measure of value, and the variable paper currency is only an additional term of comparison which adds confusion.

So far Jevons. It will be seen that his main objections to inconvertible paper money are not

so much to its use as to the danger of its misuse, or the (asserted) impossibility of its wise use. Most orthodox economists argue in the same way.

Mill argues that the value of such a currency must depend on its quantity, that it can be safely used if kept within quantities that would keep it at par with bullion; but he considers its advantages too slight to balance the danger of over-issue.

Prof. F. A. Walker sees the danger of inconvertible paper money; yet of its possible wise use he says ("Money, Trade, and Industry," p. 210):

After looking at this subject from every side, I am at a loss to conceive of a single argument which can be advanced to support the assertion of the economists, that paper money cannot perform this function of measuring values, so called. On the contrary, it appears to me clear, beyond a doubt, that just so long and just so far as paper money obtains and retains currency as the popular medium of exchange, so far and so long it does and must act as the value denominator or common denominator in exchange. And I see no reason to believe that, in this single respect, hard money, so called, possesses any advantage over issues of any other form or substance which secure the degree of general acceptance which is necessary to constitute them money.

Such being the view of paper money held by the orthodox economists, many writers, and among them not a few economists of repute and not radical in their views on other questions, believe that it is possible to have inconvertible paper money that will not be abused.

Arguments For

They argue that paper money is the best money, provided that the amount of its issue can be wisely controlled. Money, all writers admit (see CONTRACTION AND EXPANSION OF CURRENCY), is affected in its value by its quantity, in proportion to the demand for it. If the amount of money expands beyond the needs or consuming power of the people, its value depreciates. If it is contracted, its value appreciates. The problem, therefore, is to obtain an elastic currency that shall be invariable in value by varying exactly with the demand for it. Disbelievers in paper currency believe it to be impossible; believers in paper currency believe that paper money can be so used and is the only money that can be so used, or, at the least, the easiest currency to so use. For such use of paper money various plans are proposed. These plans are usually one form or another of adopting what is termed "a multiple standard" (p. 777), the essence of which is that no one commodity should be used as a monetary standard, but that a value should be averaged from a multiple of commodities. Even Jevons seems to favor this plan, altho pointing out its dangers. He says ("Money and the Mechanism of Exchange," chap. xxv.):

The difficulties in the way of such a scheme are not considerable. It would, no doubt, introduce a certain complexity into the relations of debtors and creditors, and disputes might sometimes arise as to the date of the debt whence the circulation must be made. Such difficulties would not exceed those arising from the payment of interest, which likewise depends upon the duration of the debt. The work of the commission, when once established and directed by act of Parliament, would be little more than that of accountants acting according to fixed rules. Their decisions would be of a perfectly bona-fide and reliable character, because, in addition to their average results, they would be required to publish periodically the detailed tables of prices upon which their calculations were founded, and thus many persons could sufficiently verify the data and the calculations. Fraud would be out of the question.

The only real difficulty which I foresee is that of deciding upon the proper method of deducing the average. . . . Whatever method were adopted, however, the results would be better than if we continued to accept a single metal for the standard, as we do at present.

Jevons then goes on to describe different forms of this tabular standard involved in what is now called the multiple standard:

The space at my disposal will not allow me to describe adequately the advantages which would arise from the establishment of a national tabular standard of value. Such a standard would add a wholly new degree of stability to social relations, securing the fixed incomes of individuals and public institutions from the depreciation which they have often suffered. Speculation, too, based upon the frequent oscillations of prices, which take place in the present state of commerce, would be to a certain extent discouraged. The calculations of merchants would be less frequently frustrated by causes beyond their own control, and many bankruptcies would be prevented. Periodical collapses of credit would no doubt recur from time to time, but the intensity of the crisis would be mitigated, because, as prices fell, the liabilities of debtors would decrease approximately in the same ratio.

More recently Prof. E. B. Andrews, in his "An Honest Dollar," has made a strong plea for such a multiple standard, and in the appendix to his book gives much consideration to its details. Many other economists favor this plan, at least when the community is educated to adopt it.

It is under such form that most of the advocates of paper money now advocate the adoption of paper or fiat money. An inelastic currency, they say, must rob either creditors or debtors. In times of panic and financial pressure even now, they say, the community has to resort to paper money. In panics a special act of Parliament allows the Bank of England to pay in paper. In times of panic the New York banks use clearing-house certificates. In times of depression most Western States pay salaries in receipts which are made payable for taxes.

Many believe that this system could be adopted in the conduct of public work on the so-called Guernsey plan, of which Jevons says ("Money and the Mechanism of Exchange," chap. xvi.):

Daniel le Broc, the governor of the island, determined to build a market in St. Peters, but not having the necessary funds, issued under the seal of the island 4,000 market notes for one pound each, with which he paid the artificers. When the market was finished and the rents came in, the notes were thereby canceled, and not an ounce of gold was employed in the matter.

PARIS: Paris, to the social reformer, suggests revolution and the struggles of the Commune, but it has something to teach in its present as well as in its past. (For its history see FRANCE AND SOCIAL REFORM AND PARIS, COMMUNE OF.) It was the first city to illustrate to the world the advantages of symmetry, spaciousness, order, and convenience in the planning of its streets; of wholesomeness and cleanliness and light in its municipal arrangements. It is, however, in spite of this, the most crowded city of the world. On its 19,200 acres live 2,269,023 persons, making a density of 117 persons to the acre, while Berlin, the next most crowded, has only 85, and New York, the next, has 60, while London has only 51. Paris's broad streets and boulevards have been built too often by driving the poor into crowded, narrow streets. The organization of the municipality is unique even in France. Alone among French cities Paris has no mayor, this being due to the fear the government has of the revolutionary tendencies of the Paris Commune. The city is ruled, as a whole, by the prefect of the department of the Seine, and by his colleague, the prefect of the police. There is, however, a municipal council

with considerable power, and twenty wards or *arrondissements*, over each of which presides a *maire* in a ward building called the *mairie*. The prefect of the police has, perhaps, the greatest power. He has vast sums at his disposal, of which he need render small account, and governs not only the ordinary police force, but the police *judiciaire*, the detective force, and the political police, the government's secret agents, an inheritance of power from the Napoleonic administration, characteristically preserved by the bourgeois republic. He is only prevented from being despotic by the perfect clock-work organization of the departments of the city. Paris has some magnificent streets, e. g., the Boulevard des Italiens and the Boulevard Haussmann—where luxury and elegance abound; also over 130 beautiful squares, e. g., the Place de la Concorde—connecting the gardens of the Tuileries with the Champs Élysées; the Place de la République; the Place du Carrousel; the Place de l'Opéra; the Place Vendôme; etc. Most of them have statues commemorating public men or events. The theaters, picture-galleries, e. g., that of the Louvre, the hotels, and other attractive features, furnish not only amusement to numerous visitors, but instruction of the highest type.

Municipal ownership of public utilities is well developed in Paris. The Board of Health consists of men who have a high standing in scientific circles and among engineers. The sanitary regulations of workshops, dwellings, and schools, the drainage, water-supply, and cemeteries, are supervised and managed by the board. The city owns all markets, slaughter-houses, cattle-yards, which yield a good income to the treasury. The city was authorized by the national government in 1898 to build a system of electrical railways to be operated by a private company on lease.

The department of "Public Assistance" has charge of the poor relief, and is a well-organized body, managing all the hospitals, shelters for the poor and aged, cripples, orphans, outdoor relief, etc. A free employment bureau (see PUBLIC EMPLOYMENT BUREAUS) aids those out of work and is supplemented by a labor exchange.

PARIS, COMMUNE OF: We consider here particularly the Paris Commune of 1871, but several times in French history has the Paris Commune risen in rebellion against the general government, and tried to establish a communal self-government, to be federated with other self-governed communes. A commune in France is the area ruled over by a mayor or a municipal government. The federated and more or less communistic but autonomous rule of the commune has been the ideal of not a few of the older French Socialists, the so-called communards of France. They feared, as too highly centralized, the collectivism of Marxist socialism, and really held a view half anarchist-communist and half Socialist. The view is passing away, but has played no small part in French history. (See FRANCE AND SOCIAL REFORM.) In 1556 Stephen Marcel, during the English invasion, endeavored to form a confederation of sovereign communes with Paris as the governing head. In 1588 the commune of Paris did succeed in obtaining independent self-government for six months. May 21, 1791, the Revolutionary Committee of the insurrection of July, 1789, replaced the town coun-

cil, and took the name of "Commune of Paris." It had great power under Robespierre, but fell with him, July 14, 1794, and was replaced by twelve municipal divisions. Partly as a result of this, Paris to-day has no mayor of the whole city, being largely ruled by the general government. (See PARIS.) Once again, on March 18, 1871, Paris rose in revolt against the then newly established republic, and declared the Commune March 28th. It seemed an opportune time to the leaders. France had been defeated by Germany; Paris, after a long siege, had been occupied by the Germans, who now were gone; a republic had been established, but the communards believed it to be a weak, corrupt affair of the bourgeoisie. The communards declared that the republic had sold Paris to the Germans. They therefore rose and declared the Commune. Similar risings, instigated in part by Bakounin and the anarchist communists, took place in Marseilles and other French cities, but were quickly suppressed. In Paris was the main success. The leaders of the Commune were Flourens, Félix Pyat, Assi, Delecluse, Paschal, Grousset, General Cluseret, Dombrowski, Arnauld, Vallès, Blanqui, and Rochefort. A large part of the National Guard of Paris declared for the Commune, with headquarters at Belleville and Montmartre. March 26th an election was held and the members for the communal government were chosen; 180,000 votes were cast. The republican government at Versailles sent an army to suppress the Commune. Under the command of Marshal MacMahon this army besieged Paris. April 5th the communards arrested Darboy, Archbishop of Paris, and other prisoners, and held them as hostages. The Commune declared its principles to be absolute individual liberty by the means of the suppression of government, and the division of nationalities into communes more or less federated. The present holders of capital were to be dispossessed, with compensation, and the land and capital were to be divided among associations of workmen. An English Socialist who was in Paris during the Commune declares that Paris was never so free from want, crime, or vice, but others there assert the exact contrary. Many of all classes joined the popular cause. But gradually dissension arose and mistakes were made. The besieging army took many forts and finally entered Paris, 90,000 strong, on May 22d. The communards resisted for five days in the streets. The republican army having put many prisoners to death, the communards retaliated by shooting Archbishop Darboy and other hostages. Terrible reprisals were made on both sides. The communards being finally defeated, and losing power, took revenge by burning the Tuileries, the Palais de Justice, the Palais Royal, the Hôtel de Ville, and other buildings connected with the hated government. This act and the shooting of the archbishop and other captives have been laid to their charge, but it must not be forgotten that the triumphant republicans shot the communards down by the thousand in cold blood, burying them in prepared ditches. Twenty-five thousand communards were taken prisoners and many thousands deported. The leaders were mainly executed.

PARKER, JAMES: Member British Parliament of the Independent Labor Party for Halifax; born at Awethorpe, Lincolnshire, 1863. He was educated at South Wesleyan School, and Bramhope School. In 1895 he was appointed paid secretary of the Halifax branch of the Independent Labor Party, after having served as president of the Gas Workers' and General Laborers' Society, and of the Trades and Labor Council. He has a thorough knowledge of Yorkshire and its industries, and has considerable experience in municipal affairs, having served in many responsible positions at Halifax during seven years, e. g., as chairman of Waterworks Committee, and as member of the Chamber of Commerce. He was elected to Parliament in 1906. Address: 22 Salisbury Place, Halifax, England.

PARKHURST, D.D., CHARLES H.: Clergyman; reformer; born Framingham, Mass., 1842; educated in public schools, Amherst College. Four years principal of Amherst High School;

veloped into the famous Central Park. In 1854 the city of Paris took steps to supply itself with parks; in England only a little before this there were three small park undertakings.

As late as 1870 Central Park was still uncompleted, although the city had then increased to over 900,000. It required a large degree of faith even then to see any decided advantage in sinking \$5,000,000 in a piece of land four miles away from the center of population, to reach which there was no steam transit. It was said at that time, that "For practical, every-day purposes, the great mass of people might have been 100 miles away." Only a few years later there was scarcely a city of the world making any claims to prominence and progress that was not providing itself with parks. The newer cities made provisions for parks in the laying out of the cities.

What has been already accomplished in this country and in the leading cities of Europe can be seen in the following tables:

THE UNITED STATES

(From Statistics Prepared by the United States Government, 1900)

¹ Washington, D. C.; 3,596.27 acres owned by the United States Government.² Not given.

two years professor of Greek, Williston Seminary. Studied theology at the Universities of Halle and Leipsic; ordained pastor of Congregational Church, Lenox, Mass., 1874; called in 1880 to the Madison Square Presbyterian Church in New York, where he is still pastor. In 1891 was made president of the Society for the Prevention of Crime, and in this office made such effective investigation into conditions of vice as led to a revolution at the next election of city officers. Dr. Parkhurst is deeply interested in social questions and has indicated his standpoint by calling himself a Christian Socialist. Author of "The Blind Man's Creed," "Our Fight with Tammany," "Guarding the Cross with Krupp Guns," and many sermons and addresses and frequent contributions to periodicals. Address: 133 East Thirty-fifth Street, New York City.

PARKS (see also PLAYGROUNDS): The question of parks is of modern origin, growing out of the rapid growth and overcrowding of our cities. It was in 1851, when the population of New York City was just above the 500,000 mark, that the state legislature passed an act for the creation of a park in the city, which afterward was de-

EUROPE

Philadelphia has the largest single city park in the world, containing 2,648 acres, extending for some twelve miles on either side of the Schuylkill River, and beautifully laid out in walks and drives.

The famous royal Epping Forest, near London, is the largest park absolutely.

Zoological and botanical gardens are also now not uncommon in the larger cities. Central Park in New York, and Fairmount Park in Philadelphia, have zoological exhibits or menageries. There are beautiful botanical gardens at Washington and St. Louis. The zoological park at the national capital will be one of the finest in the world. Among the best known in Europe are the famous "Zoo" at Regent's Park, London, the Jardin des Plantes and the Jardin d'Acclimatation in Paris. Bronx Park, New York City, is a zoological park and botanical garden.

Concerning the creation and need of small parks Mr. Alfred R. Conkling says ("City Government in the United States," pp. 55-59):

In 1884 an act was passed by the New York Legislature to create new public parks. It was argued that this was the time to acquire land for park purposes, lest it should become too valuable if further delay were made. It was enacted that several new parks should be established, but the nearest proposed site was about seven miles from the densely populated district of Manhattan Island. Since the passage of the law about \$10,000,000 have been expended in buying parks at the upper end of the city of New York.

Paris is now the pleasure city of the world, and foreigners from all countries, especially from South America, make their home there. The permanent leisure population of foreign birth in Paris is probably larger than in any other city. This feature of Paris is owing to the policy of Napoleon III., and largely to the number of public parks and parkways.

Skilful architects should be employed to lay out public parks, and their management should not be entrusted to the ordinary ward politician, who is inclined to enrich himself, or to propose improvements for the purpose of helping some contractor who belongs to his political organization. A small public park can often be established at slight expense by using a V-shaped lot, formed by the intersection of a diagonal avenue with a longitudinal street.

In American cities music is provided at public expense on Saturdays, and in some cities on Sundays. In Europe the bands of the standing army, which are, of course, paid for by taxation, perform in the public parks very frequently.

Dr. E. R. L. Gould says (publication of the American Statistical Association, 1888):

Large cities should follow the advice of Professor Jevons: Build pavilions for winter use in one or two of the principal parks, and maintain all the year around orchestras and bands of music, with other light attractions, to provide entertainments, either wholly free to the public or at a merely nominal rate of admission. There should be at least one crystal palace in every great city. During the summer months concerts should be given as often as every other week-day evening in every one of the large and moderately sized spaces.

PARKS, SAMUEL J.: Delegate of the House-smiths' and Bridgemen's Union; born 1863. He became prominent as an organizer of the housesmiths and bridgemen, and was so successful that he cemented these hitherto loosely organized men into one of the strongest unions. As

soon as he had succeeded in this, he used his power to declare strikes, and had the unparalleled record of 5,000 in seven years—an average of two per day. Since there was a great demand for new buildings from 1896-1903, he won with few exceptions, and thus raised the wages of his union from \$2 to \$5 a day. In June, 1903, he was arrested and indicted on the charge of having received \$2,000 from the Hecla Iron Works in Brooklyn, as the price of settling a strike in April of the same year. He was convicted on this charge, and sentenced to two years and six months in Sing Sing prison. His union voted to continue his salary of \$48 a week, for the entire period, if necessary. He was, however, released before he had been there a week, "on a certificate of reasonable doubt." Shortly after his release, the "doubt" was removed; Parks was sent back to prison, where he died, May 4, 1904.

PARLIAMENT (from old French *parlement*, a speaking): A name given to deliberative assemblies, especially to the legislatures of Great Britain and her self-governing colonies. The origin of Parliament in Great Britain is obscure, save that there is no doubt that alike in Saxon and Norman times the English people had some share in making the laws whereby they were governed. The Magna Charta of 1215 recalled some of those forgotten rights, but the first Parliament of which any record is preserved was called in 1265 by a writ of Henry III., summoning the knights, citizens, and burgesses to meet in Parliament. Down through the fifteenth century all these classes met together in one house. To-day Parliament consists of monarch, lords, and commons. The three estates of the realm are lords spiritual, lords temporal, and commons.

The House of Lords has 613 members—3 peers of the blood royal, 2 archbishops, 22 dukes, 23 marquises, 124 earls, 40 viscounts, 24 bishops, 331 barons, 16 Scotch peers, 28 Irish. The House of Commons has 670 members, chosen by a male suffrage, considerably qualified by losing residence through removals. The universities have 9 seats; England, 460 (counties, 253; boroughs, 237); Wales, 30 (counties, 19; boroughs, 11); Scotland, 70 (counties, 39; boroughs, 31); Ireland, 101 (counties, 85; boroughs, 16).

The House of Commons imposes taxes and raises money. At present members are elected for seven years. Parliament assemblies and is dissolved and a new Parliament elected on the summons of the sovereign; it must be assembled at least once in three years. Practically it is called every year. It commences with a speech from the throne. No member can be questioned outside of Parliament for what he has said within it, and is free from arrest in civil causes, but may be adjudged bankrupt, and his goods taken. Every bill must be read three times before each house, and also be reviewed clause by clause by select committee, or by the whole House as a committee.

Unless sooner dissolved, a Parliament lasts for seven years. It meets usually the middle of January or soon after, and is prorogued when its work is done, usually now in August or September, tho either house may adjourn for a short time. The members of the government occupy the benches on the right, the opposition on the left. The speaker is not a party leader, but elected by the House and supposed to be strictly

Constitution
of

impartial. Each party has its own leader and "whips." The cabinet, which sits in the House, tho technically a committee of the Privy Council and chosen by the king, is practically a committee of the House of Commons, and responsible to it. When, therefore, a cabinet measure is defeated in the House, the Prime Minister resigns and a new minister with a new cabinet is chosen, representing the majority in the House. The cabinet consists of the Prime Minister, First Lord of the Treasury (£5,000), Lord High Chancellor of Great Britain (£10,000), Lord President of the Privy Council (£2,000), Lord Privy Seal (unpaid), Chancellor of the Exchequer (£5,000), Secretary of State for the Home Department (£5,000), Secretary of State for Foreign Affairs (£5,000), Secretary of State for the Colonies (£5,000), Secretary of State for War (£5,000), Secretary of State for India (£5,000), First Lord of the Admiralty (£4,550), Chief Secretary to the Lord Lieutenant of Ireland (£4,425), Secretary for Scotland (unpaid), Chancellor of the Duchy of Lancaster (£2,000), President of the Board of Trade (£2,000), President of the Local Government Board (£2,000), President of the Board of Agriculture (£2,000), President of the Board of Education (£2,000), Postmaster-General (£2,500). The chairman of the House of Lords is the Lord Chancellor. The question most bruited to-day as to the organization of Parliament is as to the House of Lords. (See also PAYMENT OF MEMBERS.) Radicals and the Labor Party in Parliament desire the abolition of the House of Lords, and the Liberals would abridge its powers. A resolution was carried in the House, June, 1907 (432 to 147), to the effect that the House of

Limitation of the House of Lords

Lords should not have power to alter or reject bills passed by the House of Commons, except within the limits of a single Parliament. In 1886 a somewhat similar resolution was defeated by 202 to 106; in 1888, by 223 to 162; by 201 to 160 in 1889; by 201 to 139 in 1890. An amendment to the resolution (of June, 1907) to abolish the House of Lords was defeated by 315 to 100, few besides the Labor Party and Radicals voting for it. The House of Lords, however, cannot block, only retard legislation.

Says Arnold White (*Everybody's*, July, 1907):

"The powers of the Lords already have been restricted until the control of the Commons in all the great affairs of State is practically supreme. The Lords may not meddle with money bills; have no control over the navy or army; may not interfere with the control of the House of Commons over foreign and colonial affairs, matters relating to peace and war, treaties, nor internal administration. The Lords cannot upset the cabinet nor exercise control over the monarch. All these things are in the domain of the elected House. Practically the only power left to the Lords is that of the veto, which is now threatened."

Mr. White gives no favorable view of the composition of the House of Lords. He says: "There are only sixty peers who can boast of old titles. There are, in fact, two orders in the House of Lords, and the peers themselves never forget the difference between the old and the new men. Since the great Reform Bill, Liberals have created 232 peers to 131 created by the Conservative and Unionist governments."

"Many peerages are granted as the result of bargains between party managers and aspirants to hereditary honors. The sale of peerages and other titles has now reached such a point that the man in the street has begun to grumble. Mr. Gibbon Bowles has publicly declared without contradiction that a very large sum was placed at the disposal of Mr. Balfour and his chief whip before the last election. Mr. Bowles supports his statement by saying that the election fund has been enriched by the recipients of titles who have paid sums varying between £30,000 for a knighthood and £200,000 for a new peerage. Mr. Bowles goes on to say that it was calculated a year ago that at least £500,000 must have been encashed from various sources by the party fund. "The most telling attacks upon the House of Lords are,

however, based upon its 'black sheep,' tho these are perhaps not more numerous than in other walks of life.

"Of the twenty-two English dukes in the peerage of England, there are only five whose circumstances, abilities, and career entitle them to be regarded as possible leaders of the nation. The Dukes of Norfolk, Bedford, Devonshire, Portland, and Richmond have maintained the best traditions of public service. As for the other dukes, matrimonial scandals, impunctuality, or dissoluteness are, or should be, disqualifications for membership of an assembly that confers hereditary powers of government upon its members.

"Among the eighty viscounts, the names of St. Aldwyn and Wolsley are the only two of distinction.

"All bishops of the Established Church are members of the House of Lords, to which they add no strength. They were originally created peers because they were territorial magnates, not because of their ecclesiastical rank, and since they parted with their landed possessions their presence in Parliament is an anachronism since the nonconformist ministers, Catholic priests, and Jewish rabbis are excluded."

The Earl of Dunraven, defending the House of Lords (*The Nineteenth Century and After*, March 1907), says:

This body contains 173 members who have held office under the State exclusive of household appointments, 166 who have sat in the House of Commons, 140 who are or have been mayors or county councilors, about 40 who are members of the legal profession, and about the same number of men eminent in art, science, letters, invention, manufacture, and trade; 207 have served, or are serving, in the army or navy. Furthermore, it must be added that, in addition to those who have acquired merit and knowledge as chairmen of railway companies, and in other positions of an analogous character, the great majority have developed business habits, and have derived valuable experience of men and matters in the management of large estates and complicated affairs.

Unquestionably the whole consensus of educated opinion in the United Kingdom is in favor of a second chamber; the principle has been approved and adopted in our great self-governing colonies, in the United States, and, in fact, throughout the world wherever democratic systems obtain; the belief in the necessity of a revising chamber in order to insure that the permanent opinion of the people may receive adequate expression is practically universal.

The political composition of the House changes, of course, more or less with each election, and not seldom very completely, as in the last election, and is even constantly changing on the account of bye-elections to fill vacancies. Concerning the present and recent composition of the House, *Hasell's Annual* for 1907 gives the following tables of parties in the House of Commons since 1832:

| GENERAL ELECTION | Liberals | Labor | Con- servative | Liberal Unionist | National- ist ¹ | Total |
|------------------|----------|-------|-------------------|---------------------|-------------------------------|-------|
| 1832..... | 514 | | 144 | | | 658 |

¹ At the dissolution in 1892 the state of parties was—L. U. 65; L., 215; C., 304; N., 56; P., 30.
² The figures here show a Gladstonian majority of 42, but this had immediately before the general election of 1895 dwindled to 28.
³ Including six Parnellite members for boroughs and six for counties.
⁴ See figures as to state of parties, Nov. 30, 1905, on p. 429.

constituencies the votes cast for all the candidates on either side are added together and divided by two:

| | Liberal and Labor | Unionist | Majority |
|--------------------------------------|-------------------|------------------|------------------|
| England: | | | |
| London..... | 278,299 | 245,723 | L 32,576 |
| Boroughs..... | 809,818 | 634,637 | L 175,181 |
| Counties..... | 1,418,212 | 1,195,558 | L 222,654 |
| Total England..... | 2,506,339 | 2,075,918 | L 430,421 |
| Wales..... | 171,315 | 96,912 | L 74,403 |
| Scotland..... | 366,605 | 233,901 | L 132,704 |
| Total Great Britain.... | 3,044,259 | 2,406,731 | L 637,528 |
| Ireland..... | 350,000 | 150,000 | L 200,000 |
| Total for United Kingdom..... | 3,394,259 | 2,556,731 | L 837,528 |

Liberal majority in 1892, 200,000; Unionist majority in 1895, 104,000; and in 1900, 123,000.

The *Reformer's Year Book* for 1907 gives the following analysis:

The strength of parties as the result of the general election was as follows:

| | |
|--------------------------------|-----|
| Official Liberals..... | 381 |
| Liberal Trade-Union Party..... | 19 |
| Unionists..... | 157 |
| Nationalists..... | 83 |
| Labor Party..... | 30 |
| | 670 |

Allowing for the loss of one Unionist vote by the election of Mr. Lowther as speaker, the official Liberals had a majority of 93 over all other parties. The official and Trade-Union Liberals together had a majority of 131 over the parties sitting in opposition.

PARSONS, FRANK: Writer, educator, and authority on public ownership; born Mt. Holly, N. J., 1854; graduated in mathematic engineering course, Cornell, 1873; did engineering, taught school, and was admitted to Boston bar; lectured on economics; professor of history and political science, Kansas Agricultural College, 1897-1900; lecturer on law, Boston University, 1892-1905; has traveled extensively in the United States and Europe, lecturing and studying economic facts; testified before the U. S. Industrial Commission, on transportation (see vol. ix. of the Report), 1901-2; member of the Public Ownership Commission of the National Civic Federation, and one of the special committee of four to write up the results of the investigation, 1906-7. (See PUBLIC OWNERSHIP.) President of the National League for Promoting Public Ownership of Monopolies. His economic views may be summed up as a system of mutualism or cooperative industry through public ownership in the field of monopoly and voluntary cooperation in commerce, manufactures, and agriculture. Author, among other works and very numerous articles, particularly in *The Arena*, of "The World's Best Books" (1892); "Rational Money" (1899); "The New Political Economy" (1899); "The City for the People" (1900); "Direct Legislation" (1900); "The Telegraph Monopoly" (1902); "The Story of New Zealand" (1904); "Heart of the Railway Problem" (1906); "The Railways, the Trusts, and the People" (1906).

Also chapters on "Legal Aspects of Monopoly" and "The Telephone" in "Municipal Monopolies" (1900), and on "History of British Tramways" in Report of National Civic Federation Commission on Public Ownership (1907). Address: 11 St. James Avenue, Boston.

PATENTS: A patent is the grant by government to the author of an invention, or to his heirs, of the exclusive right to use or sell the invention for a fixed number of years. It is also used—alho this is an older meaning and is passing out of use—of the instrument or letters by which a grant of land is made by a government to a person or corporation.

Provision was made by Congress, in 1790, for giving to inventors the exclusive right to their discoveries. At present patents are given for seventeen years (except for design patterns) to any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter or any new and useful improvement thereof, or any new original and ornamental design for an article of manufacture, not known or used by others in this country before his invention or discovery thereof, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof or more than two years prior to his application, and not in public use or on sale in the United States for more than two years prior to his application, unless the same is proved to have been abandoned; upon payment of the fees required by law and other due proceedings had.

Among the peculiarities of the patent laws of the U. S. it may be mentioned that the term for which they are granted, seventeen years, is longer than in any other country. The development of the patent system in the U. S. far exceeds that of any other nation. For United States several years the number of patents issued in the U. S. has been nearly equal to the number issued by all other civilized nations together. A pamphlet containing the "Patent Laws and Laws Relating to the Registration of Trade-marks and Labels," and one containing the "Rules of Practice in the U. S. Patent Office," are published by the office, and can be obtained, free of charge, by any one desiring them, on application by mail to the Commissioner of Patents.

The English Patent Law is very generally criticized. Commissions have reported and various suggestions have been made, yet the present law is far behind the needs of the times. Patents are granted for fourteen years, but subject to renewal fees, and so hedged about and uncertain, that it is said that only 3 per cent of the patents are remunerative. The evils of the present law are that there is a great deal of uncertainty in the mode of ascertaining what is a new invention. Hence, when a patent has

PATENT IN THE UNITED STATES

¹ Registration of labels practically suspended May 27, 1891, under decision of United States Supreme Court. Resumed June 9, 1896. No prints included prior to 1893.

been granted, if it is of such a nature as to lead to competition, infringements are almost matters of course, and the only mode of discovering and checking the infringement is so tedious, costly, and ineffective that inventors generally pass their lives in constant litigation, fighting in detail a succession of imitators who often have nothing to lose by defeat, and therefore entail all the greater burden on the legitimate manufacturer. This is discouraging to inventors, and increases the cost of many articles. A writer in the (English) *Reformer's Year Book* for 1907 says:

We have quantity in invention, but not quality, and the latter can never be attained except by taking over the American Patent Law *en bloc* here in place of our own, which is hopelessly out of date. What is termed "provisional protection" with us is practically no protection at all, and it is said to have been solely introduced into our system to provide extra fees for crown lawyers.

The term "Patent Office" for the office of issue is a misnomer. Its proper name would appear to be the "Designs and Trade-marks Office," since it issues over 53 per cent of monopolies to wealthy manufacturers and merchants at 5.8 per cent of the general charge. Our inventors paid 88.8 per cent of the total charge of the establishment, although they only got 3.3 per cent of the monopolies issued, and these as a rule are not allowed to live long enough to pay back their cost, or to get into general use.

Where the wisdom comes in of treating scientific and other inventors in this way nobody knows, as it necessarily confines invention in this country within its narrowest limits.

The Patent Office, in fact, has been run for any object but the promotion of practical invention (which alone benefits the public). Fees for agents, patent cases for lawyers, and the payment for rich men's monopolies by victimizing inventors, are apparently the sole object for running the Patent Office. Meanwhile, the preparation of valuable inventions, such as Edison's, in this country is out of the question. All such inventions have to be evolved in America, and come to us second hand, costing many times what they would had they been evolved in this country, and under similar circumstances, by our own inventors.

Our whole patent system is thoroughly bad, and the law will have to be taken in hand and brought up to date on American lines.

France.—Grants of patents (*brevets d'invention*) are granted to inventors or their assignees, whether natives or foreigners, and the French patent expires with any foreign patent of earlier date. Applications for French patents must be made prior to the filing of the complete specification in any foreign country. Patents are granted for a term of fifteen years upon payment of an annual duty of \$20.

Germany.—Patents are granted for fifteen years to natives and foreigners. The invention must not have been previously described in a printed publication in any way. The patentee may obtain supplementary patents for improvements expiring with the original patent. A govern-

ment duty of \$7.30 is paid on the issue of the patent, together with an annuity.

The governments of Belgium, Brasil, France, Guatemala, Holland, Italy, Portugal, San Salvador, Servia, Spain, Switzerland, and Great Britain have signed an international convention relating to patents, giving the patentee in any country in the convention various rights, of which the most important is that the subjects of each of the above states shall, in all the other states, as regards patents, enjoy the advantages that their respective laws grant to their own subjects.

Inter-national Patents

Socialists and extreme individualists have almost invariably opposed patent laws. Individualists would have every one depend in free competition upon his own wits, with little or no defense from governments. Socialists would have every invention used for the good of all, inventors being rewarded not by being given a monopoly of their inventions but by material or other honorary reward. Patents, they argue, to-day do not usually reward the real inventor, but some rich corporation or individuals, who can afford to buy up the patent and push it for their advantage, or more likely put it upon the shelf, to prevent its competing with their present processes. Patents therefore, they claim, rarely aid the real inventor and usually defraud the public of the advantage of inventions. The only inventors who are aided are, usually, very wealthy ones who need it least. Poor inventors rarely have the capital to set their invention in use and, therefore, have to sell it, at terms which, after paying the fees and going through the tedious process of securing a patent, leave them usually more poorly off than if there were no patent laws.

PATON, JOHN BROWN: Principal Emeritus Congregational Institute for Theological and Missionary Studies; born in 1830 at Newmilns, Ayrshire, Scotland; educated at London parish school; private school in Dorset; Spring Hill College, Birmingham. Ordained a Congregational minister; was from 1854 to 1863 in charge of Wicker Church, Sheffield; 1863-98 first principal Congregational Institute at Nottingham. Not content merely to criticize or destroy things old and past then in use, Dr. Paton is a reformer in the true sense, philosophically and constructively.

One whose word is a power but whose deeds are his mightiest words. Associate editor for six years of the *Contemporary Review*; joint editor of the *Eclectic Review*; assisted in founding University Extension System; founder and honorary secretary of Bible Reading and Prayer Union, the National Home Reading Union, the Recreative Evening Schools Association, Social Institutes Union, and English Land Colonization Society; chairman of the Committee of the Christian Union for Social Service, and Vagrant Children's Protective Committee; first president, 1896-1902, of the Licensing Laws Information Bureau, and of the Cooperative Holidays Association; founder of Boys' and Girls' Life Brigades; Young Men's and Young Women's Brigade of Service, and of Boys' and Girls' League of Honor; in 1904 vice-president of British Institute of Social Service. Author of "The Twofold Alternative," "Materialism or Religion," "The Church, a Priesthood or a Brotherhood," "The Inner Mission of the Church," "The Inner Mission of Great Britain," six booklets on social questions of the day, two volumes of Essays: I., "Church Questions of To-day"; II., "The Apostolic Faith and Its Records," besides many articles in reviews on educational and social questions. Address: 22 Forest Road West, Nottingham, England.

PATRONS OF HUSBANDRY. See GRANGE.

PATTEN, SIMON NELSON: Professor of political economy; born 1852 at Sandwich, Ill.; graduated as Ph.D. from the University of Halle, Germany, 1878; appointed professor of political economy at the University of Pennsylvania—the position he still occupies. Professor Patten declares that his interests in economics have been mainly centered in the consumption of wealth, in the economic interpretation of history, and the relations of sociology to economics. Patten is author of "Premises of Political Economy," "The Economic Basis of Protection," "Theory of Social Forces," "Development of English Thought," "Theory of Prosperity," "Heredity and Social Progress," "The New Basis of Civilization." Address: University of Pennsylvania, Philadelphia.

PAUPERISM AND POOR RELIEF. (See also POORHOUSES; POOR-LAWS; POVERTY; POVERTY IN THE UNITED STATES.) For the general statistics and consideration of poverty, see POVERTY. We consider in this article: I. Pauper Statistics. II. Poor Relief.

I. Pauper Statistics

The United States.—There were reported in 1903 in the U. S. 2,476 almshouses with 81,764 paupers.

| SEX | Paupers Enumerated in Almshouses | | | |
|----------------|----------------------------------|--------------|----------------------------------|--------------|
| | Number | | Number per 100,000 of population | |
| | Dec. 31, 1903 | June 1, 1880 | Dec. 31, 1903 | June 1, 1880 |
| Both sexes.... | 81,764 | 66,203 | 101.4 | 132.0 |
| Males..... | 52,444 | 35,564 | 127.0 | 139.4 |
| Females..... | 29,320 | 30,639 | 74.5 | 124.4 |

¹ Based on assumption that the sex distribution was the same on Dec. 31, 1903, as on June 1, 1900.

The statistics previous to 1880 are declared by the census to be too inexact to be comparable with these. From 1880 to 1903 the number of paupers in almshouses has decreased 30.6 per 100,000 of population. This diminution appears to have gone on uniformly, being 15.4 per 100,000 of population in the decade 1880 to 1890, and 15.2 during the longer period from 1890 to 1903.

| COLOR AND NATIVITY | Per Cent | | | |
|-----------------------|-----------------------|-------|---------------|--------------|

Great Britain.—In England and Wales there were in receipt of poor relief in Great Britain, Jan. 1, 1906, 926,741 persons, or 27.1 per 1,000 of population. In London it was 31.7 per 1,000. This includes the sane, insane, and casual paupers. Forty-five per cent of the paupers (exclusive of the sane and casual) consisted of 113,864 families. The *Year Book of the Daily Mail*, 1907, gives the following table and analysis:

| DESCRIPTION | England and Wales | | |
|-------------------------------|-------------------|---------|----------|
| | Men | Women | Children |
| Indoor..... | 120,677 | 80,715 | 61,244 |
| Outdoor..... | 106,995 | 275,292 | 179,953 |
| Lunatics in asylums, etc..... | 39,089 | 46,027 | 705 |
| Total..... | 266,761 | 402,034 | 241,902 |

The general decline of pauperism in comparison with past years will be apparent from the following figures:
Average rate of paupers relieved per 1,000 of population in each period:

| | Per cent |
|----------------|----------|
| 1872-1877..... | 35.4 |
| 1878-1884..... | 31.2 |
| 1885-1892..... | 28.6 |
| 1893-1901..... | 26.6 |
| 1902-1906..... | 26.4 |

The average rate of pauperism is higher in proportion to population in the rural districts than in the districts which are wholly urban or nearly so.

The total cost of the relief of the poor, and matters connected therewith, in the years 1904-5 was £13,851,981 in England and Wales; in Scotland it was £1,402,354, and in Ireland £1,253,355.

In 1864 the cost of 999,400 paupers was £6,423,381; the cost of 769,029 paupers in 1904 was £13,369,494. In the same period the cost of superintendence increased by £1,062,752, although the number of paupers had considerably decreased.

On the other hand, A. L. Bowley ("National Progress in Wealth and Trade," pp. 22, 23) shows an increase of pauperism from 1884 to 1903. He says:

The number of so-called adult able-bodied male paupers has increased nearly as fast as the population in the last fifteen or twenty years, and faster if we include vagrants. The last five years show, however, a marked improvement over 1894-98. On the other hand, the number of female paupers shows a rapid and very satisfactory decrease. The following table shows these facts in more detail:

| ENGLAND AND WALES | | | | | | | | | |
|-------------------|---------------------------------------|-------------------------|---------|-------------------------|----------|-------------------------|--------------------|-------------------------|---|
| YEARS | Able-bodied male paupers and vagrants | | | | | | | Able-bodied women | |
| | Indoor | Per 10,000 ¹ | Outdoor | Per 10,000 ¹ | Together | Per 10,000 ¹ | Excluding vagrants | Per 10,000 ¹ | Indoor and outdoor. Per 10,000 ² |
| | | | | | | | | | |
| 1884-88... | 16,920 | 20 | 17,650 | 21 | 34,570 | 41 | 29,340 | 35 | 42 |
| 1889-93... | 20,940 | 23 | 15,090 | 18 | 36,030 | 40 | 29,550 | 33 | 36 |
| 1894-98... | 33,140 | 34 | 15,550 | 16 | 48,690 | 50 | 36,940 | 38 | 35 |
| 1899-1903. | 33,310 | 32 | 12,010 | 11 | 45,320 | 43 | 32,820 | 31 | 29 |

¹ Per 10,000 males over fifteen years of age in England and Wales.

² Per 10,000 females over fifteen years of age in England and Wales.

Other Countries.—Of the statistics of pauperism in other countries we have meager returns. Germany has not published pauper returns since 1885. In that year there were reported 1,592,386 receiving public aid in the empire. In France in 1904 the public "bureaux de bienfaisance" assisted 1,381,387 persons. There were also aided 120,126 children; there were 1,826 in hospitals, 70,518 imbeciles in asylums (public and private), 68,670 aged and infirm in institutions, 2,912,600 received gratuitous medical assistance. In Denmark (1903) 177,109 persons were aided, in Sweden (1904) 234,639, Norway (1904) 88,182.

II. Poor Relief

United States.—There is no national poor-law system in the U. S. and the systems of the various states vary somewhat, but have certain general characteristics in common. In general, American poor laws are based on the English. Relieving officers care for the indigent, being county officers in the Southern states, in Pennsylvania, and in all states west of the Mississippi, except Minnesota, and town (or township) officers in Minnesota, the middle Atlantic states, and New England. State governments in general control relief institutions. Near relatives are obliged to support, but details vary in different states. The present tendency is toward stricter laws against wife and family desertion. Settlement is usually gained by residence of longer or shorter duration (generally longer in the East). Most states have laws against the coming or immigration into the state of those likely to become paupers. In most states tramping, or vagrancy, is punishable. Usually vagrants are committed to jails, for a longer or shorter period, sometimes with labor, sometimes without. Sentences are usually harder in the East, but frequently great hardships are affixed, as with chain gangs in some states, and often great wrongs

done, owing largely to the general practise of giving officers a fee for each vagrant brought in and confined. Indigents are divided, generally, into three classes: adults able to work, but in extreme indigence; those defective or unable to work, and neglected or abused children. For the first class, the almshouse is "the fundamental institution," and is everywhere found, tho increasingly, and by law, various classes, like children, the insane, etc., are being placed in special institutions. Outdoor relief is also extensively given in most states, tho it is being practised less in most states. In most large cities there is a charity department of some sort; but in many cities it is little developed, private charities doing more. State boards of charities exist in many states, usually with limited control over institutions, but sometimes they are boards of control. In many cases relieving officers simply perform these duties in connection with many others. Particularly in the South, the system is undeveloped. For the second class, institutions are increasingly developed. Almost all the states have provided educational institutions for the blind, as a rule maintenance and tuition being free. All, except Oklahoma, have institutions for the acutely insane, tho in many states the provisions are quite inadequate, many being still in almshouses or jails. Twenty-three states have special institutions for the idiotic and feeble-minded. A few states are now developing institutions for epileptics and consumptives. Eight states have provision for inebriates, now largely looked upon as diseased. In regard to children, their retention in almshouses is now being rapidly given up, Michigan leading in removing them from the almshouses in 1871. Nineteen states, mainly Eastern and Middle states, have well-organized systems of child-saving, mainly placing them out. Michigan and five other states have a state public school for all dependent minors of sound mind and body, from whence they are transferred and placed out in homes, under the guardianship of the State Board of Control.

Private charity in the U. S. is largely developed. Mr. Hagan has estimated that, excluding all national, state, or municipal appropriations, all regular church and missionary expenditures, and all items of less than \$5,000, there was spent in private charities \$29,000,000 in 1893, and \$95,000,000 in 1903. Besides the larger institutions should be included lodging-house associations, existing now in most larger cities; working men's hotels, working girls' clubs, boys' and men's and women's clubs, women's relief corps, nurses' associations, 150 social settlements, legal aid societies, penny provident and savings-banks, dispensaries, libraries, coffee-rooms, children's aid societies, ecclesiastical charities, Protestant and Catholic.

Great Britain.—(See also article *POOR LAWS* [English]). To-day English poor relief is under a central authority, the Local Government Board, under a president, who is a cabinet minister. The board has large powers over the local boards, in issuing general orders, discharging any local officials, and auditing accounts. There are, secondly, 649 poor-law unions, who are unpaid poor-law guardians, elected by the voters of the union, with paid clerk and one or more relieving officers. The local poor rates are now largely supplied by "grants" from county funds. Outdoor relief is forbidden, except under exceptional circumstances. These exceptions tend to grow, especial-

ly in the large cities, but are usually accompanied by an outdoor labor test. In 1900, out of 792,367 receiving relief, 577,122 received outdoor relief. Each union must have at least 1 workhouse, with at least 7 distinct wards, for men, women, children, etc. They are more debt prisons than homes. To-day children are mainly removed and placed in separate schools. Vagrants are committed to "casual wards." In 1900 there were in England 9,400 vagrants. Almost all the urban unions have infirmaries attached. Relief is given to the defective, but blind and deaf-mute children are educated in special schools. For feeble-minded children special schools are also being started, there being 32 such now in London. There are 4 important semipublic institutions for epileptics, the chief being the Chalfont Colony, established by the National Society for the Employment of Epileptics. In 1900 there were 96,865 insane paupers in England; 70,833 were in asylums, 17,460 in workhouses. By 1902 96 county or municipal boroughs had some form of inebriate reformatory for convicted drunkards.

Endowed private charities are very numerous in England, with annual income of many millions of pounds. The Church of England has 74 cottage hospitals and 16 special hospitals. It has 39 convalescent homes, with 26 institutions for training nurses. It has 28 sisterhoods, besides several orders of deaconesses. Connected with it is the "Reformatory and Refuge Union" with 29 reformatory institutions. Its Children's Aid Society aided over 17,000 children up to 1903. Its Society for Providing Homes for Waifs and Strays has 87 homes; it has 73 orphanages, 44 penitentiaries, and 59 temporary refuges for penitent fallen women. The social department of the Church Army has over 100 labor and lodging homes, besides labor registries, food depots, and other agencies; it dealt with 30,000 cases in 1901. The Roman Catholic Church in England has also extensive and varied charities, the most important being the St. Vincent de Paul Society. Other Protestant bodies have less wealth, but in proportion to their wealth have increasing and varied philanthropies. Non-sectarian charities are also abundant. The Dr. Bernardo's homes have 40 institutions, caring for 3,000, besides 3 emigration depots in Canada. There were, in 1902, 29,985 Friendly Societies in England, with a membership of over 11,424,000, and funds of £37,917,702; they are either trade societies or general. The post-office savings-banks, at the end of 1904, had 9,673,717 depositors, and deposits of £148,339,354. Of the depositors, 18 per cent were artisans; 50 per cent women and children. There are also collecting savings-banks: 55 in London.

Australasia.—Considerable outdoor relief is given in Australasia. The sum of indoor and outdoor relief, public and private, in 1900, in the 7 colonies was £1,250,000. There are also many private charities, most of them being aided by the State. There were, in 1898, 3,306 Friendly Societies, with 276,772 members, or 6.24 per cent of the population. There are many ecclesiastical charities, especially Roman Catholic; 11,614 persons were cared for in destitute asylums in one year. There are 278 hospitals. Orphans are mainly provided for by the boarding-out system.

Austria.—Poor-laws differ in different parts of the empire. They were formerly mainly in the care of the Church, but now tend to be trans-

ferred to political officers. No one can claim relief for whom any third party is legally responsible. Recipients are bound to restore the aid when they can. Aid must be limited to that which is necessary for existence, for the care of the sick, and for children. It is usually given in cash. Overseers or visitors (*Armenpfleger*) are not found everywhere. "Certificates of poverty" are required, but abused. In lower Austria the 68 district councils had, in 1904, 1,153 members, with 7,429 overseers (nearly all unpaid), and aided 39,000 persons. In upper Austria the poor commissions are made up of the chief executive of the borough, a priest, and at least three overseers (*Armenwäiter*). In Vienna there are 19 districts, each with a district committee, which elects a board of commissioners (*Armenärthe*). There is also a general poor department and another department for orphans. In 1898 there were 1,799 overseers, mainly unpaid. There are many institutions, partly private, but endowed with public funds. In 1899 there were in Vienna 951 endowments, with a capital of 6,140,939 gulden.

There are many Church institutions: Catholic, Protestant, and several of certain knightly orders. Charity organization is backward. There are 1,643 poorhouses (1900). The municipal "Houses of Maintenance" are better. In 1896 there were 602 hospitals with 39,588 beds, and 16 hospitals for children, with 1,114 beds. There are 200 homes, where children are received. The Vienna foundling asylum is the largest in the world. There are 488 savings-banks. In 1902 there were 1,440 crèches and kindergartens, with 114,674 children and 231 orphanages with 13,707 children; 1,645 poorhouses with 38,331 inmates. The expenditure for poorhouses alone was 8,817,235 crowns; cost per day about 80 pfennige. The Austrian provinces spent (1903) on hospitals, orphanages, poor relief, 6,487,404 cr.; Vienna and other municipalities, 20,716,964 cr.

Belgium.—There is a system of central inspection and a superior council of relief. Under these each commune is responsible for its relief work, the weak communes may combine. *Commissions d'Assistance* are created for each commune, or union of communes, with from five to ten members, among which must be a clergyman, an alderman, and a laborer. No salaries are paid, tho the laborer can be indemnified for time lost. Women are eligible. The indigent are divided into those unable to work, those willing to work but unable to find it, and those unwilling to work. To the first class is given relief, indoor relief for the most part. Private charity in Belgium is very great, providing for at least one half of the indigents, but is controlled by the State. For the other two classes there are workhouses, refuges, and schools of charity. The workhouses are for persons able to work, but who do not. The refuges are intermediary between the workhouses and the poorhouses, for those willing to work, but unable to, through sickness, old age, or disability. Persons found begging can be assigned to these for seven years. In 1901 there were 6,384 in these refuges. The schools of charity are compulsory training-schools for youths up to eighteen, who have become vagrants or have committed misdemeanors. The expense for these institutions is divided equally between the State, province, and commune. Very low wages are paid in the workhouses and refuges.

Charity institutions received (1904) in donations 3,069,345 francs.

Canada.—Strictly speaking, Canada has no poor law, and no "poor rates," but the relief institutions, tho mainly private, are largely supported by municipalities. In the cities large numbers receive outdoor relief, usually with some work test. There are in the dominion 75 hospitals, 18 asylums for the insane, with many other institutions of various kinds, for relief or prevention.

Denmark.—The aged poor of spotless character receive a State pension, and their position is in no way dishonorable; they lose no civil rights and do not come under the poor law. They have an attractive house in Copenhagen, with separate rooms for married couples, reading and smoking rooms, etc.; 500 inmates. The other class are placed in an institution where they may work and receive 6 cents a week above cost of maintenance, which is about 25 cents a week. Those unable to work receive 6 cents as a gift. People stay for life; married couples live together.

France.—The prevailing principle is that all charity shall be administered at home, if possible, and institutional aid given only when imperative. Thrift is a national characteristic. In all communes outside of Paris institutions have administrative bodies distinct from the bureau of charities. In Paris a single body, under the Prefect of the Seine and the Minister of the Interior, directs all indoor and outdoor relief. Funds are supplied from gifts and legacies, a direct tax on all places of amusement, the general State funds, municipal appropriations. Private charities have a large and varied development, and cooperate with the State. The *Société Philanthropique* (founded in 1780) has 30 soup-kitchens, 30 dispensaries, 4 for children; 1 hospital, 3 night refuges, homes for the aged, for mothers, for women enceinte, improved dwellings, etc.; 12,000 children are cared for each year. At its refuges 12,000 women are admitted, and work found for about 25 per cent; 5,000 francs a year are given in rewards to honest and industrious workers. The *Œuvre de Bienfaisance*, founded by Miss de Broen (1871), is notable. The *Œuvre de la Chaussée du Maine*, the *Société Française de Bienfaisance* de Tunis, the *Hospitalité Universelle à Nantes et à Paris* are also important. Ecclesiastical charities are numerous, tho secular institutions are growing. Catholic societies relieved in 1901 107,400 persons, and numbered 4,000 according to Abbé Gayraud. A Protestant society is the *Institution des Diaconesses des Églises Évangéliques de France* (1841). There is no charity organization society, but 15,827 *Bureaux de Bienfaisance*, in the communes, control private societies, and in a way unite them as well as administer outdoor relief. Indoor relief, only given when imperative, is well developed. In 1904 France had 1,826 hospitals for the sick, aged, infirm, or infants, maintained at a cost of 157,158,686 francs. They contained 177,880 beds. Most of them have free dispensaries and many free clinics. There are in Paris 28 *Consultations des Nourissons* and many in the country. Asylums and schools for the blind and deaf-mutes were developed in France earlier than in any other country, and in many similar ways France still leads. The national lunatic asylum at Charenton is a model, and Ainay is a colony for insane men, and at Dun-sur-Auron for insane women. Institutions for dependent children are various. The first crèche was opened at Paris, 1844. *La Maison Maternelle, L'Hôpital des En-*

fanis Malades, Ligue Fraternelle des Enfants de France, L'Œuvre laïque du bon Pasteur are typical. The State has established state savings-banks, pawn-shops, and old-age insurance.

The *Bureaux de Bienfaisance* spent (1904) 46,810,251 francs. The orphanages cost 31,074,890 fr. Free medical assistance was given at a cost of 19,913,225 fr.

Germany.—The care of the poor is a legal obligation. Each German citizen must be relieved from misery by the local union (*Ortsarmenverband*) where he is at the moment; but the cost is charged to the district where he last resided for two years without receiving relief (*Landesarmenverband*). Three systems are in vogue: First, the director of the *Armenverwaltung* (civic relief board), often the mayor, through paid officials, examines and relieves cases; this system is disappearing. Second, the board assigns districts to unpaid assistants, who report to the board, and the board decides. Third, the board puts responsibility on the unpaid honor-officials (*Armenpfleger*) to decide what is the best way of meeting each case. It makes them guardians of the cases, and gives them certain districts to watch and prevent the beginnings of evil and want, when it costs much less than to relieve than when it has grown desperate. This is the famous Elberfeld system to-day spreading through Germany. These guardians cooperate and consult. They report to and consult with the *Vorsteher*, or inspector of different circuits, and these report to and consult with the *Hauptverwaltung*, or central body. It is considered an honor to be a guardian, and all classes are drawn from. Only the chairman of the Central Board usually is paid, except the paid clerks, statisticians, etc. In Hamburg there are 1,600 honor helpers and 100 clerks. The relief is mainly outdoor relief (not in institutions), but it is carefully watched. The guardian can give relief of any kind: money, clothing, food, medical attendance. He must relieve necessity at once; but the main aim is economic independence, by finding work. In some cities women visitors are added. The Catholic Church has many societies, brotherhoods, and sisterhoods, especially the Sisters of Mercy, of Vincent de Paul. The *Charitas Verband für das Katholische Deutschland*, with central office at Freiburg, in Breisgau, seeks to unite these. The great Protestant movement is the Inner Mission (*Innere Mission*), the result of the labor of J. H. Wichern, at the Rauhe Haus, in Hamburg (1848). Its aims are spread of the Gospel, parish work, training of children, saving of youth, rescue of the lost, care of the defective and sick, contest with social evils, and social betterment. The Central Committee is in Berlin. Trained deaconesses and agents largely do the work. It has to-day thousands of hospices, or homes, for work-people; nurseries, "mother schools," for the training of domestics; 450 *Herbergensur Heimath*, or lodging-houses for wanderers (laborers seeking work), workmen's colonies, Magdalene and inebriate asylums, etc., etc.

Great effort is made to coordinate public and private relief. The German Society, *Der Deutsche Verein für Armenpflege und Wohlthätigkeit* (1880), is the National Conference of Charities. In 1885 1,078,921 persons were relieved at home; only 288,476 in institutions. The outdoor relief includes medical aid, with paid physicians, trained nurses, care of households, help of women in confinement, care of convalescents, diet for the

sick, etc. It is estimated that in Germany there are 40,000 blind, mainly in special schools or institutions. In 1900 there were 91 institutions for deaf-mutes. The insane are estimated at 1 to every 300,400 inhabitants, with 47 special institutions. In 1903 35,596 children were given a summer outing.

Hungary.—Relief is quite undeveloped, though recently progress has been made. There are no workhouses, and indoor relief is rare. In 1897 there were 359 hospitals. There were 10,000 communes with no resident physician. There are 105 asylums for orphans and 195 for paupers. In 1897 there were 1,002,369 depositors in savings-banks.

Private charity is extensive, and fairly large sums are given to public institutions by individuals.

India.—Hindus call India "The Land of Charity"; foreigners add "of beggars." The laws of Manu make it the Brahman's duty to beg. There is no poor law. Charity is all private. The government, in time of famine, supplies relief works. In all the principal cities and mission stations Europeans have established Friend in Need Societies or Charity Boards. There are 48 houses for opium refugees. The Lady Dufferin Association has hospitals and dispensaries, lady doctors and medical students. There are probably 500,000 lepers in India; and there are now 47 leper asylums. The largest has 545 inmates. There are 9 asylums and schools for the blind and deaf-mutes, and 23 for the insane; 115 orphanages, and 7 juvenile reformatories. The government is developing large schemes of irrigation, commerce, and industry. It is introducing agricultural banks and postal savings-banks.

Italy.—In each commune there is a Board of Charities, which represents all the interests of the poor in the commune, but leaves them large autonomy. Settlement is acquired by residence without serious interruption for five years. A provincial administrative commission (*giunta*) supervises private institutions, but gives them large autonomy. In 1899 the total sum of funds in *opere pie* (benevolent funds) was over 2,000,000,000 lire. Hospitals have 80,000,000 li.; orphanages, 56,000,000; local charities, 18,000,000; instruction, 2,500,000. In Italy 10,644 brotherhoods have an annual income of 9,400,000 li., from which 1,700,000 goes to administration, 5,000,000 to ceremonies, and 1,700,000 to charities. Provision for the vagrant is inadequate. Hospitals in Italy numbered 1,208 in 1898, including 20 children's hospitals. Schools for the deaf numbered 47 in 1900, and asylums for the insane 128 in 1898. Foundling asylums numbered 113. Begging is forbidden where asylums exist, but the police rarely arrest under this law, and begging is general and persistent, and said to be increasing. The total resources of Italian charity were estimated in 1901 at 150,000,000 li. In 1895 64,700,000 came from provincial or communal subsidies. New legacies for charities from 1880 to 1905 amounted to 415,114,617 li.

Japan has both a central and prefectural system of poor relief. Since 1899 the central fund for relief has been abolished, and the prefectural funds were decreed to have a minimum of 500,000 yen. The deficiency, if any, is made up by the central treasury. In 1904 the prefectures gave relief to the amount of 76,183 yen—shelter, 354; food, 34,826; clothing, 2,363; medicine, 274; provisional dwellings, 22,113; providing work, 15,-

748; miscellaneous, 505. The central government grants relief, however, to the absolutely helpless. In 1904 the total thus expended amounted to 201,398 yen, relieving 18,536 persons. The central government also sustained 2,276 foundlings at the expense of 39,678 yen. Local corporations and private persons have established several workhouses. The famine of 1905 presented extraordinary needs and relief, and the assistance of foreign countries was gladly accepted.

Netherlands.—There are some 7,500 charitable institutions in Holland: 1,200 under civil administration; 3,060 controlled by the churches; 710 for the aged; 712 for the sick. The support of the poor is kept mainly to the churches and private societies, but all must report to the government. In 1903 the number relieved was 177,109, or 3.26 per cent of the population. Of special importance is the Amsterdam society, *Liefdadigheid naas Vermogen* (charity according to means). It covers the whole city in 34 districts, with a superintendent for each. The Society for Public Welfare is also important. The periodical *Tijdschrift voor Armoedezorg* covers the whole field. Mendicity and vagabondage are treated as crimes, and persons so convicted are placed in a State-work establishment. A few communes support workhouses.

New Zealand.—Relief is mainly preventive. The government life-insurance does more than one half the life-insurance business, abstainers being placed in a class apart. The old-age pensions law gives a pension to every person sixty-five years of age who has resided twenty-five years in the colony, who is of good moral character, has been sober for the past five years, and whose accumulated property is not over £270. Payments are made through the Postal Department, the cost of administration being only £2,535. The highest amount per person is £26. In 1906 there were 12,583 pensioners receiving £313,081. There are 1,180 various relief institutions. There are 19 benevolent asylums for indigent persons, with 1,167 inmates. "Tramps" are set to work. Beggars are arrested. The needy are aided by relief boards. There are 4 orphan asylums, but the boarding-out system is largely adopted for needy children. In 1905 there were 2,315 inmates of various asylums of whom 1,104 were over sixty-five years of age. Under the First Offenders' Probation Act, offenders are placed under probation officers. The public trustee takes charge of estates where no will is left and funds left for charity.

Norway.—The communes are obliged to give relief. Settlement is gained only by two years of continuous residence. Differences are settled by the ecclesiastical ministry in the courts. The nearest relative must support where possible. Miners must and industrial regions can establish their own poor districts. Each district has a poor commission consisting of the pastor and persons chosen by the communal council. Any citizen may be required to act as a relieving officer without pay. The sources for relief are endowments, gifts, and a State fund, and repayment of expenditures. Institutions are rare, paupers mainly being boarded out. In 1894 only 2,390 were in poorhouses. Idleness and neglect to support a family are punishable by imprisonment or labor in a workhouse. Pauperism is extensive, but seems to be decreasing; 10,967 received only medical aid. Christiania has built a few blocks of artizan buildings and created a fund to be lent

for the purchase of homes. Factory inspection and protection of laborers in mines and handicrafts exist. Child labor is restricted and education insured. Children under fourteen may not be employed in factories, and youths from fourteen to eighteen not over ten hours. Women may not be employed in mines nor with machinery nor for six weeks after confinement. Adult men may not labor after 6 P.M. before a Sunday or a holiday nor till after ten on a Sunday or a holiday.

Sweden.—The duty of relief lies on the communes. Settlement may be acquired by registration with liability to taxation. The nearest relative must support, so far as possible. There is a superior board of administration. The communal board may create a poor commission with at least three members. The parish pastor has a voice. Ancient endowments and gifts are drawn upon, supplemented by a head tax. Methods of relief are left to the communes. Boarding out of paupers is common. In 1904 Sweden had 1,893 institutions for poor relief and cared for 55,890 persons. Pauperism is on the increase. It has grown steadily since 1860, when 132,982 people were cared for, to 1904, when 234,639 received aid; 78,633 from towns; 214 poor farms shelter vagrants and furnish food in exchange for work. Public relief is given to dependent children under fifteen, controlled by boards of guardians.

Switzerland.—The existence of common lands belonging to the communes, formerly used for the benefit of all, but now only for those not having private lands, is thought by some to increase indolence and pauperism. Relief was formerly limited to those inheriting local citizenship, but is now being changed to be given to those having territorial settlement, the registration for settlement is carefully guarded. The State gives a subsidy of 60 to 70 per cent of what is lacking in a commune. The entire State expenditures for poor relief are estimated at 2,000,000 francs. Institutions are largely supported by the State. Only the cantons of Bern and Neuenberg have a poor-law. Private charities and benevolent societies have considerable development, especially The Swiss Benevolent Society and the Basel Association. In inebriate asylums Switzerland is in advance. In 1895 there were 2,107 blind persons, only 350 in institutions. There are 16 institutions for deaf-mutes. In the care of neglected children Switzerland frankly recognizes that the State must take the parents' place. For workmen in search of work Swiss cantons have followed the models of Germany's stations for help and hospices, with even more agencies under police control.

PAWNBROKING: It is difficult to determine the origin of pawnbroking. References are made to it in the Bible (Genesis concerning Judah and Tamar) and by several Greek and Roman writers. It was generally allied with usury, especially during the Middle Ages, when it was largely in the hands of Jews. It was the predecessor of banking. Its career has been one of oppression, and is so still where the public authorities have not interfered and regulated it.

Private pawn-shops were the first in the field. The business is very profitable, since the broker loans on a security assessed by himself on terms imposed by himself. Frequent charges in American cities have been from 30 to 300 per cent. In some cases—kept from the public—they have been greater. What

Private Pawn- Broking

they may have been during the Middle Ages, when the pawnbroker was often the only man with money, and the need of the borrower great, we may surmise from treatment of the Jewish pawnbrokers and their persecution everywhere.

Religious pawn-shops—monts-de-piété—originated in Italy during the fifteenth century in order to counteract the exorbitant rates of money-lenders and save the poorer classes from ruin. In nearly all Latin Roman Catholic countries these institutions do practically all of the pawnbroking.

The *monts-de-piété* were, however, first developed in Belgium by a priest in 1534 at Ypres with the gift of a small sum of money.

Monts-de- Piété

Bruges followed in 1572; Lille, 1607; Brussels, 1615; Antwerp, 1620. The institution spread rapidly over the provinces and is now doing all the pawnbroking under State supervision. The managing board consists of five persons nominated by the communal council; one of these is a member of the board of charities—Bureau de Bienfaisance—and one of the asylums board—Administration des Hospices. Under the law of 1848 all important matters, e. g., amount and rate of interest, salaries, publication of budgets and accounts, are under the supervision of the communal council. The Constitution provides that profits arising are to be applied—after payment of expenses—successively to the payment of borrowed funds, then to the creation of an endowment, eventually to free loans to indigent persons, and finally to charitable institutions.

The rate of interest charged on loans varies from 4 to 16 per cent per annum. Ghent adds to the minimum of 4 per cent a fixt fee of 2 per cent at receiving and 1 per cent at returning the loan, altho the maximum of either fee is fixt at 1 franc. Brussels charges 6 per cent; Namur, 10 to 16. The loan varies from one half to three fourths of the value of the pledge. The officers are all under heavy bonds—director, 40,000 fr.; secretary, 20,000; cashier, 10,000.

Business transacted in 1895 for Belgium was: *articles pawned*, 891,756; amount loaned, \$2,135,378; average loan, \$2.39; *articles redeemed*, 845,617; amount loaned, \$2,061,824; average, \$2.44; *articles sold*, 37,795; amount loaned, \$100,256; average, \$2.35. The net profit of the *monts-de-piété* for Belgium was: in 1889, \$21,204.91; 1890, \$21,776.96; 1895, only \$12,477.84. Private pawnbroking is prohibited.

France has developed the system of the *monts-de-piété* on lines almost identical with those of Belgium. The only notable exception is that the mayor of the town is ex-officio president of the society—a fact indicative of the close supervision of these institutions by the State and municipalities. The reselling of pawn-tickets is prohibited. Stocks and bonds may be pledged for loans.

In Italy pawnbroking is carried on along the lines of the *monti-di-piété* under State supervision. There were 555 institutions in 1896 with a net capital of 71,986,698 lire; some of the

larger institutions are banks. In Milan the rate of interest is 5 per cent on loans below 10 li.; above, 6 per cent plus 5 per cent for marking, and 2 per cent for storage. In 1896 387,132 articles were pledged for 7,988,369 li. Rome's bank of *monti-di-piété* had (1898) a capital of 3,549,535 li.; loaned 15,000,533 li. on 1,066,146 articles at 4 to 7 per cent. It has 15 branches. The interest in Bologna is 7 per cent; the fund 1,041,051 li.; in 1896 2,389,567 li. were loaned on 208,040 articles.

In Spain the institution is connected with the savings-banks. The pawn-shop advances money at 6 per cent; the savings-bank charges the pawn-shop 5 per cent on money advanced, and pays its depositors 4 per cent. Thus both the bank and the pawn-shop make 1 per cent—sufficient for expenses and a small profit for the increase of capital.

State and Municipal Pawn-shops.—In Germany pawnbroking is conducted by the State, by the *Gemeinde* (parish), or by private persons under State supervision. The Berlin *Königliches Leihamt* is under the protection of the German Reichsbank, which advanced the necessary funds.

The pawn-shop usually advances on two thirds of the estimated value of household goods, four fifths on silver, and five sixths on gold. During the year 1893 the sum of \$1,200,000 was lent on about 220,000 pledges. After payment of all administrative expenses and interest on capital, there remained a net surplus of over \$10,000, which was placed to the account of the reserve fund, and of which the interest is devoted to a charitable institution. Under the State system the interest on loans is 12 per cent, while under private management it is either 12 or 24 per cent, according to the amount of the loan. Under both systems the loan is contracted for six months; under the first, six months' grace is allowed, while under the second four weeks only. The State pawn-office is used by the middle rather than by the very poorest classes. Artizans and tradesmen head the list, widows and unmarried women follow, while day-laborers and factory workmen occupy the third place.

In Austria-Hungary there exists a system of *Versatsämter*, usually under the control of the municipalities, but more or less under the control of the State also. The prototype of them all is the so-called Imperial Pawn-office of Vienna, founded like any other charitable institution and intended solely as such. The Minister of the Interior nominates the officials and sanctions any important matter connected with the management. The original advances have now been paid off; the Imperial Pawn-office is entirely independent, and is annually adding to its cash capital from its own profits. The interest charged is at the uniform rate of 10 per cent. In 1893 the Vienna office received over 860,000 articles, for which it advanced \$2,100,000.

In Holland the State authorized (1826) the creation of pawn-banks (*banken van leening*) under municipal control; the head of the local government is president of the institution, and appoints the directors and officers. The interest varies from 5 to 15 per cent, according to locality, article pledged, and length of loan. A private pawnbroker enjoys the greatest freedom. The law ignores him, and he is thus able to transact his business on his own terms. He frequently buys the tickets issued by the municipal shops, and

thus gets the benefit of the surplus and profit of these institutions, or resells the tickets at an advance. In 1895 the business of the bank at Amsterdam was: Total capital, \$298,908; borrowed capital, \$193,563; surplus, \$6,028; other credits, \$6,588; profits, \$3,528. It loaned \$906,913 on 762,246 articles at rates of 5 to 12 per cent. The total for Holland was: \$2,294,937 loaned on 2,126,245 articles; average loan, \$1.08; articles redeemed, 2,088,531 for \$2,256,204; articles sold, 65,921 with loans of \$64,549; amount outstanding, \$853,616.

England has no municipal pawn-shops, notwithstanding a strong agitation along this line. Private pawn-shops must be licensed, and charge $\frac{1}{2}$ d. for the ticket on loans below 10s., and 1d. above. Interest at the rate of $\frac{1}{2}$ d. per month on loans under 10s., and 1d. from 10s. to 40s. On sums above a special limit, pawn contracts may be made on terms agreeable to the two parties.

In the United States all the states have laws regulating pawnbroking. Licenses are required

as a rule, and the maximum rate of permitted interest varies from 24 to 120 per cent per annum. There

are no municipal shops, but a number of incorporated institutions trans-

act business along these lines. The *Collateral*

Loan Company of Boston was organized 1859,

with a paid-up capital of \$300,000. It charged 1.5 per cent monthly, raised it to 3 per cent, and

lowered it later to 1.25. Business in 1861 was:

Loans, 7,593; amount, \$226,508; average loan, \$29.83; average interest per loan, \$1.89. The cor-

responding figures for 1897 were: 52,065; \$818,816; \$15.73; \$1.22. *St. Bartholomew's Loan*

Association of New York was established by parish-

ioners of St. Bartholomew's P. E. Church in 1894, under the rectorship of Dr. D. H. Greer.

Capital: \$40,275; rate of interest, 1.5 per month.

Business in 1896: Loans, 693 for \$38,968; average loan, \$56. In 1906: Receipts, \$100,704; loans,

923 to 955 people; average loan, \$91.12; gross earnings, \$10,000. The society just mentioned

awakened a wide interest in loans to the poor with the result that in 1894 (May 21st) the *Provi-*

dent Loan Association of New York was incor-

porated—a society which has become the model of numerous other organizations in cities all over

the U. S. Its capital is \$100,000; interest has been lowered from 1.5 per cent per month to 1 per cent;

it pays dividends of 6 per cent. Business in 1894—

one office: Number of loans, 14,234; amount, \$229,155.50; pledges redeemed, 5,575; amount,

\$84,174.50; interest earned on loans, \$7,566.27; expenses and losses, \$15,579.22; net earnings, \$15,579.59; interest on funds employed, \$11,269.65;

surplus, \$4,309.94. Corresponding figures for 1906—in five offices—are: 240,321; \$9,612,430;

224,159; \$8,603,659; \$443,389.77; \$104,917.45;

338,472.32; \$172,040.84; \$166,431.48.

The advisability of taking pawnbroking out of the hands of private individuals will appear from this fact: A loan of 65 cents for one week paid interest per annum, in 1894, as follows: Paris, 0;

Madrid, 6; Brussels, 7; Berlin, 12; London, 260. It has been proved, moreover, that small shops are not profitable, even at the rate of 100 per cent per annum, while large ones pay good dividends at from 5 to 10 per cent.

RUDOLPH M. BINDER.

PAYMENT OF MEMBERS: In Great Britain at present the members of Parliament receive no salary. This has worked, until recently, to prevent working men and others without income from entering the political arena. Recently this has been in part obviated by the Labor Party, which collects from each labor organization belonging to it, on the basis of two pence for each member of the organization, thus paying to its representatives in Parliament a small salary. (See LABOR PARTY.)

But Labor and Radicals in England have long demanded the payment of a salary, and to-day the demand for it is general. The following table prepared by Sir Edwin Grey is from *The Reformer's Year Book* (1907):

| COUNTRY | Salary | Other advantages |
|---------------|---|---|
| Austria..... | 16s. 8d. a day during session. | Traveling allowances. |
| Hungary..... | £200. | £66 house rent. Reduced railway fares. Free railway travel. |
| Bavaria..... | 10s. a day during session. | Free railway travel. One free journey. |
| Belgium..... | £160. | Free railway travel. One free journey. |
| Bulgaria..... | 10s. a day during session. | Free railway travel. |
| Denmark.... | 11s. a day during session (reduced to 6s. 8d. if more than six months). | Free travel on State railways. Nominal fee of 8s. per month on private lines. |
| France..... | £360. | Free railway passes. Free railway travel. |
| Germany.... | £150. | Free travel. Free railway passes. Free railway travel. |
| Prussia..... | 15s. a day during session. | Free travel. Free railway travel. |
| Greece..... | £72. | Free travel. Free railway travel. |
| Italy..... | None. | One free journey. Medical attendance. Funeral expenses. |
| Netherlands.. | £166. | Free railway travel. Free travel. |
| Norway..... | 13s. a day during session. | One free journey. Medical attendance. Funeral expenses. |
| Portugal.... | None. | Free railway travel. Free travel. |
| Rumania.... | 20s. a day during session. | One free journey. |
| Russia..... | 11s. a day during session. | One free journey. |
| Servia..... | 12s. a day during session. | One free journey. |
| Spain..... | None. | Cheap railway tickets. One free journey. |
| Sweden..... | £66. | One free journey. |
| Switzerland.. | 16s. a day during session. | One free journey. |
| United States | £1,000. | £25 for stationery. One free journey. Free postage, free seed for distribution. |

As a general rule members of the upper houses are not paid, but notable exceptions are France, Russia, and the United States. Senators in France and the U. S. are on exactly the same footing in this matter as the deputies or congressmen, while in Russia a seat in the Upper House carries with it a salary of £2.12s. 9d. a day, or more than double the sum received by a member of the Duma.

PEABODY, GEORGE: Merchant; philanthropist; born South Danvers, Mass., 1795; received little education, and entered a store as clerk at an early age. In 1814 he began a dry-goods business in Georgetown, D. C., as partner with Elisha Riggs. He later had establishments in Baltimore, New York, and Philadelphia. In 1829 Peabody became head of the firm; in 1837 he removed to England; in 1843 he withdrew from the old firm of Peabody, Riggs & Co., and established a banking-house. He became very rich, and gave away large sums of money. His

gifts, in all, amounted to about \$7,000,000. The freedom of the City of London was given to him, and his statue placed in the Royal Exchange in 1869. He died in London, Nov. 4, 1869.

One of the chief benefactions of George Peabody was the gift of \$2,500,000 to provide dwellings and lodging-houses for the poor of London. Of this \$350,000 was given during his life, and £150,000 in 1873 by bequest. The fund was in the form of a trust, and is in care of a secretary and six trustees, one of whom is the United States Minister to England. Their annual report for 1890 is an interesting document and proves beyond question the wisdom of Mr. Peabody and the value of a good gift wisely bestowed. The fund which in 1873 was £500,000 has grown by the addition of rents and interest to a total of £1,023,446. The land and buildings under the care of the trust are valued at £1,233,845. Up to the end of the year there had been furnished to the artisan and laboring poor of London 5,071 dwellings, 75 having four rooms, 1,789 three rooms, 2,401 two rooms, and 806 one room. The average rent of each dwelling was 4s. 9d. per week, and of each room 2s. 13d.; the rent in all cases including the free use of water, laundries, sculleries, and bath-rooms. The highest rent charged is 7s. 6d. for some of the four-room dwellings. The dwellings are not in a group, but are scattered over the city, apparently being placed where they will do the most good. That the plan of cheap dwellings contributes to the health as well as to the comfort of the poor appears from a glance at the vital statistics. The death-rate in 1889 was 21.15 per 1,000, or .85 per 1,000 above the average for all London, but this was exceptional, the cause being an epidemic which last spring visited the sections where some of the dwellings are located. The infant mortality was 141.22 per 1,000, or 21.37 below that of all London. The births were 38.49 per 1,000; 9.41 above the London record. The trustees' report also gives the employment of each tenant, and the list covers nearly 100 trades and occupations from expert artisans to unskilled laborers.

PEACE CONFERENCE, THE HAGUE: A conference called by the Czar Nicholas II. of Russia for the consideration of means and measures by which wars might be avoided, and peace promoted. All civilized nations were invited to send delegates. One hundred delegates met, May 18, 1899, and held a number of sessions between that date and July 29th. The net results of the deliberations were: (1) The prohibition of the use of projectiles or explosives from balloons for five years; (2) the prohibition to employ projectiles which diffuse suffocating gases dangerous to life; (3) the prohibition to employ dum-dum bullets which expand or flatten in the human body. The conference also passed six resolutions, of which the most important was that relating to international arbitration, and which made a deep impression on the civilized world. A permanent Court of Arbitration was created, which has settled a number of disputes amicably; the first of these was that between the United States and Mexico concerning the Pius Fund Claims, in 1902.

The moral effect of the first peace conference at The Hague was so great that a second conference was called for June 1, 1907, by Queen Wilhelmina at the initiative of the czar. The sessions began June 15th, with a much larger attendance of delegates and a more favorable and appreciative public all over the civilized world. The conference was in session for eighteen weeks, and the net results were embodied in the following conventions adopted unanimously:

1. The peaceful regulation of international conflicts.
2. Providing for an international prize court.
3. Regulating the rights and duties of neutrals on land.
4. Regulating the rights and duties of neutrals at sea.
5. Covering the laying of submarine mines.
6. The bombardment of towns from the sea.
7. The matter of the collection of contractual debts.
8. The transformation of merchantmen into warships.
9. The treatment of captured crews.
10. The inviolability of fishing-boats.
11. The inviolability of the postal service.
12. The application of the Geneva convention and the Red Cross to sea warfare, and
13. The law and customs regulating land warfare.

"The right to sign these conventions will be open until June 30, 1908."

In addition the conference has made declarations and adopted resolutions as follows:

First. That balloons shall not be used for the throwing of explosives.

Second. A recommendation in favor of obligatory arbitration.

Third. A recommendation regarding the establishment of a permanent court of arbitration.

Fourth. A resolution concerning the limitation of armaments.

Fifth. The convocation of the third conference.

Sixth. The prohibition of unnecessarily cruel bullets in warfare.

Seventh. The cooperation of all countries in the building of the Palace of Peace.

The third conference is to meet in 1915 by resolution adopted in the last session.

PEACE SOCIETY, THE: Founded in London in 1816, it has, therefore, been at work ninety years; and its history and results are largely seen in the position of the great question of peace to-day. (See INTERNATIONAL ARBITRATION; PEACE CONFERENCE AT THE HAGUE.) The society thus sets forth its objects:

1. To promote to the utmost of its ability permanent and universal peace throughout the world.
2. To diffuse information tending to show that war is inconsistent with the spirit of Christianity and the true interests of mankind.
3. To indicate the manner in which Christian principles may be reduced to practise in the relations of states.
4. To advocate the adoption of practical methods of settling international disputes without recourse to arms, such as international arbitration, a High Court of Nations, a proportionate and simultaneous reduction of armaments, etc.
5. To oppose the increasing tendency to militarism, which is so fatal to national prosperity and progress.
6. To advocate a reduction of ruinous war expenditures, and thus to lessen the burden which oppresses the peoples of Europe, and especially the working classes.
7. To promote the study of these and similar questions likely to assist in the formation of a healthy public opinion.

The president of the Peace Society is Robert Spence Watson, LL.D.; the secretary, W. Evans Darby, LL.D. The Society publishes monthly *The Herald of Peace and International Arbitration*. Secretary's address: 47 New Broad Street, London, England.

PEACOCK, SIR ALEXANDER JAMES: Sometime Premier of Victoria; born at Creswick, Victoria, June 11, 1861. Member of legislature since 1889; minister without portfolio, 1890-92; Minister of Public Instruction and sometime Postmaster-General, 1892-93. Chief secretary and Minister of Public Instruction, 1894-99; chief secretary and Minister of Labor, 1901-2. Premier Feb., 1901-June, 1902; member for Victoria of National Convention which framed the Commonwealth Constitution, 1897-98. Prominently identified with Australian Native Association movement and several times president of the board of directors. Was grand master of the Grand Lodge of Freemasons of Victoria, 1900-5. Address: 339 Collins Street, Melbourne, Creswick, Victoria.

PEASANT REVOLT (1377-81): An uprising of the English peasantry under the leadership of Wat Tyler (*q. v.*), Jack Straw, and the priest John Ball (*q. v.*). The immediate cause of the revolt was the imposition of an unjust poll-tax, which was to be exacted equally from the poorest as well as the richest; but many other influences had prepared the way for an outbreak. The teachings of John Wyclif and his "poor priests" had very largely emancipated the minds of the laboring

classes from the unjust authority of Church and king. John Ball (*q. v.*), called by the rich "the mad priest," had for years been circulating his leveling doctrine: "When Adam delved, and Eve span, who was then the gentleman?" In 1348 the Black Death had swept over England, carrying off more than half its population, and being especially severe among the poorer classes. As a result there was great scarcity of laborers, and for the first time they found themselves masters of the situation. The demand for workers was twice as large as the supply, and they soon began to reap the benefits of this condition of things. The villeins suddenly became conscious of their strength, and even dared to oppose their masters. The lords and landowners, then as now, at once called for the aid of the law, and enacted what is known as "The Statute of Laborers." This provided that no laboring man or woman, whether bond or free, should leave the parish in which he or she lived, and should receive the same wages as before the Black Death. All the lawyers in the country were set to work undoing the movement of emancipation which had been in progress before the plague. It was found impossible to enforce the Statute of Laborers, for men were at this time too scarce and valuable to be put to death or imprisoned, and too poor to pay the fines levied upon them. However, oppression followed oppression until the poll-tax, in 1377, forced the exasperated peasantry to arms (June, 1381). The revolt spread like wild-fire over the country, and for a time the peasants carried everything before them, burning the records of their serfdom, and killing every lawyer who fell into their hands. The poorer artisans of London opened to them the gates of that city. They destroyed the palace of John of Gaunt and the houses of the wealthy; they burst into the Tower and beheaded the Bishop of Canterbury, but abstained from plunder, calling themselves "seekers of truth and justice, not thieves or robbers." They were finally met by the boy king, Richard II., who promised to free them and their lands forever, and called himself their leader. They believed his promises and gradually dispersed, the assassination of their leader, Tyler, seeming to deprive them of unity and decision. The king then gathered a large army and marched through the land, ruthlessly executing hundreds of the working people and their leaders, and declaring his promises null and void. In this he was supported by the Parliament, which was composed of landowners. The peasants' revolt was, nevertheless, not a failure. It created a healthy respect and fear for the might of united and indignant serfs, and struck feudalism its death-blow. During the century and a half after the revolt, villeinage died out so rapidly that it soon became a rare and antiquated thing. Sixty years after a workingman's wages commanded twice the amount of the necessities of life which could have been obtained under Edward III.; while one hundred years after came what is usually called the "Golden Age" of English labor.

PEASANTS' WAR, THE: The name usually given to the revolutionary uprising of the peasants of southern and central Germany in 1525. The miserable condition of the German serfs,

the appropriation of the common pasture lands by the lords, the refusal of the lords to let their tenants fish in the streams or hunt in the woods, the increase of ground-rent, of socage service, and of tithes, had led to small uprisings in Germany, all through the later Middle Ages. The *Bundschuh* (the shoe), which had been universally adopted as the symbol of these uprisings, had become known through all Germany; yet the revolts had been weak and easily put down. When, however, the Reformation gave the people a new impetus and a new hope, the peasants thought that now was their opportunity. They even at first looked to Luther to lead them. They pleaded the communistic practices and principles of early Christianity. The peasants rose with religious zeal. The twelve principles they formulated show this. They were: (1) The right of the peasantry to appoint their own preachers, who were to be allowed to preach the word of God from the Bible. (2) That the dues paid by the peasantry were to be abolished, with the exception of the tithes ordained by God for the maintenance of the clergy, the surplus of which was to be applied to general purposes, and to the maintenance of the poor. (3) The abolition of vassalage as iniquitous. (4) The right of hunting, fishing, and fowling. (5) That of cutting wood in the forests. (6) The modification of socage and average service. (7) That the peasant should be guaranteed protection from the caprice of his lord by a fixt agreement. (8) The modification of the rent upon feudal lands by which a part of the profit should be secured to the occupant. (9) The administration of justice according to the ancient laws, not according to the new statutes and to caprice. (10) The restoration of communal property illegally seized. (11) The abolition of dues on the death of the serf, by which the widows and orphans were deprived of their right. (12) The acceptance of the aforesaid articles, or their refutation as contrary to the Scriptures. Karlstadt and some of the Reformers joined the peasants. Luther, Melancthon, and others denounced them. Münzer accused Luther "of deserting the cause of liberty and of rendering the Reformation a fresh advantage for the princes, a fresh means of tyranny." The uprising began in Upper Swabia in the autumn of 1524, and gradually spread. When the convent of Kempten was captured by the peasants, Jan. 1, 1525, the uprising became general from the Alps to the Hartz, and from the Rhine to Bohemia. With the exception of Thomas Münzer (*q. v.*) and Götz von Berlichingen, a notorious robber knight, the peasants had no leaders. They simply gathered in large masses of from 8,000 to 30,000 men. They captured and plundered castles and monasteries, often with great cruelty. As soon, however, as they met disciplined armies, in the south under Truchsess von Waldburg, and in the north under Philip of Hesse, they were defeated. The peasants captured Waldburg, but could not hold it. The insurrection of Münzer, the prophet of the Anabaptists (*q. v.*) in Thuringia, broke out later in 1525, but in a few months all was over. The peasants were put down and punished with terrible cruelty. The whole country became one scene of devastation; even young children were cast "as Lutheran dogs" to the flames.

PEASE, EDWARD R.: Socialist; general secretary of Fabian Society; born at Bristol, England, 1857; his education was conducted by a private tutor. Intended by his parents for a commercial occupation, he became a stock-broker in London; but led by the study of social conditions and principles, gave up this position in 1886, and became an apprentice to the cabinet-making trade in a cooperative company, spending his spare time in studying labor questions, economics, and socialism. In 1883 he was one of the most active in organizing the Fabian Society (*q. v.*), the first meetings being held in his rooms, and in 1886 he became for a time its secretary. He traveled later in the United States, returned to England, and became a member of the Alliance Cabinet-makers' Trade-Union, secretary of the National Labor Federation, and a most active worker in labor organization and reform. In 1890 Mr. Pease became paid secretary of the Fabian Society, and has remained so till the present. The work of the society had become so extensive as to oblige him to devote all his time to its interests. Besides his secretaryship he is editor of the *Fabian News*. Both he and his wife, Marjory Davidson, were active members of the Society of the Friends of Russian Freedom. He took part in founding the Labor Party (*q. v.*) and has been a member of its executive and a trustee of its parliamentary fund from the beginning; he was also a founder and governor of the London School of Economics, now a part of the London University, and of an associated body, the British Library of Political Science. He is author of "The Case for the Municipal Drink Trade." Address: 3 Clements Inn, Strand, London, England.

PEFFER, WILLIAM ALFRED: Ex-United States senator from Kansas; one of the leaders of the Populist Party (*q. v.*); born in Cumberland County, Pa., 1831; removed to Indiana 1853, and engaged in farming; enlisted in the war 1862-65; began law practise in June, 1865; removed to Kansas and established local journals; elected to State Senate 1874; editor of the *Kansas Farmer*, 1881; elected to U. S. Senate as Populist, defeating Senator Ingalls, 1891-97; Prohibition candidate for governor, 1898; since then mainly engaged in literary work. Author, among other works, of "Rise and Fall of Populism in the U. S." (1900). Address: Topeka, Kan.

PENOLGY (for statistics see **CRIME**): Etymologically the word penology means the science of punishment; but it has gradually come to have a broader meaning as representing the body of principles and practises relating to the repression and prevention of crime and the treatment of the offender. It includes in its scope the study of social conditions which foster crime, the structure and administration of criminal law, the police power, the study of the offender, both as to environment and heredity; it relates also to the treatment, discipline, and correction of offenders with or without imprisonment and to measures for the rehabilitation in society of the discharged prisoner.

The history of penology is a history of the legal codes or standards written or unwritten which society from the most primitive times has prescribed for social regulation, and a history of the methods of punishments by which they were enforced. Many of these codes and punishments

are now obsolete; but the traditions of retributive justice and of social vengeance which the early codes represented are still embodied in penal theories and practise. In the writings of Plato, in the teachings of Jesus, a principle is enunciated which has become fundamental in the new penology, namely, that, combined with the protection of society, the fundamental object of law, all punishment should be disciplinary and corrective. The Emperor Julian and Pope Clement XI. were also heralds of the new order.

But its two most prominent apostles whose work and influence mark most distinctly the difference between the old conception and the new were Beccaria (born 1738), an Italian nobleman, and John Howard, an English squire, born in 1726. Beccaria's work on "Dei Delitti e delle Pene" ("Crimes and Punishments") was first published in 1764, when the author was but twenty-six years of age. Translated into nearly all European languages its influence was felt throughout the civilized world. Frederick the Great had already abolished torture and it had been discontinued in Sweden; but to Beccaria is due the chief credit of its general abolition in Europe. John Howard, though twelve years older than Beccaria, began his special work nine years later. He had already had personal experience of the barbarities suffered by prisoners of war and had raised his voice against them. In 1773 he was made high sheriff of the County of Bedford in England. The abuse of the fee system and the wretched condition of Bedford Jail led him to inspect other English jails. His observations were extended over the Continent of Europe and embodied in a work entitled "The State of the Prisons in England and Wales, with Preliminary Observations; and an Account of Some Foreign Prisons." This work stirred up great interest and sympathy, and gave an initial impulse to the work of prison reform which was strengthened by the subsequent labors of Howard. Another distinguished prison reformer was Elizabeth Fry, born 1780 near Norwich, England. Her prison visiting, beginning at Newgate, extended to the Continent.

The work of Howard and Elizabeth Fry stimulated effort in two directions: it aroused public sentiment to the necessity of an improvement of the physical and moral conditions in prisons; it developed increased interest in the discharged prisoner. Their writings show, however, that they had a firm grasp of what are now recognized to be fundamental principles of penology. They also stimulated an organic movement which led to the organization of prisoners' aid societies in Great Britain and this country.

What may be called the more scientific stage of penology, due both to the work of eminent theorists and practical exponents of enlightened prison administration, came later. A leader of reform on the Continent was Vilain XIV. of Flanders, whose influence Howard recognized. In Great Britain the man who initiated the most distinct departure in prison administration and whose work was founded on a philosophic conception of penological principles was Captain Alexander Maconochie, a British naval captain of Scotch birth. He had a genius for managing men. His various writings show that he was abreast of the best modern thought as to the application of reformatory influences and methods. He had a limited opportunity to apply his id-

at Norfolk Island, one of the South Pacific islands, 900 miles east of New Zealand, where he had command of a colony of 1,400 men from 1840-44, achieving remarkable success. Sir Walter Crofton, a man gifted with similar genius, applied with great success reformatory ideas to the Irish prison system. In the United States the acknowledged leader in what is known as the reformatory system is Mr. Z. R. Brockway, whose experiments in Michigan at the Detroit House of Correction were afterward fully developed at the Elmira Reformatory, New York.

Distinguished among the leaders and exponents of penology in this country have been Edward Livingston, Dr. E. C. Wines and his son Dr. F. H. Wines, General R. Brinkerhoff, Charlton T. Lewis, Charles Dudley Warner, Charles R. Henderson, and others. Notable leaders in Europe were Montesinos in Spain, Count Sollohub in Russia, Mittermaier in Germany, Dr. Guillaume in Switzerland, Demetz and Bérenger in France, Wichern in Hamburg, Ducpétiaux in Belgium.

The first international prison congress was held in Frankfurt in 1845, and a second was held at Brussels the following year. It was due, how-

Organic Movement ever, to the zeal of Dr. E. C. Wines that the International Prison Congress was reorganized and established on a permanent basis in 1870. Authorized by a resolution of Congress of the U. S., Dr. Wines visited Great Britain and the most prominent countries of Europe, and secured the cooperation of foreign governments and experts. Under his presidency a congress was held in London in 1872; a second convened at Stockholm in 1878. Subsequent congresses at intervals of five years have been held at Rome, St. Petersburg, Paris, Brussels, and Budapest. The eighth congress will be held in Washington in 1910. These congresses have brought together eminent jurists, prison directors, prison physicians, and representatives of child-saving work and of societies for aiding discharged prisoners. The National Prison Association of the U. S. held its first meeting in 1870, and in 1883 was reorganized and has since held annual meetings.

La Société Générale des Prisons of France was organized in June, 1877, and has had great influence on the development of penological ideas in Europe.

The International Society for Criminal Anthropology has occupied a more limited field, confining itself mainly to the study of the criminal; and there is also an international society for the study of criminal law. These organizations, state, national, and international, concerned with the problems of law, anthropology, prison science, and the prevention of crime, have broadened their studies so as to cover the wide field of sociological investigation.

A crime in its simplest definition is an offense against public law to which a penalty is attached. The offense must be defined by law and the penalty affixed. Offenses in most countries are divided into felonies, misdemeanors, and infractions of local or police ordinances. The terms felony and misdemeanor no longer have their original force in Great Britain and the U. S. Originally a felony denoted offenses the penalty of which involved forfeiture of goods; this meaning of the word has long since disappeared. The distinction now between these words lies not so much in the nature of the of-

fense as in the punishment imposed. In most of the codes of the U. S. a felony is a public offense which may be punished by death or imprisonment in the penitentiary; all other offenses are misdemeanors. So far as the duration of the punishment is concerned the sentence for a misdemeanor may last longer than that for a felony. It was formerly assumed that a sentence to a penitentiary or state prison was a much severer punishment than a sentence to a county jail. This is no longer true. A sentence to a first-class penitentiary, so far as the real welfare of the prisoner is concerned, is a much milder punishment than a sentence to many county jails for the same length of time. Offenses are likewise grouped differently in different states. Variations in penalties for the same offenses in different states are very great. From time to time penalties rise and fall like the variations of the thermometer. A study of criminal codes shows that there is no general principle upon which they are established; both with reference to the classification of crime and the penalties attached they are a maze of contradictions. They serve to show, however, to some extent the categories of offenses which are now considered dangerous to society. Many offenses which were crimes in the Middle Ages, such as witchcraft and heresy, are obsolete. On the other hand our statutes teem with offenses to-day of which the ancient or medieval world was entirely ignorant. They grow out of the complexity of our civilization. Such offenses as the stealing of electricity for use as light or power, or the tapping of a telegraph-wire to get information, or violations of the sanitary code as to expectionation, are purely modern. The enactment of laws creating new offenses before people have been educated up to the new standard of civilization involved, leads to violations of law by many people who must be regarded as of average normality. Such offenders cannot be reduced to a purely criminal type; their offenses may result merely from ignorance or lack of development.

A capital defect of all of our criminal codes is in the wholly arbitrary character of the penalties imposed. They are supposed to be deterrent and exemplary, but it is impossible to measure the deterrent force of penalties. As a matter of fact our codes still embody the retaliatory principle of imposing so much suffering for a given offense. The remedy for these arbitrary penalties is in the indeterminate sentence, the principle of which is explained later on.

Ancient codes imposed the same penalties on all offenders alike. The punishment was fitted to the offense, not to the offender. In modern

Study of the Criminal times criminal procedure and the application of penalties have been modified by a study of the offender. According to the code of New York a child under seven years of age is not considered capable of committing crime. A child between the ages of seven and twelve is presumed to be incapable of crime; but the presumption may be removed by proof that he has sufficient capacity to understand the act or neglect charged against him. The dividing line between legal minority and legal majority in New York and in most states is sixteen years of age. Persons who are idiotic, imbecile, lunatic, or insane are likewise excluded from punishment. The distinctions thus made in the law open the way for more minute study of the offender.

Gall and Spurzheim, the founders of phrenology, gave an impulse to the cranial study of criminals, and the studies of Lombroso, Ferri, and others have widened the field of their observation. Broca founded the Anthropological Society in Paris in 1859, and has been regarded as the founder of the modern school of criminal anthropology. Under Lombroso, Ferri, and Garofalo, Italy has since taken the lead in this matter. Lombroso's conclusions, however, are contradicted by French and German anthropologists, and have not as yet been productive of any practical results in criminal procedure or the treatment of offenders. More fruitful results may be expected from the application of psychology to the study of offenders when this new science shall have become more fully developed. It is not possible as yet to distinguish between the accidental offender and the born criminal merely by physiological or anthropological tests. The existence of a purely criminal class has as yet not been demonstrated; but beyond doubt a great many confirmed criminals belong to a degenerate or undeveloped class. The best work done by the criminal anthropologist is in insisting on the importance of the study of the offender because it throws light upon the conditions which produce him and upon the influences necessary for correction.

Criminal Anthropology

Theories of responsibility, partly metaphysical and partly theological, influence criminal law and penalty and the treatment of the offender. The necessity of inflicting punishment, in order that the prisoner may expiate his offense by a certain amount of suffering, is still maintained by conservative writers. Others justify punishment only as deterrent and exemplary. The newer penologists, while ascribing some deterrent value to the infliction of penalties, consider the prime office of punishment to be the protection of society and the correction of the offender. These are fundamental principles of the new penology. With the question of retribution under this view society has nothing to do; and punishment is replaced by discipline.

Responsible

The question of responsibility or limited responsibility in cases of alleged insanity has become prominent in celebrated criminal cases in the U. S. The code of New York follows the English law based on the McNaughton case, and does not excuse from criminal liability any person who knew the nature and quality of the act he was doing and knew that the act was wrong. This definition does not cover acts of paranoiacs who know what they are doing, but are impelled by irresistible delusions, and does not protect society against dangerous cranks. There is need of a more elastic and effective criminal procedure, not in the interest of setting the dangerous crank at liberty, but for the better protection of society by placing him under control.

Modern penology devotes much attention to the causes and prevention of crime. Instead of focusing attention wholly on the responsibility of the offender to society, it is necessary to consider the responsibility of society to the offender. The influence of heredity and environment are important factors. Bearing on this subject, the study of the Jukes family by Dugdale is an excellent illustration of effective sociological investigation. Lombroso and Ferri

Causes of Crime

and Quetelet maintain that crime is likewise influenced by climate and temperature. Among the recognized causes of crime are war, financial depression, broken family ties, vagrancy, intemperance, bad homes, insufficient number of schools, and child labor. Among preventive agencies are education, civic improvement, recreation centers, parks, playgrounds, the drama, kindergartens, boys' clubs, live churches, manual training, and an efficient police. Of all causes of crime, alcoholism is the most frequent, and as yet the problem of the effective legal treatment of drunkenness has not been solved. The only radical cure is the reduction of intemperance by education.

Probation.—Under ancient systems of punishment imprisonment was but little used. The imposition of fines, mutilation, and death took its place. Imprisonment as a penalty is an essentially modern practise. A notable departure from it has been made in suspending the sentence and giving the offender another opportunity without imprisonment. This system was first developed in the State of Massachusetts, where it began to be applied in 1878. It is now a recognized part of the judicial system of that state and has an extensive application to adults. A probation officer, whose salary is paid by the state, is authorized in every criminal court. In the form of a suspended sentence and without the important feature of investigation and surveillance secured through the probation officer, France and Belgium have adopted the system. In France in 1905 39,000 cases were placed under suspended sentence. Statistics for a number of years show that less than 4 per cent default. In England excellent results have been obtained from the First Offenders Act, and efforts have been made to introduce probation officers. New York and other American states have followed the example of Massachusetts. Probation saves the state the cost of imprisoning the offender and leaves him free to work for himself and family. In cases where fines are imposed they may under the probation system be paid in instalments to the probation officer. Restitution in cases of petit larceny by returning the value of the article stolen is also obtained through probation.

Juvenile Courts.—Another important contribution to modern penology made by the U. S. is the development of children's courts. Starting in Chicago in 1899 it has sprung up in city after city and state after state, and has been introduced in England, France, and Switzerland, and the agitation is going on in other countries. In the juvenile court children are taken out of a purely criminal process and committed to one which is educational, and the court becomes part of the child-saving community.

Indeterminate Sentence.—The principle of the indeterminate sentence is now generally accepted by penologists in the U. S. It is a far-reaching principle which affects the action of the court, the administration of prisons, and the prisoner after his release. The court is relieved from the arbitrary penalties prescribed by the code or from the necessity of determining just when a prisoner shall be discharged. Advocates of the indeterminate sentence regard the fixing of a time by the judge for the prisoner's discharge as irrational as it would be for a doctor to name the date for the discharge of a patient on committing him to a hospital. The relief afforded to the

Treatment

court in not being obliged to impose arbitrary time sentences is but a small part of the value of the indeterminate sentence. Its most important service is in connection with a reformatory system to which the prisoner must be submitted. In fact, without such a system the indeterminate sentence has no significance. It implies the commitment of the prisoner to influences which shall develop him physically, morally, and intellectually, which shall evoke and direct his powers, educate brain and hand, reveal to him aspects of social duty, teach him the value of money, train him in habits of industries and social responsibility. It implies also that the offender shall be released only conditionally until he has proven his capacity during a period of trial to live in society a law-abiding life. In this country the indeterminate sentence was first applied to the Elmira Reformatory. It is applied now to nearly all sentences to reformatories for adults in the country. It has been extended in some states to prisoners sentenced to state prisons. Generally the maximum time for which the prisoner may be held is the maximum penalty fixt in the code. A much larger number of states have adopted the feature of conditional liberation (parole laws), without, however, developing the marking and grading system which furnishes the ladder by which the prisoner climbs to freedom. The question of the prisoner's release is determined by the board of parole, and very often by insufficient information derived from his purely negative conduct while in prison. The U. S. and nearly all the states have laws providing for the reduction of the sentence for good behavior; but the tests of good conduct are few and insufficient compared with those furnished under a marking and grading system as illustrated by Maconochie and Crofton and developed by Brockway of Elmira.

In the paragraph above we have mentioned some essential features of the reformatory system.

The New York State Reformatory at Elmira was opened in 1876. Similar institutions have been established in Massachusetts, Pennsylvania, Ohio, New Jersey, Indiana, Illinois, Wisconsin, Minnesota, and Colorado. Reformatories for women exist in Massachusetts, Indiana, and New York. In addition there are some fifty reformatories for juveniles in the U. S. Adult reformatories on the Elmira plan have not been established abroad, but there are excellent reformatories for minors in nearly all European countries; one of the best of which is at Kassa, Hungary, and another, under De Sanctis, at Pisa, Italy.

Other Prison Systems.—While reformation is the aim of nearly all modern prisons, there is a difference of opinion as to the systems through which it is to be effected. Early in the last century the separate system was established at the Eastern Penitentiary, Philadelphia. Under this system prisoners are assigned to separate cells and have separate yards in which to exercise. The cell is also their workshop. The Eastern Penitentiary has remained the only example of this system in the U. S., but it is the prevailing system in Belgium, and has been partially adopted in France and Italy, or combined with the congregate system.

The Auburn system with congregate labor by day and separation of prisoners by night is the prevailing system in the U. S. without rigid ad-

herence to the rule of silence, and has also been widely followed in Europe. The different prison systems naturally involve different types of construction. The best modern types of the cellular system are found in Europe. In some Southern states state farms have been bought and prisoners are worked in the day at agricultural labor and live in stockades at night. In Alabama they are worked in the mines under state control.

While progress has been made in the development of penological principles their application has been much slower. Progress

Progress in Penology

during the last century is most evident in the following directions: The substitution of a reformatory for a retributive system; the abolition of cruel punishments; the new attention given to the study of the criminal, his environment and history; the separation of accidental from habitual criminals; probation without imprisonment for first offenders, with friendly surveillance; the establishment of children's courts; the appointment of police matrons; the humane treatment of the criminal insane; the development of an anthropometric system for the identification of prisoners, especially the Bertillon system and later the system of finger prints; a higher standard of prison construction and prison administration; the improved personnel in prison management; extension of the civil-service system to the state prisons; new and better principles of classification; separation of the sexes, and young and old offenders; improvement in prison dietaries and sanitation; the prevention and treatment of tuberculosis in prisons; the recognition of labor as a disciplinary and reformatory agent; a general allowance to the prisoner of some share in his earnings; the abandonment of transportation in nearly all civilized countries; substitution of death by electricity for hanging in capital cases, and also the abolition of public execution, and in some countries of the death penalty; the development of the reformatory system in the U. S. for both sexes; the system of conditional liberation found in its best form in the indeterminate sentence; and the new emphasis laid upon preventive instead of punitive or corrective measures, with an increased consciousness of social responsibility.

PENSIONS: A pension is a regular payment of money to a person by the government in consideration of past services in its employ.

Pensions were formerly granted in the United States only to enlisted men of the army or navy who had suffered during our various wars, except in a few special instances. But in 1869 an act was passed providing pensions at the rate of their salary to U. S. judges who have served ten years and resigned at seventy years or upward. Pensions have also been granted to the widows of former presidents. Employees in the life-saving service, in the quartermaster's and pay-

charge come all matters relating to pensions, and who is appointed by the president, by and with the advice and consent of the Senate; two deputy commissioners, a chief clerk, an assistant chief clerk, a law or appeal clerk, a board of legal reviewers, a board of medical reviewers, special examiners, examiners' clerks, copyists, messengers, laborers, and watchmen.

The pension laws since the Civil War have been too numerous and too complicated to be given here, but the growth of our pension list till it has become the chief expense of the government, is seen in the following table:

[From the Annual Report of the Commissioner of Pensions]

| YEAR (ended June 30) | Number of pensioners on the rolls | | | First payments | Pensions, exclusive of first payments | Total disbursements for pensions | Cost, maintenance, and expenses |
|-------------------------|--------------------------------------|-----------------|---------|-------------------|---|--|---------------------------------------|
| | Invalids | Widows, etc. | Total | | | | |
| | | | | Dollars | Dollars | Dollars | Dollars |
| 1862..... | 4,341 | 3,818 | 8,159 | | | 790,384.76 | |
| 1863..... | 7,821 | 6,970 | 14,791 | | | 1,025,139.91 | |
| 1864..... | 23,479 | 27,656 | 51,135 | | | 4,504,616.92 | |
| 1865..... | 35,880 | 50,106 | 85,986 | | | 8,525,153.11 | |
| 1866..... | 55,652 | 71,070 | 126,722 | | | 15,450,549.88 | 407,165.00 |
| 1867..... | 71,856 | 83,618 | 155,474 | | | 20,784,789.69 | 490,977.35 |
| 1868..... | 75,957 | 93,686 | 169,643 | | | 23,101,509.36 | 553,020.34 |
| 1869..... | 82,859 | 105,104 | 187,963 | | | 28,513,247.27 | 564,526.81 |
| 1870..... | 87,521 | 111,165 | 198,686 | | | 29,351,488.78 | 600,997.86 |
| 1880..... | 145,410 | 105,392 | 250,802 | 12,468,191.20 | 44,221,037.88 | 56,689,229.08 | 935,027.28 |
| 1890..... | 415,654 | 122,290 | 537,944 | 38,721,866.03 | 67,371,984.36 | 106,093,850.39 | 3,526,382.13 |
| 1900..... | 752,510 | 241,019 | 993,529 | 9,828,525.07 | 128,633,605.58 | 138,462,130.65 | 3,841,706.74 |
| 1905..... | 717,761 | 280,680 | 998,441 | 8,940,064.00 | 132,202,797.33 | 141,142,861.33 | 3,721,832.82 |

master's departments, and nurses have also received them. Private pension bills are often passed, but by far the largest number of pensioners of the U. S. are such under general laws.

The U. S. pension system may be said to commence with the resolution of Congress dated Aug. 26, 1776, by which the Continental Congress undertook to provide for disabled soldiers of the Revolution. From June 7, 1785, to Sept. 29, 1789, the several states assumed the payment of pensions by a recommendation of Congress on account of its inability to raise money by taxation. After the adoption of the new Constitution, Congress resumed their payment by annual enactments, making them payable during the life of the beneficiaries, under the acts of March 23, 1792, and Feb. 28, 1793.

Pensions were not provided for the children of Revolutionary soldiers. The first act providing pensions for disabled officers and soldiers of the regular army was passed April 3, 1790, and its provisions were renewed and amended from time to time until they were embodied in the act of March 16, 1802, which is now the fundamental law for pensions on account of disability incurred prior to March 4, 1861.

By Act of March 3, 1835, the office of Commissioner of Pensions was created for two years.

It was extended from time to time, and made permanent in 1849. He was to execute, under the direction of the Secretaries of War and Navy, such duties in relation to the various pension laws as might be prescribed by the president.

On March 3, 1849, the pension office became a bureau of the newly created Department of the Interior. As at present organized its affairs are administered by a commissioner, under whose

The following amounts have been paid to soldiers, their widows, minor children, and dependent relatives on account of military and naval service during the wars in which the U. S. has been engaged:

| | |
|--|------------------|
| War of the Revolution (estimated)..... | \$70,000,000.00 |
| War of 1812 (on account of service, without regard to disability)..... | 45,542,069.24 |
| Indian wars (on account of service, without regard to disability)..... | 8,260,143.38 |
| War with Mexico (on account of service, without regard to disability)..... | 38,059,245.23 |
| Civil War..... | 3,259,195,306.60 |
| War with Spain..... | 25,438,355.16 |

| Unclassified..... | 16,135,878.80 |

Actual total disbursements in pensions. \$3,459,860,311.23

Pensions in other countries are granted to many more classes of persons than in the U. S., tho to soldiers on a very much smaller scale. In Great Britain pensions are given to judges of the higher courts, to many other occupants of civil offices, to distinguished authors, scientists, inventors, or to their widows and families. The budget for army retired half-pay in Great Britain for 1906-7 was £2,558,000; navy, £2,460,700; civil service (non-effective and charitable), £800,345, or £5,819,045.

In most other European countries the pension list is still more varied and inclusive. Germany's pension budget estimate for 1907 was 91,259,000 marks. (See OLD AGE PENSIONS.)

PEONAGE: The holding of a man in forced labor till his debts are paid, a form of slavery prevalent in South America and Mexico, and spreading to some of the Southern states of the United States. In some states it exists with

connivance of the law—where a man may be imprisoned for debt, or be allowed to work off his indebtedness. The following illustrates a common form: A negro is fined for a real or fictitious offense; he is warned that he must go to prison or into the chain-gang unless he pays the fine; a seemingly benevolent man is always ready to pay it, and in return for this kindness the prisoner—usually innocent of the art of reading—puts his sign under a contract which "binds him out" to his liberator for a certain length of time. Where this practise is in vogue, from 50 to 200 or more men are usually "bound out" to the employer, who has his own store, where the slaves are charged "fancy" prices, and who manages to keep them continually in debt, with the result that at the end of their servitude the men must either go to prison or sign a new contract; an endless chain is thus started.

The practise came into use in the U. S. after the Civil War. Chattel slavery was abolished, but the negro was still ignorant, and subject to exploitation. In a story told in *The Independent*, Feb. 25, 1904, by a sufferer, and vouched for as true in an introductory statement of the editor, these facts were revealed: that one man was sold in peonage in his eighth year—for his "keep" by his uncle—and stayed till his twenty-first year, and then was held successively for five, ten, and finally three years, until he was "put out" for reasons which reflected not on his morality, but on that of one of his keepers. Into this camp the owner brought at first forty convicts, for each of whom he paid \$200 per year to the state of Georgia, later about sixty. They were quartered in a long, low shanty, called the stockade; guarded night and day by officers of the law. In other instances, according to the same witness, "free" laborers, i. e., those who have tried to work off their debts, have fared little better. Whippings on the bare back or on the soles of the feet are resorted to in case of disobedience. Work is "from sunrise to sunset," i. e., from ten to twelve hours per day. There are a number of these convict camps, the state leasing its prisoners, and helping to recapture them in case of escape, but the number of places where negroes are held in bondage in payment of debt is said to run into the hundreds.

The Public, in its issue of June 27, 1903, stated that two prosecutions for peonage were before the federal courts, one in Alabama, the other in Georgia; and on July 17, 1903, the federal grand jury returned 99 indictments against 15 persons for enslaving negroes under the peonage system. A similar system is practised against poor whites who are friendless, altho with less frequency. On March 8, 15, and 16, 1906, the Boston press gave the names and addresses of three men from that city who had been shanghai'd and kept in virtual slavery on the Florida keys; one of these men claimed that he knew between forty and fifty Boston men in the same condition and place, unable to escape (*Boston Post*, March 15, 1906).

The trial of Bertha Claiche in the summer of 1903 brought out the fact that a number of immoral women are held in virtual slavery in New York City. *The Outlook* (July 18, 1903), commenting on the ruthlessness and the cynic attitude of some employers who pay starvation wages, said that "if it were true that cotton cannot be raised by free labor, it would not alter the resolve of the nation [to stamp out the evil]. If we cannot have both cotton and liberty, we will have liberty, and get along without cotton."

PEOPLE'S PALACE: An institution at Mile End, London, established by John Beaumont in 1840 to furnish the people of East London opportunities for education and recreation. The bequest of Beaumont was badly managed until Sir Edmund Hay Currie took charge of it, and raised £45,000 in addition to the £12,000 still left. In 1882 Walter Besant's story of a "Palace of Delight" in "All Sorts and Conditions of Men" attracted the attention of many people to the institution and gave it the present name. In 1890 the Drapers Company took charge of the educational work, and in 1892 this corporation voted £7,000 annually. The Charities Commission contributes £3,500.

The People's Palace has extended its activities every year since Besant became a trustee. A permanent building—Queen's Hall—was opened by Queen Victoria, May 14, 1887, and other buildings have been erected since. The activities now comprize *entertainments*—given in a large hall, with a seating capacity of 4,000, and a fine organ; *instruction*—given in laboratories, class rooms, libraries, machinery rooms, etc.; *physical culture*—provided by numerous athletic clubs, swimming-tanks, cricket-grounds, etc.; *sociality*—in reception-rooms, dance-halls, etc.

The institution has a day-school limited to 500, preparing for technical courses. The evening classes embrace all kinds of subjects, dress-making, music, languages, commerce, physics, art in relation to crafts, etc. Refreshments are served. The Palace is open to members from 3 to 10 P.M.; the library all day to everybody, Sundays 3 to 10. All kinds of exhibitions have been given on the premises with success. The clubs and classes number over 4,200.

The People's Tabernacle in Jersey City, N. J., has established a People's Palace, chiefly for amusement and recreation.

PEOPLE'S PARTY IN THE UNITED STATES: In 1884 Benjamin F. Butler of Massachusetts was nominated for the presidency by the Anti-Monopoly Party at Chicago, and by the Greenback Labor Party at Indianapolis. He received some 133,000 votes. This common ticket of the two parties was known as the People's Party ticket. The People's Party, however, best known to-day, is quite another and a larger party. Its first direct impetus came from Kansas, tho there had been wide-spread talk of such a party. (See **FARMERS' ALLIANCE**.)

In April, 1890, the Kansas Alliance officers met to consult as to a new political party, and called for a delegate meeting in June. At this delegate convention the People's Party of Kansas was organized.

An enthusiastic state campaign resulted in carrying the state to the extent of controlling the House and defeating the reelection of Senator Ingalls, and sending to Washington the Alliance advocate, Senator Peffer. This success largely led to the sending out of a call to all parties willing to cooperate in holding a national convention in Cincinnati, May 19, 1891. This met,

History and 1,418 delegates were present. Of these more than one quarter were from Kansas alone, and more than three quarters from six states, Kansas, Ohio, Indiana, Illinois, Missouri, and Nebraska. The organized labor of the East was scarcely represented. Mr. Powderly, General Master Workman of the Knights of Labor, was present and

in sympathy with the movement but not a delegate.

In accordance with the vote of this convention, a nominating national convention was held at Omaha, Neb., July 4, 1892, concluding its labors on July 5th. By its action the People's Party was launched. The greatest enthusiasm was displayed.

The names of Gresham and Weaver for president had been prominently before the convention, but General Weaver won on the first ballot, receiving 995 votes. General Field, of Virginia, was nominated for vice-president.

The platform declared for the union of the labor forces of country and cities; for the nationalization of railroads, telegraph, and telephone; a full legal-tender currency, "safe, sound, and flexible"; the free and unlimited coinage of silver and gold at a ratio of 16 to 1; a graduated income tax; postal savings-bank; all land not in actual use to be reclaimed by the government and held for settlers only. The convention also declared itself in favor of reducing taxation, liberal pensions to the soldiers, the restriction of undesirable immigration, reduction of the hours of labor on government work, the Australian ballot, and as condemning the fallacy of protection, the Pinkertons, and other evils.

The total popular vote for the party in 1902 was 1,041,028 with 22 electoral votes (Colorado, 4; Kansas, 10; Idaho, 3; Nevada, 3; North Dakota, 1; Oregon, 1). The largest state votes were: Kansas, 103,111; Texas, 99,688; Alabama, 85,181; Nebraska, 83,134; Colorado, 53,584; North Carolina, 44,736; Georgia, 42,937; Missouri, 41,213. In 1904, taking the State elections

Vote of 1892

and estimating at the presidential vote the states in which there were no elections, the People's Party claimed 1,564,318 votes, led by Texas with 159,224; North Carolina, 148,344; Kansas, 118,329; Nebraska, 97,815; Georgia, 96,888; Minnesota, 87,931; Alabama, 83,283; Colorado, 82,111; Illinois, 59,793; California, 51,304; Ohio, 49,495.

In Congress the Populist strength in the Fifty-third Congress (March, 1893-95) was five senators and ten representatives; in the Fifty-fourth Congress (March, 1895-97) five or six senators and six or seven representatives; in the Fifty-fifth Congress six senators and sixteen representatives.

In 1895, in an off year and with a light vote, the People's Party slightly lessened its vote in Kansas, Nebraska, Iowa, Massachusetts, and New York, and somewhat increased it in Minnesota, Mississippi, Ohio, and Texas.

In 1896 the Democratic Party (*q. v.*) having adopted a platform favoring free silver at a ratio of 16 to 1, and so far inclining to some other Populist demands that it was continually called a Populist platform, the People's Party convention at St. Louis, July 24th, voted, after a prolonged and heated debate, to support the Democratic nominee, Mr. William J. Bryan, the nominating a vice-presidential candidate of their own, Thomas E. Watson, of Georgia. A heated minority claimed that this result was gained by political intrigues of the Democratic leaders. (For the election see **PRESIDENTIAL VOTE**.)

Election of 1896

In 1900 the so-called "Middle of the Road" Populists, who refused to fuse with the Democratic Party, nominated Warton Barker and Ignatius Donnelly, but only polled 50,373 votes. Since then the party has practically ceased to exist, tho a national committee still exists of which James H. Ferris, of Joliet, Ill., is chairman.

PÉRIN, HENRI XAVIER CHARLES: Belgian economist; born at Mons (Hainaut), 1815. Educated at Louvain, was in 1844 chosen to the chair of political economy and law in the Catholic University of Louvain, occupied this position

thirty-seven years, retiring as emeritus professor in 1881. His work on the "Laws of Christian Society" is prefaced by a pontifical breve, dated Feb. 1, 1875, full of unqualified praise from the pope.

Périn founds social order on Divine authority, but he trusts to the moral influence of the Church rather than mechanical obedience to her laws, as pronounced *ex cathedra*.

Périn allows that, in exceptional cases, repressive measures by the State are necessary; but under ordinary circumstances, he thinks, the preventive measures proposed by Christian socialism, in its endeavors to revive the moral force of self-restraint and self-denial, will prove sufficient. He acknowledges the impossibility of returning to medieval forms of corporate union, but strongly recommends the revival of that principle of Christian love which inspired them.

He is author of "Les Economistes, les Socialistes, et le Chrétianisme"; "De la Richesse dans les Sociétés Chrétiennes"; "Le Socialisme Chrétien."

PEROVSKAYA, SOPHIA: Russian revolutionist; born 1854. Tho a member of the aristocracy, the despotism around her early roused a hatred of oppression and desire to protect the oppressed. In 1869, refused permission by her father, she ran away from home, determined to study and know for herself. The wider horizon led to the conviction that the present social arrangements were on a wrong basis, and indicated socialism as the remedy. Meeting with others who shared similar views, they joined themselves into a secret "circle" for the purpose of propaganda among the young; later, in 1871, upon her suggestion, the propaganda was turned in the direction of the working men. In 1873 Sophia Perovskaya was arrested in St. Petersburg; after being imprisoned for a year she was released, but had to go to the Crimea; where for three years she was practically a prisoner in her own home. In 1877 she was brought to trial, in the "trial of the 193," and was acquitted—but instead of being allowed to go free, was exiled to one of the northern provinces. Escaping soon afterward, she returned to St. Petersburg, and again took up work for the revolutionary cause. In all the terrorist enterprises, from 1878 till her death in 1881, she took an active part; often being the director of the most desperate of them, such as the Moscow mine which was to blow up the imperial train, and the attempt which succeeded in assassinating the czar on March 13, 1881. A week later she was arrested, and on April 15 was hanged with Kibalnic, Geliashoff, Timothy Micailoff, and Rissakoff. In person very beautiful, and only twenty-six when she died, she was, with it all, of so kindly and loving a nature that all with whom she worked entertained for her the warmest regard and personal loyalty. (See **NIHILISM**.)

PERU, SOCIALISM IN ANCIENT: Peru in ancient times included a vast extent of territory on the Pacific slope of South America. It was inhabited by many different tribes and nations, all, however, under the scepter of the Incas. The Peruvians seem to have been, in many respects, the most civilized of all the native inhabitants of America, and certainly came the nearest of any to the formation of a true nationality. It is probable that four tribes of the Andes table-land, the Quichuas, the Incas, the Canas, and the Canchas,

formed the nucleus of the nation. From the first comes the name of the ancient language of Peru, Quichua. The second tribe, the Incas, was probably the conquering tribe, and hence became the rulers, or ruling caste. The career of conquest of this tribe or caste, according to native annals, began with the first Inca, Manco Capac, about 1280 A.D.; and before the time of the arrival of the Spaniards the petty state had developed a great empire. It extended from a point north of the equator to Chile, a distance of 2,700 miles, and its area was more than 800,000 sq. m.

The government of the Incas was a despotism, a theocracy, and a unique example of paternal and State socialism. At the head was the Inca, an absolute monarch, but more than a monarch—a god-king, a living incarnation of the sun. Next to him came the nobility, who were regarded as superior beings, and by whose aid the Inca governed the people.

The empire was the result of military conquest and occupation. As peoples were subdued, the laws and even the language of the Incas were imposed on them. The government was secured by an elaborate system of military roads and defenses. Each province had a viceroy appointed by the Inca. Cieza de Leon, an early chronicler, says of the great highway from Cuzco to Quito, that the roads made by the Romans in Spain are not to be compared with it. An elaborate system of couriers made communication with different parts of the empire easy. This military system was carried also into the industrial organization. There was no private property; everything belonged to the State, and everything was managed by the State. It was a communistic despotism. Of the entire produce of the nation two thirds went to the Inca, the nobles, and the priesthood as taxes, one third only to the people, altho they were the only producing class.

In regard to the details of industrial organization Fiske states ("Discovery of America," vol. ii., p. 353):

Families and villages were organized upon a decimal system, like companies and regiments. The average monogamous family of five persons was the unit. Ten such families made a *chunca*, ten *chuncas* made one *pachaca*, ten *pachacas* one *huanaca*, and ten *huanacas* one *hunu*, so that a *hunu* was a district with a population of about 50,000 persons. Each of these decimal subdivisions had its presiding officer, who was responsible directly to his immediate superior, and ultimately to the Inca. The decurion was obliged to perform two duties in relation to the men composing his division. One was to act as their caterer, to assist them with his diligence and care on all occasions when they required help, reporting their necessities to the governor or other officer, whose duty it was to supply seeds when they were required for sowing; or cloth for making clothes; or to help to rebuild a house if it fell or was burned down; or whatever other need they had, great or small. The other duty was to act as crown officer, reporting every offense, how slight soever it might be, committed by his people, to his superior, who either pronounced the punishment or referred it to another officer of still higher rank ("Garcillaso," lib. ii., cap. xii.).

The land belonged to the village community (*chunca*). It was redistributed at times to maintain equality.

Land was divided into *tupus*, one *tupu* for each family, with additions for children. All the farming operations and those of irrigation were supervised by the decurion. If a village suffered from war, or pestilence, or earthquake, other villages were assessed to repair the damage.

It is remarkable that such an artificial system, originally intended for a petty State, could have been adapted to a large empire made up of many different peoples. But it must be remembered that these peoples had not reached a

high grade of culture; the social organization was simple, to begin with. There was little division of labor, and little extension of human wants. Exchange was limited, for there was no money of any kind and trade was by barter. Fiske explains the existence of the Inca State socialism by the theory that the establishment of the ruling caste took place before there had been much development of the idea of private property among the people.

Notwithstanding the complete repression of individual liberty under the Inca government there are great excellencies to be ascribed to it. Of these, the chief is that poverty and idleness were entirely abolished. Every one worked, and every one was taken care of by the State. Prescott, tho inclined strongly to individualism, says ("Conquest of Peru," vol. i., p. 173):

With their manifold provisions against poverty the reader has already been made acquainted. They were so perfect that in their wide extent of territory—much of it smitten with the curse of barrenness—no man, however humble, suffered for the want of food and clothing. Famine, so common a scourge in every other American nation, so common at that period in every country of civilized Europe, was as evil unknown in the dominions of the Incas.

In another passage he says ("Conquest of Peru," vol. i., p. 63):

If no man could become rich in Peru, no man could become poor. No spendthrift could waste his substance in riotous luxury. No adventurous schemer could impoverish his family by the spirit of speculation. The law was constantly directed to enforce a steady industry and a sober management of his affairs. No mendicant was tolerated in Peru. When a man was reduced by poverty or misfortune (it could hardly be by fault) the arm of the law was stretched out to minister relief; not the stinted relief of private charity, nor that which is doled out, drop by drop, as it were, from the frozen reservoirs of "the parish," but in generous measure, bringing no humiliation to the object of it, and placing him on a level with the rest of his countrymen.

The system of the Incas produced in many respects an industrious and happy people. Yet it fell to pieces before the Spanish invaders, with wonderful rapidity, because there was nothing in it to nourish patriotism and independence in the people.

Modern socialism, dealing with the complex problems of a highly developed civilization, can learn little from Peru, where the state of society was primitive and the conditions entirely different. The State socialism of the Incas was unlike anything that ever existed elsewhere, or is likely ever to exist.

PETRUNKIEVITCH, IVAN ILYICH: Member of the Russian Duma; Constitutional Democrat; representative from the Jver Province; born in 1844; ex-justice of the Court of Peace (1869), and chairman of the Court of Appeals (1879). One of the most prominent zemstvo workers in Russia. Member of the Chernigov Provincial Zemstvo (1868); editor of the zemstvo address to the government (1879). Banished for it to the Kostroma Province. Member of the Novotorek Province Zemstvo (1890). Member of the deputation to the czar, June 6, 1905.

PETTY, SIR WILLIAM: Author; born Romsey, Hampshire, England, 1623. He sided with Parliament in the Civil War. In 1651 he was professor of anatomy at Oxford, but in 1652 was appointed physician to the army in Ireland, and about 1654 executed by contract a fresh survey

of the forfeited lands granted to soldiers. He bought large tracts of land and established various industries. In 1663 he invented a double-bottom boat. He was knighted after the restoration.

Petty anticipates or at least gives germs of some conclusions of Ricardo and Adam Smith. One of his leading thoughts was that "labor is the father and active principle of wealth; lands are the mother." He divides population into two classes, the productive and non-productive. The value of any commodity depends, with him, on the amount of labor necessary for its production. He chooses as his unit of value the average food of the cheapest kind required for a man's daily sustenance. He opposes government control of interest, and industry generally. Died in London, 1687. A study of Petty, by W. L. Bevan, was published by the American Economic Association, Aug., 1894. He is author of "Quantulumque; or, a Tract Concerning Money"; "A Treatise of Taxes and Contributions"; "Essays on Political Arithmetic"; "Political Anatomy of Ireland."

PHILADELPHIA: Legislation.—As a result of the decisive defeat of the Republican organization at the polls in the Nov., 1905, election, a special session of the Pennsylvania Legislature was called by the governor to enable it to undo its earlier work and to enact the several laws long demanded in the interest of reform.

This special session, which met on Jan. 15, 1906, and adjourned on Feb. 15th, was one of the most remarkable legislative sessions ever held in any state in the union. It was unique in the annals of Pennsylvania in that it was the only special session that carried out the purpose for which it was called together. It was composed of the same men who at the regular session in Jan., 1905, had servilely executed the orders of the bosses. Yet the same men who had enacted the ripper legislation of 1905, which called forth indignant protest in every part of the state, as unanimously repealed it at the special session. Every item mentioned in the governor's call received the sanction of legislative enactment with a single exception—that of the State Civil Service Bill, which, altho it received a majority vote, did not receive the 103 votes required by the Constitution.

The record of the session includes the passage of the Greater Pittsburg Bill, Senatorial and Legislative Apportionment (which had been delayed and postponed for twenty years and more), the enactment of the Roberts Corrupt Practices Act; the Sheatz Personal Registration Bill for cities of the first and second classes, and the Third-Class City Personal Registration Bill; the Uniform Primary Act; the Jackson Bill, regulating the deposit of state funds, the bill fixing the salary of the insurance commissioner at \$6,000 in lieu of \$3,000 a year and enormous fees; the bill fixing the salary of the Secretary of the Commonwealth at \$8,000 in lieu of \$6,000 and large fees; the Philadelphia Civil Service Bill; the bill making a new salary schedule for the Insurance Department; the Shern bills—one restricting political activities of municipal employees of Philadelphia, the other prohibiting municipal employees from soliciting campaign funds; the bill limiting to \$750,000 the annual expenditures for state bridges in lieu of the present loose law which permitted the expenditure of an indefinite amount practically at the dictation of the Bridge Trust.

The personal registration bills, requiring the personal registration of each voter in advance of the election, represented the culmination of ten years of unremitting effort on the part of reformers of the state. The Sheatz Uniform Primary Bill provides for direct primaries of all parties on the same day under the control of the general election-day officers. The Political Assessment Bill provides that no officer, clerk, or

employee in the government of Philadelphia shall demand, solicit, correct, or receive, or be in any manner concerned in demanding, collecting, or receiving any assessment, subscription, or contribution; nor shall any such officer, clerk, or employee give any contribution intended for any political purpose to any person, corporation, committee, or association.

The Roberts Bill, patterned somewhat after the law in England, aims to prevent corruption by means of publicity. While it places no limits upon a candidate's expenditures, it does provide that he must under oath report his campaign expenses. It requires that all expenditures must first pass through the hands of the treasurer of a committee who must account for every expenditure made.

The regular session of 1907 has likewise a considerable list of excellent legislation to its credit, altho its failure to enact an adequate child labor law will be remembered as one of its most unfortunate shortcomings.

Among other acts a two-cents-a-mile bill was passed and a railroad commission established. Numerous measures intended to give force and effect to constitutional provisions, long ignored, were placed on the statute-books, including one forbidding a railroad corporation to acquire in any way the control of any street passenger railway corporation owning or controlling a parallel or competing line. The Italian Emigration Society's bill, to authorize school boards to open special schools for adults in districts where there is a local desire for them, was passed. A most important measure enacted related to the better protection of children under the age of sixteen; still another extended and defined the liability of employers in actions for negligence.

Investigations.—The scandal growing out of the erection of the \$13,500,000 state capitol was diligently and carefully probed by a committee of the legislature, upon the initiative of Governor Edwin S. Stuart, who pledged himself to that end during his campaign. Gross overcharges and negligence on the part of the architect, builders, and supply men have been disclosed. Both criminal and civil suits have been brought, and the cases may be brought to trial in 1908.

Municipal Utilities.—The city of Philadelphia is completing its \$17,500,000 filter plants and it is expected they will all be in running order within two years.

The gas question has been settled for twenty years. In 1905 an effort was made to extend the present lease for seventy-five years upon grossly inadequate terms. Not only was this proposition defeated, but its introduction led to the revolution in Philadelphia politics which resulted not only in the defeat of the Republican organization at two elections, but compelled it to put up men of high personal character and attainment at the Nov., 1906, election.

The gas lease of 1897 provided that the city might at the end of ten years give notice of the termination of the lease and by paying what had been expended for improvements during that period, take over the plant again. The councils of the city refused to give the notice and to advertise for new bids, so the present lease will continue for the remainder of its term—twenty years.

All electric lighting is done by a private concern, which represents a merger of all the original companies.

All the street-car systems are now under one company—the Philadelphia Rapid Transit Company.

Parks, Boulevards, and Playgrounds.—The development in Philadelphia along these lines

during the past decade, and especially the last four or five years, has been rapid and satisfactory.

A \$2,000,000 art museum at the park end of the boulevard is projected.

Progress on Other Lines

Law and Order.—The high license law and the Law and Order Society are responsible for a very rigid enforcement of the liquor law so far as the licensed saloon is involved. There are very few violations on this score. There are more in connection with places for the illicit and illegal sale of liquor known as the "speak-easies," but the Law and Order Society is equally vigilant as to these and they are fairly well kept in subjection. The same may be said in regard to the social evil, altho the new administration has not been in office a sufficiently long time to enable a general statement in regard to its policy to be made. There has been a great improvement, however, in all that relates to the enforcement of law and order over the conditions prevailing during the Ashbridge administration.

Philadelphia has its full quota of effective charitable, reform, and social organizations. For some years past these have been well sustained and they have contributed to the creation and maintenance of a sound public opinion on important questions of policy.

CLINTON ROGERS WOODRUFF.

PHILIPPINE ISLANDS: Ceded to the United States by Spain, Dec., 1898. The government is composed of a civil governor, who is the chief executive, and seven commissioners (four Americans and three Filipinos), who form the legislative body. There are four executive departments: Interior, Finance, and Justice, Commerce and Police, and Public Instruction, of which the American commissioners are secretaries. The islands are divided into 40 provinces, each with a governor and other officials, the governors being elected by the town councillors. Municipal government exists in over 900 towns, the officials being elected by the qualified voters. There is a municipal police and a military insular police of about 7,500 natives under American and native officers. There is a supreme court with sixteen judicial districts.

Area and Population.—1,700 islands (342 inhabited, 50 of appreciable importance). Total area, 115,026 sq. m. Luzon has 40,909 and Mindanao 36,292 sq. m. The total population (1902) was 7,635,429, of whom 647,740 are uncivilized. Those born in the Philippines are 6,317,548; Chinese, 41,035 (only 577 females); Americans (civilians), 8,135 (1,215 females); Spaniards, 3,888; of the uncivilized tribes, the Mohammedans (Moros) in Mindanao and the Sulu islands

are the most numerous, 277,547; the Igorotes of northern Luzon are 211,510 and the Negrillos 23,511. Luzon has a population of 3,798,507 (223,506 uncivilized). Manila, the capital, has 219,941 (Filipinos, 189,782; Americans, 4,389; Spaniards, 2,528; Chinese, 21,230).

Commerce and Finance.—Revenue (1905), \$16,110,248. Expenditures, \$17,933,162. Customs revenue, \$9,177,386. Exports (1906), \$31,917,000. Imports, \$25,799,000. Exports to the U. S., \$11,579,000; imports from U. S., \$4,334,000. The imports from Great Britain are almost equal to those from the U. S. The principal exports are hemp, sugar, copra, tobacco. The chief imports are rice, flour, wines, dress, petroleum, coal.

Fifty-seven per cent of the males are employed in gainful occupations; of these 16 per cent are engaged in agriculture, 21 per cent in domestic and personal service; 12 in manufacturing and mining; 7 in trade and transportation; 1 in professional service. Two thirds of the factory operatives are in Manila and suburbs, including Cavite, mainly cigar or cigarette makers. Their average earning is 434 pesos per year (\$82). The cultivated land is mainly held by native owners in very small holdings, an average of 8.57 acres, compared with 146.6 in the U. S. The climate is tropical and the difference between cultivated and non-cultivated land is often slight. In the country districts, however, there seems little or no beggary or distress. The wages of field hands on the sugar plantations are from 42 to 63 cents per week, besides keep, which costs little (70 cents per week). Wages have risen since 1893, but cost of provisions has also risen. The planters have lost through the lower price of sugar. Peonage of various kinds is common, and slavery still exists. There are 120 miles of railway and 720 of telegraph, but franchises have been granted for 720 miles of railway, on 295 miles the government guaranteeing 4 per cent interest on construction and equipment for a period not to exceed 30 years.

Education and Religion.—Under the Spaniards education was meager, tho they did something, and the government had begun technical and agricultural instruction. In 1883 about 21 per cent of the population could read, tho less than 54 per cent could speak Spanish. From 1883 to 1903 males who could read and write rose from 208,500 to 735,561; females from 101,273 to 267,624; males able to read only rose from 327,984 to 1,161,325; females from 270,234 to 1,049,508. Technical education is rapidly increasing. In 1905 there were over 3,000 schools and 514,631 enrolled pupils, with 25,000 adult night pupils. There were 865 American teachers and 4,400 Filipino teachers. Private schools are mainly in the hands of the Catholics, but the government has bought the lands of the friars (some 403,000 acres), and is selling to the occupants, the friars fast leaving for Spain or Italy.

Trade-unions are making a small beginning in Manila, but Victor S. Clark, writing on "Labor Conditions in the Philippine Islands" (*Bulletin of Bureau of Labor*, May, 1905), says the main need is of a wage system, not to raise wages, but to increase production and develop the individual. (See also TERRITORIAL POSSESSIONS.)

PHILLIPS, WENDELL: Abolitionist, orator, and reformer; born in Boston, Mass., 1811. His father was first Mayor of Boston in 1822. Educated at Harvard, he was called to the Suffolk bar

in 1834. The agitation on the slavery question was at its height. It was in 1835 that a Boston mob, moved by the commercial spirit, dragged Garrison through the streets by a rope. This event made a profound impression on Phillips, and in 1837 he identified himself with the antislavery cause. In a Faneuil Hall meeting, called to protest against the murder of Lovejoy, he made an eloquent speech. Believing, like Garrison, that slavery was a national sin, he gave up his profession because it required the observance of an oath of fidelity to the United States constitution and consecrated his life to the fight against slavery. He did a great work for years in the North by his wonderful eloquence, but also spoke with perhaps equal power on temperance, the emancipation of women, and labor reform.

Phillips, as has been said, advocated the doctrines of the Garrisonian abolitionists, who believed the constitution of the U. S. to be an immoral compact between freedom and slavery, and who therefore refused allegiance to it, abstained from voting, and labored for the dissolution of the Union as the best means of negro emancipation. When the war came he urged, from the beginning, the duty of emancipation, and he even opposed the reelection of Lincoln, because the latter did not go far enough. In 1865 Garrison proposed that the Anti-Slavery Society should be disbanded. He had been its president for thirty years. But Phillips wished the society to exist for the purpose of securing for the negro his constitutional right of suffrage. Hence he took Garrison's place, and after full citizenship was won for the negro, in 1870, he resigned the office of president, tho he continued to work for the removal of race distinctions in public resorts, etc.

Phillips now turned his attention to other social reforms. The sufferings of the working classes had made a deep impression upon him, and he became an advocate of thorough social and economic reform. In 1870 he was the candidate of the Labor Reform Party for Governor of Massachusetts, and later favored the Greenback Party and worked with it. Harvard College had ignored Phillips, but in 1881, when he was seventy years old, he was selected to deliver the address on the occasion of the centennial anniversary of the Phi Beta Kappa society.

As an orator Phillips is easily in the very first ranks of those whom America has produced. As a social reformer he was devoted and unselfish, and his work was fruitful in the highest degree. He died at Boston, 1884.

PHILOSOPHICAL ANARCHISTS. See ANARCHISM.

PHYSICAL DEGENERATION: A subject largely discusst in Great Britain during recent years. During the South African War, out of 12,000 would-be recruits in Manchester, 8,000 were rejected as virtually invalids and only 1,200 could be regarded as fit in all respects. General Sir Frederick Maurice declared that, according to the best evidence he could obtain, out of every five recruits only two were found fit after two years' service. These and other similar statements arrested general attention. The Government appointed an Inter-Department Commission to inquire into the whole subject of physical deterioration among the masses. This commission issued a report (the first volume in 1904) recommending the systematic and periodic taking

of measurements among school children, in factories, etc., the registration of other data, etc., and for relief, drastic measures against overcrowding, the establishment of labor colonies, education in hygiene and against alcoholism, etc. Progress in degeneration was not proved because of the lack of statistics, and was denied by some, but most of the witnesses heard (Charles Booth and others), believed it had taken place. The great difficulty was declared to be underfeeding and improper feeding. In one quarter of London, the Johanna Street schools, Dr. Eickholz, the medical examiner, declared that 90 per cent of the children were unable to attend to their lessons by reason of their physical condition. Thirty-three per cent had to be fed by voluntary agencies. From the recruiting returns for 1900, out of 52,022 laborers, agricultural laborers, and servants, 285 per 1,000 were rejected; out of 11,971 artisans, 290 per 1,000; out of the smiths, masons, and carpenters, 260 per 1,000; out of the clerks and shopmen, 306 per 1,000. (See also POVERTY.)

PHYSIOCRATS (from Gr. *physis*, nature, and *nomos*, rule): A name given to a school of French economists and philosophers which arose in the eighteenth century, largely led by François Quesnay (q. v.), 1694-1774. The distinguishing doctrines of the physiocrats were that a so-called natural constitution or order exists in society, the violation of which causes all the evils suffered by man; that in this natural order man has a fundamental and inalienable right to freedom of person, opinion, property, contract, or exchange. The physiocrats held that all wealth is derived from the soil, thus denying the principle of the mercantilists (q. v.), who virtually held that wealth consists in the precious metals. Labor expended in manufacture or in commerce the physiocrats held to be sterile, tho useful, in that, while it transferred or transformed wealth, it did not produce it. Thus, conceiving all wealth to be produced from the soil, they argued that all revenues for the State should be derived by a direct tax on land, and thus became the predecessors of the believers in the single tax (q. v.). They advocated complete freedom of trade and *laissez-faire*. Their influence on their day and succeeding thought was very deep, altho not always acknowledged. Adam Smith (q. v.) seems to have imbibed and to have been influenced by very many of their ideas. For the details of their school and its leaders, see their respective names (see also POLITICAL ECONOMY). Dr. Gustav Cohn, in his "History of Political Economy," translated by Dr. J. A. Hill, says of the school as a whole:

The French philosophical school of the eighteenth century, which deserves the lasting honor of having founded a science of economics, was at first much ridiculed by its contemporaries and later on account of its growing influence and questionable conclusions—much abused. . . . It is none the less true, as Knies declares in his reply to Hildebrand, that "however little credit they may get for it in the popular tradition, much of their thought—tho presented to be sure in the name of Adam Smith—is still regarded as unshaken truth."

The enduring importance of the economists consists in the eminent ability with which, unlike their predecessors, they comprehended and formulated in a philosophical system the practical characteristics of their own age. Realizing that the workingman was overburdened with taxes and feudal dues, they were led to adopt an entirely new theory

of productivity. The realism of Adam Smith brought this theory into closer relations with practical life; but Smith, far from developing the doctrine scientifically, did not even understand it; and so the thread of the argument was not taken up again until Ricardo's time. Upon this conception of productivity the physiocrats built up their single-tax theory, which furnished a scientific basis for the principle, the assessment, and the obligation of taxes; they established a philosophical foundation for their aversion to the regulations which absolutism had adopted from the corporations of the Middle Ages; the corner-stone of this foundation was the principle of self-interest, the workings of which, borrowing from the mechanical ethics of the century, they traced to natural law; all this, and even more, was the peculiar work of the physiocrats.

They demanded the reign of the natural order (*ordre naturel des choses*) and hence the Greek name given them by one of their followers (Dupont de Nemours).

In emphasizing the productivity of agriculture, or indeed in calling it the only productive occupation, the physiocrats are not to be understood in the sense falsely imputed to their words; for they did not mean that the heavily burdened peasant was the only productive man. Indeed, the real meaning of the word productive, as applied by them to agriculture solely, has a much wider significance than any philistine comparison of the advantages of manufactures on the one hand with those of agriculture on the other. As the deliverance of the starving masses from the traditional pressure of taxation and feudal burdens was uppermost in the thoughts of the physiocrats, they deduced from the theory of the exclusive productivity of agriculture (that is, the yielding of a surplus over the cost of production) their argument in favor of a single tax. This tax should bear heavily upon the landowners; hence, the theory could assume an aspect friendly to agriculture only by the complete separation of landowners from the peasant classes, being favorable in such a case to the masses, whose misery had already attracted the attention of Sully and Colbert. From a practical standpoint, the essential thing is not so much the prominence given to agriculture compared with industries and manufactures, as the intercession in behalf of the masses of laboring people; not the presentation of a new theory of taxation, but the demand for the deliverance of the masses from the burdens of traditional imposts. It is only because the masses were engaged in agriculture, and only so far as agriculturists belonged to the working masses, that the demands of the physiocrats were favorable to agriculture.

Agriculture and Taxation

Their theory of a natural tax, the *impôt unique* or *impôt direct*, is admirable for its scientific consistency with their system; how thoroughly socialist it is in its opposition to the landlords has for the most part entirely escaped notice in the usual repetition of their "overestimation of agriculture." Indeed, the physiocrats declared that the landlords were entirely superfluous, as they performed no labor; that if the State should absorb the entire rent, and thereby deprive them of their means of support, society would be just as well off as it was before; and that the landlords, therefore, should be quite content if the State, to provide for its wants, took a part only of the rent of their land as a just compensation for the protection it afforded their property.

Cohn criticizes the physiocrats for the ambiguity that lay in their conception of a natural law of social life, which led them to limit nature to agricultural activities, and thus to limit the surplus which should be taxed to the rent of land. (See SINGLE TAX.)

The most prominent physiocrats were Quesnay (q. v.), the physician of Louis XV. (q. v.); Turgot (q. v.), intendant and minister of Louis XVI.; Marquis Mirabeau; Abbé Baudeau, and Mercier de la Rivière. Baudeau produced a text-book which resembled the later text-books of political economy. The numerous writings of the school were collected and published in 1844 by Eugène Daire under the title "*Œuvres des Physiocrates*" (2 vols.) and "*Œuvres de Turgot*" (2 vols.). Before that time, in 1768-69, a collection of these writings had been published in six volumes by Dupont de Nemours. The collection was entitled "*Physiocratie, ou constitution naturelle du gouvernement plus avantageux au genre humain*."

Despite many differences in details, these writers all agree in the essentially fundamental principles and doctrines. The especially noteworthy works are "*Tableau Économique*," by Quesnay (1758), and an essay by Turgot, entitled "*Réflexions sur la formation et la distribution des richesses*" (1766).

PIECE-WORK is work done or paid for by the quantity or piece. This is the usual system in many trades, especially in tailoring and shoe-making, in almost all trades producing personal

wear, in printing, etc. Mr. Mundella said, in 1876, that 90 per cent of production was piece-work. This is probably not true to-day. Certain trades, where many men have to work together in one operation, scarcely admit of piece-work. Says Professor Marshall ("*Economics of Industry*," p. 393):

The system of piece-work is seldom found in the finest and best of industrial relations. The most careful and artistic work can seldom be measured by it; and in many trades, especially small trades, the work varies so much from bench to bench, and from day to day, that no regular tariff can be devised; and piece-work degenerates into contract work, in which the individual workman has to bargain alone with his employer.

But in the majority of trades, the various tasks can be graded accurately; and when a list of prices for them is agreed on, the employees grade themselves, and yet present an unbroken phalanx in bargaining with their employers. Piece-work adds to the wages of the industrious workers, and it checks those habits of half-hearted work which flourish in every rank of life where the soil is favorable.

Workmen, however, have learned by experience not to take so favorable a view of piece-work. Professor Marshall says (*idem*, p. 394):

In some cases this is caused by an undue eagerness of certain employers to reduce piece-work rates when they have thought their men were taking too much money home. Some workmen oppose it because they desire to take things easily, and have perhaps a latent dislike to be graded according to their merits. And some oppose it because they think it makes work scarce, by inducing men to get through more of it than they otherwise would; and here again come in the combined effects of a little trade-selfishness and the fallacy of the fixt work fund. Perhaps these imperfections of human nature, rather than unionism, are further to be held responsible for whatever ground there may be for the complaint that some unionists urge their fellows not to exert themselves overmuch, and absorb work that others might be glad to do. This is not effected by general regulations; but in some workshops, unionist and non-unionist alike, social pressure is brought to bear on any one who works so hard as to set a standard of work higher than the others like; and no doubt the presence of a union element may increase this pressure.

Workmen, however, claim that this effort, not to allow any one to work too hard, is due not to any dislike of work, but to the necessity under present conditions to make a job go as far as it can, employ as many men as possible, and be paid for as highly as possible. It is an inevitable result of the present system. Says Mr. George Gunton ("*Wealth and Progress*," p. 180):

Workmen agree among themselves not to do more than a certain quantity of work, because repeated experience has taught them that if they do, their wages will soon be proportionately reduced. That is why, in some trades, the unions forbid the men to produce more than a given quantity per day, which is so bitterly denounced as one of the injurious features of trade-unions. This practise is adopted the most when new kinds of work or new machinery are introduced, in order to keep the price "per piece" as high as possible.

Why rapid work reduces wages Mr. Gunton explains. He shows that wages depend on what it costs the workingman to live according to the standard of comfort of his class. He cannot long get more than this, because, if he does, some other workman will offer to work at this standard of comfort price and, under competition, the employer will be compelled to employ him, since the competition compels him, in order to sell cheap, to hire the cheapest labor which can produce a given quantity and quality of work. Hence, if, either by day-work or by piece-work, workmen are seen to be earning more than the standard of comfort wages, the employer not only usually does cut down the wages, but is usually compelled to cut them down. Hence competition

prevents working men from long earning in any system wages above the standard of comfort, and apud work lowers their wages. Says Mr. Gunton (idem, p. 181):

Altho this law has never been understood, it has always been implicitly obeyed. Consequently, wherever the wages system prevails, whether the price of labor is fixed by royal proclamation, statute law, or competition, we find the rate of wages tends to conform to the cost of living, and the price of "piece-work" to the rate of wages for "day-work."

Accordingly, in the various statutes regulating wages in England from the fourteenth to the eighteenth centuries, we find the price fixed for "piece-work" always sustained a uniform relation to that of "day-work." For instance, thrashing a quarter or mowing an acre of wheat was always regarded as a day's work. Hence, in the thirteenth century, when harvest wages were 3d. a day, the price of mowing an acre or thrashing a quarter of wheat was 3d. also. During the same period, when artisan wages were 3d.

History

a day, the price for a pair of sawyers to saw 100 planks—which was always reckoned a day's work—was 1d.

So when wages rose after the rise in prices in the sixteenth, seventeenth, and eighteenth centuries, the price of "piece-work" always rose correspondingly with that of "day-work." Thus, in 1651, when the Essex magistrates fix the wages of common laborers at 1s. and 3d. a day, the price of sawing 100 planks was fixed at 2s. and 6d. or 1s. and 3d. for each sawyer. And if we compare the price paid for "piece-work" in the same industries in different countries or localities where similar methods of production are employed, we shall find that the rate paid will vary according to the difference in the cost of living.

Again, in manufacturing industries, where machinery is extensively used and "piece-work" is the general practice, altho the average wages keep pace with the average cost of living, the price of "piece-work" always varies inversely with the productive capacity of the machinery. In the cotton industry evidence of this fact is constantly in view. Through the changes in machinery, which are mostly gradual, it sometimes happens that two kinds of machinery (the new and the old) are in use in the same factory, and very often in the same locality, at the same time, and accordingly we frequently find two different prices paid for the same work in the same town, and even in the same establishment—not a different rate of wages, but a different scale of prices, in order to equalize the rate of wages. And sometimes, in order to avoid two scales of prices for the same work, one will be put on "day-work," the rate of wages being fixed upon the average earnings of the other. In fact, this is the general practice on new machinery, until its productive capacity is correctly ascertained, after which the scale of prices is fixed accordingly.

I have, myself, seen three different prices paid for weaving the same cloth in the same room, all because it was woven

in different kinds of looms. For example, a 50-inch loom will not run as fast as a 30-inch loom—i. e., the shuttle will not, *ceteris paribus*, pass as many times a minute across a 50-inch space as it will across a 30-inch space. While the former to-day will run at the rate of from 130 to 150 picks a minute, the latter will average from 180 to 200 picks a minute. It will thus be seen that when 30-inch cloth is woven in 40- or 50-inch looms, the weavers on the broad looms cannot weave as many yards per day as those on the narrow looms; hence a higher price per cut is always paid for weaving narrow cloth in broad than in narrow looms.

If we examine the shoe trade we find the same unvarying law obtains; and while the average wages of shoemakers have grown in a direct ratio with the cost of living, the price per pair for making shoes has grown less and less in proportion as improved machinery has been adopted. The same is strikingly true in the watch and jewelry business.

Present Facts

The price of "piece-work" for pivoting, burnishing, gilding, fitting, casing, etc., through the use of improved tools and machinery, is in many instances from 50 to 75 per cent less than it was formerly. Still, the real wages in these industries are not reduced, the price of "piece-work" being lessened only in proportion as the capacity to produce is increased. But while wages never rise in the same proportion with the increased power of production, the price of commodities always falls in that ratio; consequently, tho the nominal wages of watchmakers, jewelers, shoemakers, and weavers are not proportionately higher, the prices of watches, jewelry, cotton-cloth, and shoes are relatively lower. This explains the fact that the direct and immediate effect of improved machinery is always more strikingly seen in lower prices than in higher wages, all of which is in strict accord with the doctrine that the price of labor always moves in direct ratio with the cost of living, and that of commodities in direct ratio with the cost of production.

It will thus be observed that wherever we go or to whatever industry we turn our attention, we find that the price of labor, either under "piece-work" or "day-work," is ultimately governed by the same law. Manifestly, therefore,

"Whether laborers work by the piece or work by the day,
The cost of their living determines their pay."

The above principles are well illustrated by the following table as to the actual prices paid by day-work and piece-work in Massachusetts and Great Britain. The table is taken from the "Sixteenth Annual Report of the Massachusetts Labor Bureau" (1885, p. 113). It will be seen that in these industries, in both Massachusetts and Great Britain, piece-workers receive less average weekly wages than day-laborers:

GENERAL AVERAGE WEEKLY WAGE PAID TO DAY, PIECE, AND DAY AND PIECE EMPLOYEES

| INDUSTRIES | MASSACHUSETTS | | | GREAT BRITAIN | | |
|---|---------------|-------------|---------------------|---------------|-------------|---------------------|
| | Day hands | Piece hands | Day and piece hands | Day hands | Piece hands | Day and piece hands |
| Agricultural implements..... | \$9.94 | \$14.27 | | \$8.85 | | |
| Artizans' tools..... | 11.88 | 10.81 | | 16.94 | | |
| Boots and shoes..... | 14.53 | 11.42 | | 14.93 | \$5.42 | |

| Worsted goods..... | 7.39 | 7.21 | | 2.55 | | 14.27 |

¹ Indicates that of wages on more than one basis the highest has been used.

| CLASSIFICATION | MASSACHUSETTS | | GREAT BRITAIN | |
|----------------------|----------------------|-----------------------------|----------------------|-----------------------------|
| | Number of industries | General average weekly wage | Number of industries | General average weekly wage |
| Day hands..... | 24 | \$10.46 | 24 | \$7.43 |
| Piece hands..... | 21 | 9.85 | 9 | 7.17 |
| Day and piece hands. | 5 | 9.69 | 9 | 6.01 |

There can be no questioning these facts. Hence workmen have learned that by working fast they do not permanently increase their pay, but soon find themselves producing more, working faster, and employing fewer men, while their wages are not higher. They do find, however, that wages rise by making labor more costly.

The best and most intelligent workmen, therefore, do not favor piece-work; it is usually the more ignorant tho quick new workers who sometimes favor it, because for a while it seems to enable them to earn more; a gain, however, soon to be lost when the employer lowers the wage to bring it down to the level of earnings necessitated by the competition of the market.

Piece-work also often makes the worker scant his work and sacrifice quality to quantity. Nevertheless, in many trades it prevails, because employers usually favor it, since it enables them to get more work for the same pay, and because in many trades, where quantity counts for more than quality, it is a convenient form of payment.

Piece-work seems to be more favored in Great Britain than in the United States. Mr. and Mrs. Webb found, in 1894, that 49 British unions with 573,000 members preferred piece-work, that 38 unions with 290,000 members preferred time-work, and that 29 unions with 140,000 members used both. In general, however, in both countries piece-work is on the increase, owing to the high tension of industry, tho the change is often resisted sometimes to the extent of a strike, like the long strike over this cause, 1902-3, in the Union Pacific Car Works.

PINGREE, HAZEN S.: Municipal reformer; born in 1842 in Maine. In 1856 he served his time in a shoe factory. At the age of twenty enlisted, served through the Civil War, and was six months a prisoner at Andersonville. At the close of the war he found work in a shoe factory at Detroit, and there started a small factory of his own. A man of great business ability, keen instincts, and sterling honesty, he soon had the largest shoe factory west of New York. In 1889 he was elected Mayor of Detroit on the distinct issue of saving the city from municipal corruption and mismanagement. Opposed by a corrupt council and private companies who could buy whatever franchises they wanted, he flung himself into the fray with indomitable energy, and began at once to run the city on business principles. In his first message he announced that the time was come for the city to do its own fighting. The companies fought him; the council fought; but he prevailed. He also fought for municipal ownership of the street-railways, and

from the gas companies secured a reduction of rates from \$1.50 to \$1. In the hard times of 1894 through his potato-patch scheme he successfully relieved, and showed others the way to relieve, the unemployed. He strove also for free water, direct legislation, a general adoption of the eight-hour-day, and other reforms. In 1896 he was elected Governor of Michigan on the Republican ticket, and still did valiant service for the people. He was author of "Facts and Opinions; or, Dangers that Beset Us." Died 1901.

PINKERTON, THE, AGENCY AND LABOR STRUGGLES:

In 1852 Allan G. Pinkerton, a Scotchman, involved in the Chartist outbreak in Birmingham, emigrated to the United States, and here, having from love of adventure secured the arrest of a band of counterfeiters, established in Chicago a detective agency. His agency was successful, and during the War of the Rebellion Mr. Pinkerton superintended the secret service of the army. The U. S. Secret Service developed out of this army service (1864); it is, however, so completely engrossed with its duties as a division of the Treasury Department that other matters are necessarily referred to other agencies. Thus the War Department employs men to obtain special and varied information, and the Post-office Department in 1872 established an efficient division charged with the investigation of mail depredations. When the industrial conditions of the country led to violence and strikes, Pinkerton organized a body of armed men who were hired to protect the property of the employers. Later, in the labor troubles in Pennsylvania, Pinkerton's agency was employed against the Molly Maguires, a secret society founded in the coal-mining section of Pennsylvania, which was exposed chiefly through the instrumentality of James McParlan, a detective, and Franklin B. Gowan, president of the Pennsylvania & Reading Coal & Iron Company. Henceforth the Pinkerton agency was employed more and more by employers to defend their works from threatened violence on the part of mobs in connection with strikes. They became bitterly hated by working men. The working men claim that the Pinkertons do more than protect the property of their employers. They claim that the agency goes into the slums of the great cities, hires desperadoes and men of the worst character, swears them in as special detectives, and then sends them not only to protect the property of employers, but to incense the populace and provoke it to violence, then firing upon the populace on the least provocation. The working men claim that the Pinkertons create more evil than they allay. Stories are circulated of the Pinkertons secretly doing violence themselves, laying it to working men, and then firing on them. In the great Homestead strike (q. v.) Pinkertons in large numbers and armed with rifles were brought to Homestead, the working men rising and repulsing them as they would an invading army. Working men claim that the duty of protecting property should be left to the police; that if these are not sufficient, the army should be called in, but that bodies of reckless armed private mercenaries should not be allowed to fire on citizens. As a result of this popular feeling Congress appointed a committee to investigate into the employment of such private armed bodies of men, and some states passed

bills forbidding such employment. (See **HOMESTEAD STRIKE**, and **STRIKES**.)

Nevertheless, the Pinkerton and other agencies are continually employed in times of strikes, and the former is said to have been particularly active in the Colorado labor struggles. During the Haywood trial (June, 1907) attempts were made by labor agitators to charge the Pinkerton agents with fomenting strife among and violence on the part of the Western Federation of Miners. A number of letters from operatives in the pay of the Pinkerton agency were placed in evidence in court, which, however, proved nothing more than spying on the part of these men. The letters were obtained and placed before the court on behalf of the defense by Morris Friedman, a young Hebrew-American who testified that he had been stenographer to McParland, the manager of the Denver agency, and admitted that he had taken many letters from that office, without asking anybody's permission, for use at the "proper time and place, as I have done." These letters, together with other evidence, were, however, stricken out and withdrawn from the jury in the Haywood trial (1907) as soon as the defense rested without making the necessary connection to make them material. Friedman admitted having written a book based on his observations in the Pinkerton office under the title "The Pinkerton Labor Spy." The publishers of this work in their preface state that they "recognize the Pinkerton agency as an indispensable instrument to the capitalist class in the great and unceasing struggle with labor." (For a complete statement of this phase, and a statement of contrary views, see article **WESTERN FEDERATION OF MINERS**.)

The assertion that Pinkerton agents have been engaged in espionage in the interests of capitalists has not been denied, and the practice concerns this work, therefore, only in its relations to society. The Pinkertons were responsible for the disbanding of the "Molly Maguires"; for the capture of a gang of thieves who had robbed the Adams Express Company safe of \$700,000 on a New York, New Haven, & Hartford Railroad train (Jan. 6, 1866), and in dispersing a body of murderers who had terrorized the State of Indiana for a number of years.

Why do private corporations employ private detective agencies instead of calling upon the police of the municipalities and the constabulary of the states? Is it from choice or from necessity? Why do, moreover, the Government of the U. S., the governors of the states, and the mayors of the cities in this country permit such agencies to exist? Other civilized countries do not permit private police agencies to interfere with the state agencies of public safety. Why, then, has such a condition arisen in this country?

There can be only one answer to these questions. The inadequacy and the inefficiency of our police force—taking this word in its widest sense, as implying all agencies that have to do with the prevention and detection of crime, the maintenance of public safety, and the protection of life and property. This inefficiency may be due to one or all of three causes: (1) Paucity of numbers in the force; (2) intellectual deficiency of the men employed; (3) lack of integrity.

1. *Paucity of Numbers*.—The fact that we have too few men in our police force becomes evident from the fact that in all large business concerns of our large cities private policemen and detectives are employed and paid by their employers.

Even private families or, where single families cannot afford that luxury, several families combine in hiring private policemen for their own protection. Apart from this generally known fact statistics tend to prove the same contention. London had in 1905 approximately 1 policeman, etc., for 390 of the population; Berlin 1 for 453; Vienna 1 for 480; Paris 1 for 340; New York (1903) 1 for 495. That is, New York City, with its heterogeneous population—fully one fourth of whom arrived within ten years previous to that date from foreign countries—with its large area, had a smaller police force proportionately than either of the large cities of Europe with their homogeneous and largely native population, and small areas. This force has since been increased, but it is doubtful whether the increase has been proportionate. The percentage of police to the population is, of course, smaller in other American cities, e. g., Chicago, 1 to 644, and very much smaller in country districts where there is usually only a sheriff and a constable to a whole county with sometimes a population of 10,000 outside of the cities. The paucity of men on our police force is, then, an established fact, and this necessitates a private detective agency. This is never more forcibly illustrated than in times of strikes where the municipal police have repeatedly been found unequal to the task of protecting life and property.

2. *Intellectual Deficiency of the Men*.—Our police is largely appointed through political influence. This used to be altogether the case in the cities, where foreigners—coming perhaps from the country districts or from small villages—were invested with the powers and insignia of public guardians within a month or even less time after their landing. No proof needs to be furnished that these men were entirely unfit to deal with the quick, ingenious, subtle, shrewd, and experienced criminals of large cities. The introduction of civil-service examinations has effected a change for the better in this direction. But physical fitness, ability to read and write, proof of citizenship are not sufficient to turn a formerly good and inoffensive citizen into a clever detective. The detectives are largely selected from the police force; they are, as a rule, but little better equipped for their special duties than the roundsmen. Finally, the sheriffs and constables in the country districts, and police commissioners in the city, are elected, mostly without even a question being asked by the electorate as to their fitness for such offices. It is practically impossible under present conditions to develop an intelligent class of detectives, since the tenure of police commissioners is dependent on the accidents of politics.

European countries pay special attention to this branch of service. They develop men who have particular aptitude as detectives; the latter must, as a rule, be well educated, speak several languages, and have the ability to move among all classes of men. The secret-service men in India, for instance, where problems are somewhat similar to those of America, are a picked force, having been trained carefully and having served a long apprenticeship before being appointed.

From the intellectual point of view, again, there is, consequently, need for private detectives carefully trained and gifted with special aptitude—such men as are employed in the United States Secret Service.

3. *Lack of Integrity*.—Little need be said on

this point, since the newspapers have often spoken about it. "Graft" is a word so generally connected with our police that it is really a wonder how patient and long-suffering American citizens are, paying good salaries to men for inefficient service, and being compelled to pay bribes in addition. We quote Mr. George R. Turner (*McClure's*, April, 1907): "It is not necessary for me to tell you that you have practically no protection on your streets. . . . The condition of the department is summed up in the statement that in two years, 1904-5, over half the force was before the police trial board for one cause or another. . . . There must be, at a conservative estimate, \$200,000 a year paid over to the police for protection to the business of dissipation" (in Chicago).

This lack of moral integrity again calls for private detectives whom the employer may trust without fear that the very interests for which he pays are protected by the employee for graft. If private agencies must be abolished, as some claim, the only way to replace them is to organize a state police force, constabulary and detective, that is efficient in quality and sufficient in numbers to take proper charge of the interests entrusted to their care—men carefully trained for particular duties, honest and morally reliable. This cannot be done in a day or a year, but it is greatly desirable that it should be done both in the interests of the state, the public, and the laboring classes who would welcome a police of this kind and not suspect it to be in the pay of capitalists. (See article POLICE.)

RUDOLPH M. BINDER.

PLACE, FRANCIS: A master tailor who played a large and important part in the English labor movement at the beginning of the nineteenth century. Before setting up his own shop at Charing Cross, London, he had worked as a journeyman breeches-maker, and had been active in effecting organizations in his own and other trades. After 1818 he left the conduct of his business to his son, and devoted himself wholly to the labor movement: first to the repeal of the combination laws, and second, to the reform movement. He was a pupil of Bentham, a radical individualist, and a shrewd parliamentary lobbyist. As early as 1810 he testified before a select committee of the House against measures proposed by the employers, and in 1814 set himself seriously to overthrow the combination laws (see CONSPIRACIES). Working through a little working-class paper, the *Gorgon*, he gained the support of Joseph Hume and J. R. McCulloch, then editor of the *Scotsman*. Joseph Hume, in the House of Commons in 1822, gave notice of his intention to bring in a bill repealing all combination laws, but Place really managed the case, marshaled the witnesses, and arranged their evidence. Scarcely realizing what was done, Parliament passed the bill. The employers were now thoroughly roused, and the next year succeeded in partly modifying the bill, tho Hume in Parliament, and Place outside, ably fought them at every point. After this Place took less active part in the movement. (See "History of Trade-Unionism," by Sidney and Beatrice Webb.)

PLATO: Philosopher; born in Athens B.C. 429, the year of the death of Pericles. At the age of twenty, coming under the influence of Socrates, he chose philosophy for his life pursuit, but was

driven from Athens and lived in Sicily, visiting (probably) Italy and Africa. At the age of forty he was able to return to Athens and establish a school of philosophy, the Academy, a garden, where for forty-one years he taught, his greatest pupil being Aristotle. His greatest economic writings are "The Republic" and "The Laws." Died B.C. 347. The following review of his economic teachings is given in Professor Ingram's "History of Political Economy." He says:

The most celebrated of Greek ideal systems is that of Plato. In it the idea of the subordination of the individual to the State appears in its most extreme form. Within that class of the citizens of his republic who represent the highest type of life, community of property and of wives is established, as the most effective means of suppressing the sense of private interest, and consecrating the individual entirely to the public service. It cannot perhaps be truly said that his scheme was incapable of realization in an ancient community favorably situated for the purpose. But it would soon be broken to pieces by the forces which would be developed in an industrial society. It has, however, been the fruitful parent of modern Utopias; specially attractive as it is to minds in which the literary instinct is stronger than the scientific judgment. Mixed with what we should call the chimerical ideas in his work, there are many striking and elevated moral conceptions, and, what is more to our present purpose, some just economic analysis. In particular, he gives a correct account of the division and combination of employments, as they naturally arise in society. The foundation of the social organization he traces, perhaps too exclusively, to economic grounds, not giving sufficient weight to the disinterested social impulses in men which tend to draw and bind them together. But he explains clearly how the different wants and capacities of individuals demand and give rise to mutual services, and how, by the restriction of each to the sort of occupation to which, by his position, abilities, and training, he is best adapted, everything needful for the whole is more easily and better produced or effected. In the spirit of all the ancient legislators he desires a self-sufficing State, protected from unnecessary contacts with foreign populations which might tend to break down its internal organization or to deteriorate the national character. Hence he discountenances foreign trade, and with this view removes his ideal city to some distance from the sea. The limits of its territory are rigidly fixed, and the population is restricted by the prohibition of early marriages, by the exposure of infants, and by the maintenance of a determinate number of individual lots of land in the hands of the citizens who cultivate the soil. These precautions are inspired more by political and moral motives than by the Malthusian fear of failure of subsistence. Plato aims, as far as possible, at equality of property among the families of the community which are engaged in the immediate prosecution of industry. This last class, as distinguished from the governing and military classes, he holds, according to the spirit of his age, in but little esteem; he regards their habitual occupations as tending to the degradation of the mind and the enfeeblement of the body, and rendering those who follow them unfit for the higher duties of men and citizens. The lowest forms of labor he would commit to foreigners and slaves. Again, in the spirit of ancient theory, he wishes ("Legg.," v., 12) to banish the precious metals, as far as practicable, from use in internal commerce, and forbids the lending of money on interest, leaving indeed to the free will of the debtor even the repayment of the capital of the loan. All economic dealings he subjects to active control on the part of the government, not merely to prevent violence and fraud, but to check the growth of luxurious habits, and secure to the population of the State a due supply of the necessities and comforts of life.

PLAYGROUNDS: To the necessity of providing places for children in large cities to romp, play, and exercise, playgrounds owe their origin. They are to take the child away from the crowded streets, where life, limb, health, and morals are in danger, and to give him a better opportunity to develop physically, morally, socially, and intellectually. The country and small village offer plenty of space; the city must provide it at large expense. It is an expense which bears good interest in the better physique, cleaner morals, keener intellects of our future citizens.

The history of playgrounds goes back to the kindergarten movement of 1826. When the direction of children's play was recognized as necessary, the conclusion that children should have the opportunity to play was apparent. Accord-

ingly, city after city has established free playgrounds either on school or municipal grounds. Glasgow led; Berlin, Hamburg, and other large cities of Germany, England, and America soon followed.

The scope of playgrounds is usually this: sand piles for little children—to be renewed frequently so as to keep them clean and wholesome; gymnasium, running-tracks, basketball grounds, etc., for boys; seesaws, swings, etc., for girls. During adolescence boys and girls need special physical exercise, e. g., dumb-bells, staffs, in the open air under separate instruction.

A feature of many German playgrounds needs particular mention—the concert garden playgrounds where mothers may leave their little ones while they attend the concert or the matinee.

In order to obtain the best results, it is necessary that instructors should be present at all times, both for supervising and teaching new games.

Seward Park in New York City is a type of the best playground, and a brief description will give the best idea of the function of this institution. It cost the city \$1,800,000, and is located in the Ghetto, a very crowded down-town district. At one end a complete outdoor gymnasium surrounded with a running-track; at the other swings, seesaws, etc., for girls; in the middle sand piles, tents, etc., for the little ones. The mothers are encouraged to be present with their little ones, and provision is made that milk and crackers can be bought on the premises. New York City has set aside \$300,000 per annum for the purchase of playgrounds.

Lately (1906) a Playground Association of America has been formed with Theodore Roosevelt as honorary president and Dr. Luther Gulick, New York City, president. The headquarters of the association are 926 F Street, N. W., Washington, D. C., and Dr. Henry S. Curtiss is secretary. Many prominent citizens are on the executive committee. This fact is sufficient evidence of the recognition of the necessity and importance of the movement for playgrounds in all American cities. Germany has a special "Annual" of some 400 or 500 pages—"Das Jahrbuch des Volks- und Kinderspiels."

PLUNKETT, HORACE CURZON, SIR: Commissioner on Congested Districts Board, Ireland; born 1854, educated at Eton and Oxford; engaged in cattle ranching in the United States, 1879-80. Promoted agricultural cooperation in Ireland from 1899; founded the Irish Agricultural Organization Society, 1894; chairman of the Recess Committee, 1895, the report of which eventually led to the creation of the Department of Agriculture and Technical Instruction for Ireland in 1899. Member of Parliament for South County Dublin, 1892 to 1900; member of the Privy Council in Ireland in 1897; Fellow of the Royal Society. Sir Horace's views on social and economical questions are well set forth in his book on "Ireland in the New Century." Address: 105 Mount Street, Dublin, Ireland.

POLAK, HENRI: Dutch Socialist; president of Diamond Workers' Union; born in 1868, at Amsterdam; educated in the Jewish elementary school until the age of twelve; apprenticed to diamond-cutting; worked at that trade until 1895, spending three years of that time in London. In 1890 he became member of the Social Democratic Federation of Holland, branch secretary at Amsterdam in 1891, member of Central Executive Board in 1892, its secretary in 1893. He retired from the federation in 1894, because of its leaning toward anarchism. One of the founders of the Social Democratic Labor Party in 1894. In the general strike of 1894 he was secretary of the strike committee; he led the men to victory, and was appointed president of the union and editor of its paper. The union grew from sixty members in 1894 to 8,200 members out of a possible 8,500 in 1906; the hours of labor, which in certain factories were from twelve to fifteen per day, were reduced in those same factories to seven and nine hours per day; the wages being at least doubled, in many cases trebled and quadrupled. The diamond-cutters are now the best-paid workers in Europe. In 1903 he founded the International Federation of Diamond Workers, and in 1905 the National Federation of Trade-Unions. For several years was president of the executive board of the Social Democratic Labor Party and editor of the Social Democratic weekly paper, *De Nieuwe Tyd* ("The New Era").

TABLE OF PLAYGROUNDS IN AMERICAN CITIES

| CITIES | School population | Playgrounds | | | | Appropriation from city | Average number of children in attendance |
|---------------|-------------------|-------------|---------|--------|-------------|--------------------------|--|
| | | School | Park | Public | Private | | |
| Atlanta | 15,000 | | several | | | Not fixed. | Movement new |
| Baltimore | 67,000 | 17 | 7 | | | Use of school buildings. | Movement new |
| Boston | 98,000 | | 17 | | | According to need. | Not given |
| Buffalo | 52,000 | 2 | 1 | 3 | 1 | 6 supported by city. | 1,000 |
| Chicago | 272,000 | 90 | 4 | 4 | 3 | School and city funds. | 15,000 |
| Cincinnati | 131,000 | | 2 | 2 | 3 | According to need. | |
| Columbus | | 3 | | 4 | | For part of cost. | 1,300 |
| Denver | 46,000 | | 7 | | | Total cost. | |
| Kansas City | | | 3 | | | Part of cost. | |
| Minneapolis | | 5 | | | | For equipment. | 700 |
| New Orleans | 96,000 | | | | | | |
| New York | 627,000 | 76 | 13 | | 4 | Nearly total cost. | 10,000 in parks; 23,246 in school yards |
| Philadelphia | 271,000 | 36 | 4 | | 1 | 95 per cent of cost. | 23,897 |
| Pittsburg | | 9 | 2 | 2 | | \$5,000. | 3,985 |
| Portland, Me. | | 2 | 1 | | | Part of cost. | 150 |
| Seattle | 24,000 | | 2 | | | | |
| St. Louis | 199,000 | 6 | | 1 | | Use of school yards. | 3,565 |
| St. Paul | 27,000 | 2 | 1 | | | \$10,000. | 8,835 |
| Washington | | 13 | 2 | | 3 | \$35,000 by Congress. | 5,000 |
| Worcester | 21,000 | | 8 | 12 | ball fields | Part of cost. | |

He was appointed by the government in 1899 a member of the Central Board of Statistics, and elected in 1902 municipal councillor of Amsterdam. From 1900 to 1905 he was president of the Chamber of Labor in Amsterdam. Mr. Polak is a Marxian Social Democrat. He has translated Sidney and Beatrice Webb's "History of Trade-Unionism and Industrial Democracy," and most of Robert Blackford's works. He himself is the author of pamphlets on anarchism, trades federation, trade-unionism, and labor legislation and kindred subjects. Address: Fransche Laan 9, Amsterdam, Holland.

POLICE: The policeman is far more than a guardian of the public peace. Mr. Thomas Byrnes calls him "the real court of first instance." Says Mr. H. M. Boies ("Prisoners and Paupers," p. 237):

In the United States, under a social organization for self-government, a government of laws, which are solely the formulated decrees of popular judgment and will, the police and constabulary constitute almost the only incorporate and vital evidence, or general manifestation, of the authority and dignity of government; they represent the concrete absolutism of the laws, and exercise the majesty and power of the people in among, and before the people constantly. They become, therefore, to the people here, not only the agents and representatives of self-government, but the express force and soul of government, the general and popular conception of government itself. This increases the power, dignity, and influence of the police officer in this country immeasurably above what exists elsewhere. It is his province here to bring the popular power into direct contact with and control over the people. . . . The police are, in this country, the eyes and ears, as well as the hands, of the body politic; not only the means of governmental apprehension, but of discovery; the agents of prevention as well as of cure. It devolves upon them to observe the very beginnings of error, failure, and sin in society; to note the sources, the inception, and conception of crime and poverty; to watch their birth, growth, and development; to become familiar with causes and occasions; to recognize the necessary remedies. They seldom feel called upon to interfere; indeed, the principle of their action is not to interfere before the overt act, when correction becomes necessary and prevention is no longer practicable. The intimacy and constancy of their contact with society and its elements should enable them to stretch out the helping or the warning hand of government when it could be efficient, when the needed slight change of direction can be given the individual faced the wrong way, before the club, the handcuff, or the lockup have become necessary. Indeed, an interference which would be resented from a private person, however gently or kindly made, would be received not only without objection ordinarily from the policeman, but it would carry with it the weight and influence of the wisdom and will of society. A word or an act which would make no impression without authority, with it might be effectual in saving many a youth from ruin. If the police then could be enlisted as conservators of morals as well as preservers of the peace, they would become a power in the community of inestimable utility, and the necessities of their harsher activities would be greatly decreased. The task of training the twig is lighter than bending the tree. If they could be made to devote their chief care to the children and youths when they are beyond the parental eye or control, and be placed in a position representing with authority the organized parentage and domesticity of the community outside its homes, upon the streets and in public places, many of the dangers of city life would be alleviated. Their parental functions might be extended for the general benefit to the relief of the poor from suffering, to the ministrations of charity, to the restrictions of intemperance, the arrest of drunkenness, the correction of evil tendencies, and the rescue of those in peril of moral corruption and ruin.

On the other hand, what the police can do, and too often do, for evil is shown by the following account of the political situation in Chicago, by George K. Turner (*McClure's*, April, 1907):

The City Council of Chicago, in the paroxysm of excitement over the reign of crime of a year ago, voted for 1,000 new policemen, most of whom have now been added to the force. It was asserted then that there were not men enough to protect that great and wide-lying city. This was certainly true, but it was an understatement of the case. The exact condition was stated by Captain Alexander R. Piper, an expert who, with Roundsman William F. Maher, of New York, made a special investigation of the Chicago police in 1904. He said in summing up: "It is not necessary for me to tell you that you have practically no protection on your streets. You all know it, and you know how seldom you see an officer

at night. Your patrolmen pull the box on the hour or half-hour and then lounge in their holes or some saloon." These conditions exist to-day.

The reason for all this is clear. The business of dissipation, working through ward politics, has bought the protection of the Chicago police force. This fact necessarily deprives the police force of its usefulness to the public. The officials who are "Protection" actually receiving pay for granting protection are in a combination to break the law. This combination extends below them to a certain extent into the department; and it encourages, of course, every patrolman who is at all dishonest to break or help to break the laws. Various members of the force have, in the past, formed alliances with criminals; and the relation was so close with them that patrolmen have actually arranged burglaries through professional craftsmen. The force itself contains also quite a number of criminals: men who have been convicted from time to time of crimes ranging from shoplifting to burglary. Indeed, it is a fact that criminals, attracted by the possible chances of profits, are continually trying to get into the department. In a recent call for 450 men, thirty-five applicants were found to have criminal records. Of course, there can be no discipline under these conditions. There is, as Roundsman Maher said, practically no patrolling. There is continual loafing on the beat, with petty grafting down at the bottom of the department. The condition of the department is summed up in the statement, that in two years, 1904 and 1905, over half the force was before the police trial board for one cause or another. . . .

The system comes about very simply. The influence of the ward bosses in the districts of dissipation secures from the administration the police officials they desire. These officials see that the men under them carry out the business agreements which they themselves make with the leaders of the ward. If a new policeman does not enter into relations with the system or acquiesce in its working, he is "jobbed." That is, by various technical charges against him by his superior officer, he is kept under continual suspicion and finally either shipped off to some outlying district of the city or even discharged from the department on trumped-up charges. The Chicago department is now under civil service and has been for ten years, but this effective and simple method makes it possible to beat the civil-service rules and to organize the force so that the required protection can be guaranteed to the interests of dissipation. Inside the department there is either an astonishing fear of this system or a loyalty to it that is simply amazing. . . .

There must be, at a conservative estimate, \$200,000 a year paid over to the police, for protection to the business of dissipation. Just where that money goes into the department is, of course, almost impossible to tell. It is a matter of fact, for instance, that the gambling squad—eight or ten men under the personal command of the chief of police—sit and watch the operations of "handbook" makers and even bet themselves. It is also a fact that when personal information has been given to the chief of police concerning a betting-place, that place has been perfunctorily raided and has been in operation again a half-hour after this was done. But it would be impossible to demonstrate from this evidence that the present chief of police was paid to protect gambling in Chicago. It is true that criminal saloons and houses of prostitution have an understanding with the police that they may violate the law until some one protests, and that then they will be notified by the police and kept in touch with the situation until it is advisable for them to resume the practices which are objected to. But who gets the pay for this and what the pay is, has not yet been determined with legal exactitude. It is worth while, perhaps, as showing the possibilities in the case, to recall that one ex-chief of police said, in a burst of confidence, that he had put away \$187,000 during his few years of office.

With this view of the possibilities of the police for good or for evil, we come to a consideration of the facts and statistics of their organization.

The origin of the police system seems to have been twofold, military and judicial. France, as early as the fourteenth century, seems to have had a military police, the basis of the French *gendarmerie*. In England the origin was characteristically judicial, beginning with parish constables controlled by the justices of the peace. Paris by 1800 had an organized force of seven or eight hundred men. London, however, is said to have had the first modern police force, in 1828. New York, in 1841, had 34 constables (for 17 wards) 100 marshals, 300 night-watchmen, 100 wardens, bell ringers, etc.

The following table gives recent figures:

Top

In Great Britain the total police force is: England and Wales (1905), 45,202; cost, £4,321,132. Scotland (1904), 5,307; cost, £547,521. Ireland has an armed constabulary of over 10,000 men.

In London the commission consists of a chief and his assistants, appointed for life by the king on the recommendation of the Home Secretary. The Metropolitan police is composed of 16,846 officers and men, for which the annual appropriation is over \$8,000,000. There is also the police of the city consisting of 1,056 men.

Europe

In Paris the organization of the police is distinctly military, under a prefect of police who is under the Minister of the Interior. The prefect occupies almost a cabinet position and resigns after a conspicuous failure, as after the students' riot in 1892, and the assassination of President Carnot. The number of men belonging to the municipal police of Paris is 8,000, and the total annual expenditure over \$8,000,000. There are also "indicators," or spies, usually reformed criminals.

In Berlin there are many kinds of police, all in military organization under the Minister of the Interior. The force is divided into two departments, the day-watch and the night-watch. The municipal authorities maintain besides a force of night-watchmen, whose duty is chiefly to protect the property of the citizens. The Berlin force consists of 4,500 policemen, and the expenditure is \$3,000,000.

The police of Vienna is composed of 3,500 officers and men. In Glasgow there is a force of 1,347 men. On the Continent of Europe the police are usually armed with swords and revolvers, and mounted officers are much more numerous than in the United States. In some cities, as in Paris, the police commonly carry muskets with fixt bayonets when on guard duty.

In Russia the police are the executive administrators of the empire, and their number is unknown. There are about 10,000 in St. Petersburg. Many of them are detectives, or the famous "Third Section." They are unarmed, but carry whistles.

It is estimated that there is one policeman in Chicago for every 583 persons; for every 454 persons in Boston; every 451 in Philadelphia; every 434 St. Louis; 406 New York; every 475 in Vienna; 471 Berlin; 355 Paris, and for every 253 persons in London.

In Ireland, Egypt, India, Australia, the police are under the control of the central government.

Concerning the evils of the present police system in American cities, it must not be forgotten that besides the political and administrative corruption of the police of which we hear so much, there are other evils of which we do not hear. Their task is often arduous and the need of good judgment very great. Not too much must be expected. Said an old soldier in mitigation of his drunkenness, "You cannot expect all the civic virtues and temperance included for \$13 a month." The same, tho to a less extent, since their pay is higher, might be said of the police. Many of them do discharge their difficult work with great faithfulness and surprisingly good judgment. One cannot understand the difficulties they meet without close acquaintance, and a closer acquaintance often shows that many of them are far wiser than the public

Need of Reform

knows. Yet it is equally true that many of them are ignorant, inefficient, simply bullies in uniform. They are often brutal, and the terror of the weak rather than a terror to evil-doers. Mr. H. M. Boies ("Prisoners and Paupers," chap. xiv.) considers what may be done for the improvement of the police system. He argues for a carefully selected personnel, men of good health, morals, and judgment, appointed for life on good behavior. The force should be firmly instructed, carefully drilled and disciplined, to develop unity and *esprit du corps*. Ordinarily, one policeman to 1,300 men he thinks enough, with a thorough system of intercommunication, all under the control of one wise chief, and well supported by the public. Says Mr. Boies:

Humanity, philanthropy, and religion must follow the policeman on his mission with an untiring and increasing care, both for his own sake and the success of his effort. Counter attractions must be opposed against the special allurements to which he is exposed. Pleasant resorts must be provided for his off-duty hours, where the better things of life may be contrasted with the debasing pleasures with which his duties make him familiar, and intellectual and moral influences may be brought to bear upon his character. Particular effort must be made to keep up his connections with all the higher influences of social life, with the educational and religious enterprises of the people.

POLITICAL ECONOMY (see also political economists under their names): Economics, or political economy, has long been in such an unsettled state that it seems best in undertaking a statement of its position, for the present purpose, to pay little or no attention to its specific teachings, but, instead, to direct attention to certain aspects of its historical development which reveal its fundamental character and constitution as a science. Economics, it must be admitted, is not of high report either with the general public or with leaders in other fields of thought, at the present time. The latter, especially workers in the material sciences, are not infrequently heard to declare that political economy is not a science in the modern meaning of the term, and that it is discredited by its adherence to old-fashioned methods of thought. Such criticisms are too serious, particularly when uttered with the weight of authority, to be taken lightly by either the professional economist or the student.

Few things stand out more prominently in the history of nineteenth-century thought than the change of attitude which the material sciences have experienced. It is sometimes said that modern science is "realistic" and sets a greater store by facts as facts. But the older sciences were certainly not indifferent to facts; all science deals with facts. What distinguishes the latter-day sciences is not the insistence on facts, but rather the dispassionate habit of presenting and construing them. Substantially and briefly, it may be said to be a change of spiritual attitude. For modern science, the matter-of-fact habit of mind is everywhere and always decisive. Instead of seeking to find the hidden or deeper (spiritual) meaning which underlies appearances, modern science is content to present things (phenomena) as causally related, in some sort of a material sequence. This is the evolutionary point of view. Helped on by the evolutionary concept of process and the notion of cumulative causation, a large part of the discipline of the

material sciences has been devoted to purifying the scientific mind of the metaphysical animus.

How far the science of economics has adopted the new conceptions and the new methods is clearly a matter of such vital interest as properly to suggest the course of the historical review to be undertaken here. Political economy has changed its theoretic constitution from time to time in the course of its modern history and it will be profitable to inquire under the pressure of what exigencies or the stimulus of what impulses the modifications have taken place, and whether they have been in the direction of progress.

For the purpose of understanding the theoretical constitution that political economy has had during the greater part of the nineteenth century, it is necessary to go back to some of its eighteenth-century antecedents. To the physiocrats belongs the credit of having attempted the first great comprehensive synthesis in economics, and, though the structure they erected was airy and fantastic, it served as a model for later generations beyond what has ordinarily been admitted. Many a later thinker is of closer kin to them than he would be willing to acknowledge.

Until the physiocrats entered the field, economics was habitually treated as an art, the chief concern of which was to formulate maxims of public policy. With the physiocrats the study takes a new direction or what to all appearances is to be rated as a new direction. They set out to discover the natural laws of wealth, tho to the physiocrats natural law means something different from the empirical generalizations of later science. Theirs is a metaphysical conception of natural law and theirs is the metaphysics

Physiocrats of the order of nature. Starting from this as their central position, they work outward to the laws of society. The natural order of society is to them a simple deduction from the physical order of the universe, and the natural laws of society are simply the laws of the physical order applied to social relations. Therefore, the physiocrats address themselves to a careful scrutiny of nature's processes. As they conceive the matter, it is the ceaseless exchange of matter and force between nature and society that makes up the natural life of society. That exchange is the phenomenon to be explained and the order of nature explains it. The ultimate term of the physiocratic formulation of economic knowledge is, therefore, the order of nature. The habitual effort to reduce all things to terms of nature is the characteristic feature of their thinking.

Nature is invested with a teleological propensity, working for the physical welfare of man. She can, however, be hindered or even thwarted, and has been. But as soon as men cease the infractions of her discipline, the natural course is resumed. In the end, nature always has her way and her way is the best possible way, for she is the interpreter of the Supreme Legislator whose laws are intended to secure the welfare of man.

Such is the physiocratic view of the order of nature. Starting with this conception, they set about to formulate the laws of wealth, the aim being to construe the economic process in terms of the natural order. And since the great enterprise in which nature is engaged is the support and perpetuation of human life, it follows that the supreme test of economic reality is the relation of anything to this nutritive function of nature. Man's work is to be rated as efficient

or otherwise according as it helps or hinders the consummations of nature's substantial end. Thus in the physiocratic analysis the interest centers chiefly in production and their economy is, therefore, mainly a theory of production. Specifically the test of productivity of any activity is its bearing upon the fund of human sustenance—food. Only such activities as enlarged the supply of food are accounted productive—all else is beside the mark. Nature is not solicitous for the spiritual welfare of man, so no alleged spiritual gains coming from diversion of industry from its true channel can compensate for the losses of nutritive material. From this principle follows by logical necessity the physiocratic theory of the "net product," the *impôt unique*, their classification of industry and their predilection for agriculture. The system is one of singular symmetry and nice adjustment of parts.

Their theory of value presents itself as an integral part of this closely compacted system. If value be conceived to mean that which avails toward some admittedly adequate end, then for the physiocrats value must mean that which avails toward nature's work. Exchange values, those which result from the conventional rating of things, manifestly could not satisfy the physiocrat's sense of reality. Natural values are real values to be arrived at through an appraisalment of things from the point of view of nature's purposes. Only that is accounted of value which contributes to the increase of nutritive force. Nothing could be farther from the physiocrat's notion of wealth or economy than to make vendibility the attribute of wealth. That would have been a degradation of the science to the position of a "market philosophy."

Other features and details of the physiocrat's theory lend themselves to a similar construction, but enough has been said to indicate how the metaphysics of natural propensity shaped the theory and to justify the view that economy made its *début* as a systematic science under the patronage of the eighteenth-century metaphysics of nature.

It gives, however, a very faulty idea of the *significance* of the physiocrats to represent them as mere system-builders. For them the distinction of a later day between art and science has no existence. Theirs is in truth a utilitarian science—a sort of economic sociology in which of necessity the *is* and the *ought to be* are merged in one. Under the *ordre naturel* whatever is of right *ought to be*.

The next important advance in economics is connected with the activity of Adam Smith; and it is to be rated the most considerable advance ever accomplished for the science by any single individual. And his work is to be rated as a great achievement whether we regard the body of its specific teachings or whether we regard only its larger features as set forth in the general attitude of the author. The painstaking scholarship that has been brought to bear on the history of economic science in recent years has shown Adam Smith's indebtedness to his contemporaries to be greater than was once supposed.

Particularly close is Smith's kinship with the physiocrats—so close that with the lapse of time there seems to be increasing disposition to group him with them, rather than to set either them or him apart from the direct line in tracing the pedigree of the science. With both, the fundamental

constitution is metaphysical, and with him, as with them, the metaphysics is the metaphysics of natural propensity; with this difference, that in Adam Smith the metaphysics is toned down somewhat and is made to play a less overt part in shaping the formulations of theory, which is, perhaps, only another way of saying, with just about that difference that we would expect between a representative Frenchman of the eighteenth century and a representative Scotchman. Indeed, in this respect, Adam Smith may be said to occupy a transitional position in the history of economic thought, if the greater prevalence of the matter-of-fact habit of mind may be taken legitimately, as broadly describing the cultural advance of the nineteenth century. The sources that fed this advance in Adam Smith need not detain us. It is probably to be set down to the credit of no single influence or individual. He simply shared in the change of mind that was being operated for British eighteenth-century thinking by the slow-working influences of the time, and that found their most definite philosophical expression in the skepticism of David Hume. So that an admirer of Hume might be pardoned for thinking that Hume did for political economy a service somewhat analogous to what he did for philosophy. However, so far as he was hard-headed and factual he was a child of his time; but so far, again, was he also child of his time as he preserved, along with the new habit, the metaphysical bias from which it was not given his century to shake itself free.

The feature of Adam Smith's thinking that is here under notice as marking an advance in the progress of the science may be viewed in another aspect. There has been not a little discussion as to the method of investigation followed by Adam Smith. Spokesmen for each of the rival methods—"induction" and "deduction"—have each claimed Adam Smith on their side. But all that this means is that Adam Smith is in his ways of thinking at a transition. So far as the deductive method goes with the metaphysical way of handling things, the abundant use of it by Adam Smith shows the vitality of the metaphysical animus; and so far as the inductive method is a suitable companion of the more matter-of-fact habit, Adam Smith's frequent resort to it points to the presence of a new item in the conceptual equipment of the science. For this reason it is a matter of some difficulty to define Adam Smith's true attitude.

Adam Smith, like the physiocrats, is concerned to find the *natural* laws of wealth, and his discussion runs almost habitually on the causal sequences of things, and so far justifies the title of his book, "An Inquiry into the Nature and Causes of the Wealth of Nations." But a closer examination shows that, in his handling of the phenomena of wealth, he is not content to let the inquiry stop with the description of proximate causes. His feeling for reality is not appeased until the causal material situation is resolved or, at any rate, is resolvable, into its ultimate spiritual causes; in other words, for him things must have a meaning beyond what the naked situation yields. His plan, therefore, like the physiocrats', demands a scheme that shall be competent to exhibit the significance of the economic processes. But, while this much may be said with confidence, it is not so easy to say what that scheme is. It is not put forth with the physiocrats' naïve frankness. Adam

Smith is a Scotchman. Suffice it to say that to the older notion of a teleological trend in the course of events, Adam Smith adds the notion of a normal human nature. The human propensity to "truck, barter, and exchange" becomes the mechanism through which the "invisible hand" of nature accomplishes its purposes, and since men are pretty much alike, the mechanism is well-nigh faultless. It is, therefore, the workings of human nature as thus conceived rather than the operations of physical nature that is the object of Adam Smith's analysis. His system, like the physiocrats', is mainly a theory of production, but man, not nature, is conceived to be the central agent of the process. His system has, therefore, been properly called the *industrial system*, for human industry-labor is its efficient principle, the term in which economic knowledge is formulated. Tho he looks in much the same direction, his outlook is broader than the physiocrats'. Everything is viewed from the standpoint of production; all the economic processes are construed as aspects of the productive process, but the notion of production is widened so as to include every variety of industry, not alone that which helps the nutritive work of nature. So "natural" value belongs to whatever embodies labor; labor is the *cause* of value—the "real price" of things.

But while Adam Smith's notion of the natural course is appreciably nearer the truth, as the ordinary layman sees it, than was the physiocrats', it is very far from professing to be identical with the actual course. Thus natural values are not the values causally determined by the "higgling of the market." But, for all that, they are the "real," the "necessary" values, and the market values are the nominal values, the "accidents," tho a cynic might be pardoned for refusing to see wherein they were "necessary" except to establish the logical congruence of economic theory with its postulate. Of course, the gap between nature and the market is bridged, in thought at least, by the workings of self-interest. Where competition is the regulator of values a reasonable correspondence is held to ensue between the "real" and the "nominal prices" of things, and thus is vindicated the economist's claim that nature does all things well, and that, as she does them well, the logical is the "natural."

Quite as characteristic of Adam Smith's attitude is his treatment of distribution, and it is almost equally characteristic, it may be added, of the attitude of many later economists toward the same problem. The shares in distribution are to be accounted for. How is it done? Briefly stated, by construing them in terms of the "necessary" equivalence of effort and effect in production. Nature does not waste. Therefore, when the natural course of things runs off smoothly, that is to say, when competition does its part, effect must be proportioned to effort, and vice versa, and thus the quantitative equivalence between work and pay is neatly established. Man bestirs himself to secure a gain with no intention of assisting the productive processes of nature. But, for all that, the bargains that he drives betray him into an alliance with nature, and therewith is he led by the "invisible hand" to do his part in production and the service of society. The resulting shares in distribution are natural. But, here again, it must not be supposed that the natural and the actual correspond

in Adam Smith—least of all in that state of actual society which follows "the appropriation of land and the accumulation of stock." Nevertheless, the distribution in question is "natural," because it falls in with the author's preconception of the orderly course of industry.

If it be asked whether the term "natural," as employed by Adam Smith, implies the same unmitigated approval as with the physiocrats, the answer must be "no." In general, the "natural" means "what ought to be," or "what is intended by a benevolent providence." But some telling passages might be quoted to show that Adam Smith's enthusiasm for the "natural" is considerably tempered by his noting the action of other plain, homely, matter-of-fact causes, even under the "system of natural liberty." The case of the landlord is one. His "rent costs him neither labor nor care." So again "the interests of the dealers in a particular branch of trade or manufactures is always in some respects different from and even opposite to that of the public." The persistence of these and similar cases were troublesome items in Adam Smith's system. They must have offended his nice metaphysical sense of reality. But it is greatly to his credit that he did not attempt to ignore them and was willing to sacrifice symmetry to truth. That would have offended his dispassionate practical judgment still more. He is willing to let these blemishes stand as exceptions to the beneficent trend of things. And in this respect he is better than some of his followers.

But yet, looking backward, the metaphysical animus in Smith is strong. The notion of a natural economic order guided his thinking as it had done the physiocrats'. But his natural order was the result of the free and spontaneous action of individual interest, acting, of course, under the constraint of providence. This idea of efficient self-interest was his specific innovation and his legacy to his followers. They seized upon it, and, informing and strengthening it with a new philosophy of the human mind, made it the basis of the classical system.

With the turning of the century, the constitution of economics experiences a substantial change, adding to its premises and shifting its attitude, but not in any such thoroughgoing way as to divest it of its metaphysical character. It is still a science dependent on the apparatus of preconceptions and postulates.

The leading figures in economics at the beginning of the century are Malthus and Ricardo, and they, with Adam Smith, are usually represented as the great triumvirate that gave to English political economy the character that it has held ever since. But it seems doubtful if either Malthus or Ricardo has exerted a greater influence than the great utilitarian

who was the tone-giving influence in nearly every department of English thought for at least one half of the century. To the influence of Bentham's teaching the science owes that peculiar constitution which has given rise to its characterization as "the mechanics of natural liberty." To that same influence seems due the shifting of the center of interest from the analysis of production to the theory of value. And to his teaching in particular we owe the creation of that bondman of the science, the economic man. To him also is due the rapid rise to ascendancy of the abstract deductive method. No doubt, other

influences also contributed to these changes. The incorporation of the law of diminishing returns and the principle of population into the premises of the science are to be especially noted. As limiting conditions of the environment within which the economic action of man was noted, they, also, served to add emphasis to questions of value and distribution and besides imported a strain of pessimism into economic thinking. But no other influence was paramount to the influence of the new habits of thought, the foundations of which were so convincingly set forth in Bentham's "Principles." That influence was deep and pervasive. It was during the reign of Benthamite utilitarianism that English political economy achieved its greatest triumph and worked its way to an authoritative position in Great Britain as a foundation for public policy. How intimately associated in the public mind were utilitarianism and political economy is seen in Carlyle's writings where the monster "Utilitaria" and the "Dismal Science" are represented as different faces of the same vicious error.

The specific innovation that utilitarianism accomplished for political economy was the substitution of utility for providential design as the basis of theoretical formulations. Bentham gave to that metaphysics of human nature which had already emerged in Adam Smith, a matchless statement, an impregnable setting. It became for political economy a first principle. Adam Smith had shown how the actions of individual men, each seeking his own gain, inevitably promoted the public interest. But Adam Smith was no utilitarian. It was to only one class of actions that he assigned self-interest, and even there self-interest was but a wheel in the mechanism through which nature sought her ends. With the school of Bentham, however, "there is no true interest but individual interest," not only in the region of business but throughout the whole of life. Self-interest is, therefore, not a method of nature: it is nature.

To Adam Smith's followers, the "Wealth of Nations" was a sacred text. But like other sacred books, it needed interpretation. At the opening of the century the succession to Smith was in question. Malthus and Ricardo were aspirants for the leadership. Of the two, Malthus stands much nearer Smith in his philosophical preconceptions than does Ricardo. Like Smith, he imputes a purpose and constraining guidance to nature. But the victory went to Ricardo. He is a layman in philosophy, coming by his preconceptions tacitly, like many a later economist, through a simple process of absorption. That is, perhaps, what makes him so significant an exponent of the change in the point of approach that was taking place in the science. Ricardianism is Benthamite utilitarianism turned economic. It was given to Bentham to formulate the new articles of faith, to Ricardo, to use them.

In the hands of Ricardo and the disciples of Bentham, economics ceases to be a theory of the natural order and becomes, what was already foreshadowed in Adam Smith, a theory of the workings of human nature, but of human nature construed in hedonistic terms. Human nature is regarded as a competent mechanism for transforming the effects wrought upon it by the environment into an equivalent amount of conduct. Human action is viewed as inert, mechanical reaction, the effect in conduct being always quantitatively proportionate to the cause. This being

the general position of hedonism, the particular office of each of the sciences living under its dispensation was to show in detail, in its appropriate department of activity, how this reaction takes place. And since the process through which the human agent translates the adequate cause into its appropriate effects is obviously a valuation process, economics ceases to be primarily a theory of production and becomes a theory of valuation. Its principal problem is not to discover the causes of the productiveness of industry, but, as Ricardo puts it, to "determine the laws which regulate distribution." Value ceases to be regarded from the side of production and production becomes a category of value, and political economy takes a long step toward attaining, in appearance at least, what Professor Marshall three quarters of a century later describes as its proper goal—a theory of the equilibration of economic forces. In keeping with this change of base, value is no longer conceived as that which avails toward production, but as that which avails toward exchange. Labor falls from being the cause of value to being merely its measure. Value being taken as the earmark of wealth, the Ricardian economics becomes a theory of acquisition, attention being given to the money-making propensities rather than to productive activity. The distinction between industry and business, between the making of things and the making of money, is obscured and neglected. Archbishop Whately designated the essential interest of the utilitarian economics when he proposed the name "catalactics"—the science of exchange. However considerable the changes thus wrought in the theoretical structure of the science, the adoption of the utilitarian conception did not destroy or seriously damage the belief in a meliorative trend in events. The facts of diminishing productiveness and the law of population made it far from easy for the Ricardians to contemplate the "natural advance of society" with the unmixed satisfaction of the physiocrats and Adam Smith. But utilitarianism with its "greatest good of the greatest number" and "every one to count as one," saved the day for the system of natural liberty. Since society is the sum of its individual men, and the collective interest is the sum total of individual interests, it follows for utilitarian economics that each individual in pursuing his own private interest is also furthering the social good in the most effective fashion. And consequently the natural laws of the science under its utilitarian organization, tho they have lost something of their former coloring and unimpeachable authority, are still uttered in a sense that usually applies approval even tho in a greater degree than before they are exprest in the conventional language of science. Competition makes for the happiness of the greatest number. Therefore, the natural laws of political economy, which are the laws of competition, carry with them the suggestions of precepts.

So long as utilitarianism maintained its position unimpaired, economic science had a clear and easy course to follow—that is, until about the middle of the nineteenth century. During that time, it advanced to a commanding position among the social sciences because it was, of all of them, the most competent to turn the utilitarian expedient to effective account in explaining the motions of men and society. Its deliverances, tho frequently uttered in a spirit of dogmatism,

were accepted almost unquestioned. Its standing with the public had never been better. There were differences among the Ricardians on questions of theoretical detail, but nothing touching the spiritual stability of the system they had devised. New departures in economics were taken or proposed by Sismondi in France, List in Germany, and Richard Jones in England. But highly valued as the work of these innovators has been by later economists, it made little impression upon the development of the science at the time. The authority of the classical political economy was not impeached and could not be impeached by any such attack. The time had not yet come. So long as utilitarianism was in the ascendent, the public credentials of political economy must needs be the best. But let the supremacy of utilitarianism once be threatened and troubles must begin for economics. The old constitution would no longer avail; a change must follow.

That change began about the middle of the century and, strangely enough, was associated with the intellectual enterprise of one who frequently has been represented as having given to political economy its most telling exposition from a clarified Ricardian standpoint—so much so, that the English economics of this middle period has sometimes been called the Ricardo-Mill political economy. But seen in the

John Stuart
Mill

fuller and truer perspective of time, Mill's "Political Economy" is read to very little advantage, and his position is very badly understood, when he is represented as merely the "Secrétaire de la Rédaction" keeping to his task with the "piety of a disciple." The truth of the matter is that Mill was at a transition in British thinking in a sense which neither he nor his following appreciated. In his hands political economy was shifting its ground insensibly, perhaps, but nevertheless unmistakably. Mill may have echoed the laws and phrases of the earlier generation of thinkers, but he was informing them with a new spirit which reflects the presence of the new influences that were effecting the thinking of his day. This is not the place to attempt an enumeration of these influences. They were several and diverse. It will answer the purpose to mention a single one connected with the decline of utilitarianism and its psychological counterpart. For this decline imparted a considerable change in the outlook and status of economic science. The change in question is already foreshadowed in Mill's "Logic" (1843), where the older view that individual conduct and character are but the mechanical product of the molding circumstances of the environment is qualified so far as to allow to the individual himself an influence and responsibility in shaping those circumstances. That is to say, a teleological trend is coming to be claimed for individual conduct where formerly such a trend was looked for and found only in the sequence of events in nature. In other words, the human nature, into the workings of which the economist inquired, is being differently construed under the guidance of a changed psychology. The psychology that was making its way in Mill's time was moving away from the older associationist standpoint and approaching the position of modern functional psychology. Centering its interest in the process of attention, it teaches that cognition or perception as the attentive process: always implied the presence of a purpose or in-

terest that elicits and guides the attention. That attention is essentially the process of examining a situation with the view to discovering what objects and conditions it contains that may be made use of for a given intended purpose. Human conduct, as viewed from this standpoint, ceases to be merely uniform, quantitative, inert reaction to adequate forces, and comes to be regarded as qualitative, purposive response to stimuli. The ethical counterpart of this revamped hedonism, the utilitarianism of Mill, correspondingly recognizes in the motivation of human conduct differences in kind as well as amounts of pleasures, and imputes to the selective agent in conduct a continuity of purpose that gives a spiritual stability to the life process. And herewith there begins to fall away from political economy that ancient article of faith which had seen in nature, and nature alone, that consummate, beneficent trend which enabled the economist to go to his work with conviction in his heart and confidence on his lips.

It is out of the question here to pursue the modifications wrought by Mill and his following in the received version of economic doctrine as a result of the change in their spiritual attitude. To one of these, though it is far from being the most significant, Mill himself calls special attention. It is the distinction he draws between the laws of the production of wealth and the laws of its distribution. The first are "real laws of nature dependent upon the properties of objects" and cannot be modified; but the second are only the "necessary consequences of particular social arrangements," and are "liable to be much altered by the progress of social improvement." And any attentive reader of Mill will recall many instances in which the outcome in the economic situation is represented as controlled or modified by other forces than mere pecuniary interest. The economic situation is far from frictionless. The many circumstances that Mill finds impeding the indiscriminate play of human competition, as, for example, in his discussion of the cause of differences of value or differences of wages, are cases in point. The "counteracting forces" as well as the "controlling principles" are noticed. It is the "negligible factors" that mar the symmetry and glow of his exposition. For similar reasons the unmitigated results of gain-seeking traffic are not necessarily to be construed as good, and competition loses something of its former virtue as the natural scheme of social salvation. There is a visible shrinkage of the teleological content of the laws of political economy. They imply less of approval than formerly, of the competitive process of which they are presumed to offer the explanation. They are still natural laws but with more of the limitations of later-day science—empirical generalizations, statements of impersonal uniformities, of coexistence and of sequence. Moreover, they are abstract laws built on assumptions and of hypothetical validity only. They are not entitled to exercise, therefore, a narrowly constraining influence on the economist who undertakes to apply them. Hence, Mill does not hesitate, in applying the principles of political economy to social philosophy, to propose some very substantial departures from what so many of his predecessors had been disposed to regard as a sovereign, natural principle of the science—the principle of *laissez-faire*. For Mill the "admitted functions of government embrace a much wider field than can easily be in-

cluded within the ring-fence of any restrictive definition; and it is hardly possible to find any ground of justification common to them all, except the comprehensive one of general expediency." Liberty and property cease to be "natural rights" and are treated as human contrivances to be tried on their merits. To the emancipated mind of Mill's day, Bastiat's "Harmonies" was an anachronism, a voice from the past. Cairnes's impatient declaration that political economy has nothing to do with *laissez-faire*, shows how changed was the animus of the science.

Clearly, then, the forces of disintegration were at work in political economy and the constitution of the science as it left Mill's hands was a different thing from what it had been in the confident days of his father. When Cairnes some years later undertook to rest on the prestige of political economy by a guarded restatement of its leading principles and explanation of its character and methods, he believed himself, no doubt, to be walking in the footsteps of the masters. But the net result of his effort was to show how far political economy had drifted from its traditional position. The unpretentious character that

Cairnes

Cairnes assigns to economic laws was far from expressing the ambition of the masters. The fact is that Cairnes, in attempting to give to political economy an irreproachable character, was simply sterilizing it. He set out to do for political economy what was being done in the natural sciences. In the overhauling the physical sciences were experiencing in Cairnes's day, an attempt was being made to read metaphysics out of them, and the physical sciences were in this respect serving as an example to the social sciences. Whatever success the effort to relieve science of the metaphysical taint may have had in the field of the former, the results of the innovation in political economy are not to be accounted as highly effective. Under Cairnes's dispensation political economy became not so much less metaphysical as less vitally metaphysical. The virile and imposing metaphysics of natural liberty simply gave way to an impersonal and spiritless conception of normality, and political economy becomes what it has remained for many of Cairnes's followers, a perfect, hypothetical science—formulations of theory in terms of tendencies—a body of ultimate principles. For the average reader, Cairnes took the discussion of economics out of the older region of reality into an atmosphere so tenuous that it could not preserve the aspect of vital interest. It was a metaphysical science without a message. It was neither stimulating philosophy nor good observation. Is it then surprising that Cairnes should have complained that political economy had "ceased to be a subject of fruitful speculation with the educated public" or that Bagehot should have found that "it lies rather dead in the public mind" and that "it no longer matches with the most living ideas of people"?

It is hardly necessary to add that all this is said with no thought of disparaging the services of Cairnes's school to economic science. His is deservedly an honored position in the history of the science, and it may well be that the phase that it has seemed fit to connect with his name was an unavoidable phase in the development of the science. Indeed, there is good reason for thinking that it was. Economics was threatening to

become a closed circle and to come to a full stop. Such a condition could not, however, long endure in a subject of such vital concern. A reaction in some form was inevitable. What is matter for surprize in reviewing the history of the past fifty years, is that the reaction, in a form competent to deliver the science and give it a modern constitution, should have been so long in coming. Earnest efforts to regenerate economics and to recover for it something of its lost prestige have surely not been wanting. But the record, if the truth is told, is not one of big achievement or even of measurable progress when we consider the startling advances that have been taking place in other fields.

Looking first at the work of the economists of the last generation, mainly English and American, who have set themselves the special task of formulating economic theory, it will hold true, with some exception, that their work has been mainly work of repair and extension, rather than of fresh construction. They are the legitimate heirs of the classical tradition—the classical school of to-day. Magnify as we will the differences that separate these later theorists from their classical predecessors, the differences are differences of theoretic detail and emphasis rather than differences in point of approach or method of attack. The problems they handle are the old ones and they handle them after much the old fashion, tho, be it

Modern Classical School

said, with some change in the phrasing of their conclusions. Utility may take the place of cost and productivity of sacrifice; a single law of distribution may do the work that once required three; but we still have the problems of the Ricardian economics and the apparatus for handling them shows little change. It is still deductive economics of the old type, seeking by a skilful manipulation of definitions to explain the normal case. A perfectly balanced system in which everything is reduced to order and symmetry and congruence with itself, that is accepted as the test of truth. Such, for example, is Professor Clark's "Distribution," a consummate achievement in the art of system-making. And tho the phrase "system-making" cannot be applied to Marshall's "Principles" without qualification, it is largely because the amplitude of accessories, with which he invests his treatment, divides our interest with the system. Every competent reader of this monumental work knows how much more it contains than a system. But the Professor Marshall's practise is more liberal than his precept, he has made it clear on more than one occasion that the ideal he cherishes for economics is to place it on a firm foundation as a systematic science, seeking to establish a body of general principles—an organon, as he has called it—by those methods which the natural sciences of an earlier generation have made familiar. He aspires to make economics a perfect, quantitative science and would, therefore, keep value in its traditional position as the central problem of the science, to which and from which all else leads. The play of human motives working their way to a position of equilibrium, that is the thing to be explained. Recourse is therefore taken to the analogies of physics rather than biology and so the science remains a mechanics of human action—a study of balance rather than of growth—a theory of action, no doubt, but one in which the interest centers in the conditions that limit the play rather than in the

factors that vary it. No doubt neither Professor Marshall nor his colleagues are indifferent to those considerations which the biological and anthropological sciences of our day are pressing upon the attention of the learned world. There are too many evidences in the writings of Professor Marshall, at least, of a sincere and solicitous regard for the view-points of these sciences, to charge such neglect. He is read to poor purpose if it is not discovered how the notions of continuity and development in the movement of things have tempered and broadened his attitude. They are the watchwords of his preface. But for all that, when the analysis is once under way, it is not the notion of development but rather that of stability that shapes the discussion.

The legitimacy of systematic science is clearly not to be impugned. Science it certainly is. The history of scientific endeavors in other fields shows that such work has, at one time or another, engrossed a considerable share of the leading minds; but the later history of many of these same sciences shows a diminishing conviction of its usefulness. And those that have been most successful in detaching themselves from the discipline of philosophy have given it up as an unprofitable enterprise and have taken to other and less pretentious methods. Systematic science must lose caste, because its tentative conclusions fail to satisfy that desire for concrete knowledge of things that it seems to be the appointed mission of science in our day to provide.

If this version of the matter be sound, it cannot but be a cause for serious misgiving that so much of the intellectual energy of the economists of the present day that is being devoted to theory should have taken such a lead. It lends substance to the criticism sometimes leveled against economists by the adepts of other sciences that it is behind the times in its adherence to outworn methods in handling its subject-matter. There seems to be room, if indeed there is not great need, for work of a different type from that which has engaged the attention of the neo-classical school. Progress demands it.

And much the same may be said of the diversion created by the Austrians. However much they may have done to advance the discussion of a particular detail of economic theory, albeit an important one, their achievement is not to be rated as a serious innovation for the science as a whole. Indeed, the ready assimilation of the doctrines of the Austrians into the body of the classical economics shows how near they were in temperament and standpoint to the school they set out to supplant. The movement has apparently spent its force and the science goes on its accustomed way.

What shall be said of the historical movement? To it is usually accorded the place of chief importance in the history of the reaction. It made its appearance about the middle of the century

Historical School

with the intention of saving political economy from its unprofitable career. The movement has been variously known as the inductive, historical, or German school. It was in fact all three; historical and inductive in its professed method, but German in its essential spirit. The rise of this school is not a self-explanatory phenomenon, but it is not enveloped in much mystery. Just as the classical political economy was shaped by English utilitarianism, so the German historical economics was an outgrowth of

German philosophy. In each case economics was building on the current metaphysics of the home country. Each was a distinctive national product, and the historical movement, tho it has won adherents in other countries, has preserved up till to-day a peculiarly German character. Roscher started the movement. Reacting from the excessive *a priori*ism of English political economy, stimulated by the example of the new historical jurisprudence, and inspired by the Hegelian notion of development, he set out to reorganize economics on a broader basis. The movement that he inaugurated soon found adherents. Bruno Hildebrand followed in 1848 with his "National Ökonomie der Gegenwart und Zukunft," and Karl Kries in 1853 with his epoch-making "Die Politische Ökonomie vom Standpunkte der geschichtlichen Methode." Taken together these works define the fundamental articles of the constitution of the new historical economics. They were its confession of faith. Kries emphasized the idea of the parallel development of economic ideas and economic institutions—the idea of historical relativity. But Roscher was more ambitious; he aspired to make of economics a "philosophy of economic history" whose special function should be to discover the laws of cultural development in their economic aspects. Hegel had given to German thought the conception of organic society. According to this, society has a life history of like kind with organic nature; therefore, the process of organic life supplies the proper analogy for studying the cultural sequence. It was a part of this conception which Roscher seized on—that the cultural sequence repeats itself in cycles of "youth," "maturity" and "old age," each nation going through much the same course. The history of the past, therefore, is prophetic of the movement of the future; for history repeats itself. The laws of historical development are the "natural laws" of society. It is thus that history became the method of the new departure—history, that is to say, as officially interpreted by Hegel's formula. Seen in the light of its derivation, therefore, the historical school was as much metaphysical as historical. History was to be read with a purpose. "He," says Hildebrand, "can have no right understanding of history to whom the conditions and needs of his own time are unknown." It is the business of the economist "to discover the link which the present generation is to add to the chain of social development." The movement, therefore, from the beginning had an ethical as well as an historical import. Its self-appointed mission was to control, as well as to explain, development. It was a "*historisch-ethische Richtung*." As Held stated it, the new school "demands a conception of the science, which includes social policy"; and since, according to the German view, the State is the appropriate organ of social control, the new economics was a theory of the State and its functions as much as it was a theory of economy and its changes.

Whether the reaction thus described is to be regarded as a far-reaching and salutary reaction in the field of economic study is not here in question except so far as it has had a bearing upon the transformation of the theoretic constitution of the science. Every economist, no matter of what school, knows how much his attitude has been modified and tempered by the criticisms of the "Historiker." The "abstracter economics"

has been shown its proper place, its spiritual pride has been reduced, and it has been put, as it were, on its good behavior. Every historian as well as economist knows, too, how much history owes to the activity of the new school. If it has turned out much lumber of which nothing better can be said than that it is scholarship, it has also given some noteworthy and vital researches of the highest value. But all this and more that might be said to the same effect is beside the mark of our present interest. What has this school done, in a positive way, to give a new formulation of theory? Its earlier champions promised a rapid and radical transformation of economic science. Has that promise been fulfilled?

It may be said at once that so far as the activities of the historical school have moved in the orbit described for it by its founders it has failed to make good. Economic theory has not experienced at the hands of the exponents of the new method the reorganization of which it stood in need. Institutional history is not economic science. A narrative and descriptive account of things is not a scientific relation. The theory of institutions requires that these should be accounted for in terms of determinable cause and effect. A causal sequence implies very much more than historical succession. So far as the work of the historical school has been a search after the laws of social development, it has seldom eventuated in any more definite articles of theory than such loose and sweeping historical generalizations as, for example, Wagner's law of the increasing extension of State activity, or Held's law of the evolution of industry through the successive stages of family system, gild system, domestic system, and factory system. Such and similar guesses at "the curve of economic evolution" may be useful for the purposes of the economists who use them, but they do not make good the claim of their inventors that they "see things as they actually are"—"free . . . of all *a priori* theories." The frankly avowed preoccupation of many members of the school, with learning the "significance and appropriateness" of things, discredits their theoretical work no less decisively than it does that of the Manchester school whom they set out to supplant. The doctrines of the one are as unmistakably of metaphysical derivation as those of the other. But since historical induction seems a less competent contrivance than abstract deduction for turning a metaphysical postulate to rapid account in the formulation of theory, the theoretical output of the historical school has been notably small. Indeed, many of the school appear to have given up the profession of theory, being content to use as their working principles, when occasion arises, the body of doctrines worked out by the later economists of the classical trend. It was such a change of heart, no doubt, that made it possible for Professor Wagner, some years ago, to express such ready acquiescence in the work of Professor Marshall. It would appear, for this and many other symptoms of like effect, that the large group of economists for whom Wagner speaks—the historical proper—has abandoned the field of theory and taken to writing history.

When, however, we turn to the branch of the historical school of which Professor Schmoller is the representative, we meet a different situation. There is much in the later activity of this branch that is of capital importance for economic theory

and much that sets it apart from its own past as well as from the conventional line of the historical trend. Taking, at the outset, a position so radical that it drew from his colleagues the characterization of "extreme Historismus," Professor Schmoller yet stands to-day as one of the foremost workers in the field of theoretical construction. Whether or not such an outcome was to have been expected as a result of the interest that hitherto engaged the activity of Professor Schmoller and his school may be doubted. It is well known that Professor Schmoller began his career by discouraging all attempts at theory as premature and ill-advised until an extensive equipment of historical, statistical, and other material should have been provided, and his utterances on different occasions left no doubt that this preliminary work would need to be done with such exhaustiveness as to absorb the energy of at least one generation. An eventual formulation of results was avowed to be the end in view; but the long-continued and painstaking devotion to history, and the easy avoidance of theory, gave much ground for the belief that history rather than theory would always be their characteristic product. Indications, however, have not been wanting in the writings of Bücher, Knapp, and others, that history was not to be the last word of the school but the pathway to construction. Above all, the work of these gave substantial promise that the theory at which they aimed would not rest with empirical, historical generalizations, but would lead to laws of causal sequence. It is this latter aspect that makes historical economics, as seen through Schmoller's "Grundriss," of such significance for economic theory. The function of economic theory as Professor Schmoller understands it is very different from the conventional view. He made it clear, some years ago, in a review of the Austrian doctrines, that he could not regard the doctrine of value as the main preoccupation of economic theory. For him, the economic process includes much more, and much of more significance than the process of valuation. What he aspires to offer is a theory of institutions, more specifically a theory of the factors that have shaped the successive phases that make up the life history of these institutions, and the outcome, as we have it, in the existing situation. The economic situation, as Professor Schmoller views it, has nothing definitive about it. Institutions are always regarded as a part of the conventional apparatus of life. They are still in the making, therefore, and always will be; and they are not accounted for by representing them as functions in an orderly and rationalized scheme of things. They represent the accumulated influence of a complex of forces whose shifting play is to be ascertained by a careful scrutiny of the exigencies under the stress of which the process of adaptation has taken place. The interest centers, therefore, much more in the origin, variation, and survival of institutions and habits, so far as these determine or are the economic situation, than in their present working or efficiency as rated by some conventional standard. The result is, therefore, to be described as a genetic rather than an historical account of institutions—a natural history of institutions in their economic aspects, the chronological sequence always giving way to the causal sequence. The point of view is that of evolution rather than of "historical development," the dis-

cussion habitually following the lines that evolutionary science has made familiar. Elaborate notice is taken of such features and circumstances of environment as have an appreciable bearing upon the economic life process, and a no less careful regard is paid to the changing make-up of human nature; for it is the complex interaction of man and his environment that issues in institutions.

For such a survey of the natural growth of institutions, history is of obvious importance. It describes the field of investigation; but more than history is needed. One has only to turn the pages of Professor Schmoller's "Grundriss" to see how widely he has ranged in fields of knowledge that lie beyond the conventional frontier of economic science, as it has usually been cultivated by economists of either the historical or the classical trend. The fact that is of moment, and that is to be signalized in following the progress of our science, is that we have here a new type of economics, a type that attempts, and with much success, to carry into the study of economic institutions the spirit and method of modern science.

POLITICAL SCIENCE may be defined as that branch of social science which treats of the theory of the State. Its province is not coextensive with the investigation of society. It is concerned only with such activities of society as are organized in the constitution. "A population speaking a common language and having ideas as to the fundamental principles of rights and wrongs, and resident upon a territory separated by high mountain ranges or broad bodies of water, or by climatic differences from other territory,"¹ such is the State behind the Constitution. It presents us with the natural basis of a true and permanent political establishment, but does not constitute the subject-matter of political science. Political science studies the State within the constitution and shows how it expresses its will in acts of government. It inquires how this State within the constitution is created and molded by the State behind the constitution, but beyond this political science proper does not go. The State behind the constitution, or natural society as we should otherwise call it, is for politics, as for political economy, a datum. The detailed study of its origins and evolution falls within the province of sociology (*q. v.*). Political science, however, like sociology, finds its premises in facts of human nature. The motive forces of political life are the desires of men, but they are desires

¹ *The American Commonwealth, Political Science Quarterly*, vol. i., No. 1, March, 1886, p. 13.

massed and generalized, desires felt simultaneously and continuously by thousands, even by millions of men who are by them simultaneously moved to concerted action. Transmuted into will, these desires become the phenomena of sovereignty—the obedience-compelling power of the State—"original, absolute, unlimited, universal power over the individual subject and over all associations of subjects."¹ Political science describes these gigantic forces and studies their action. It assumes for every nation a national character and concerns itself in the political constitution of the State scientifically deducible from the assumed character of the nation. It takes the fact of sovereignty and builds upon it. It starts where Aristotle started, with the dictum that man is a political animal. Until within quite modern

Definition and Nature

times writers on political science included in their works a treatment of the topics that are included to-day under the special sciences of politics and political economy. But the whole group of subjects which these names suggest—natural rights, democracy, individualism, socialism, questions of finance, statistics, and the like—have now gathered about them a history and theory too comprehensive for any but special treatment.

Political science, therefore, strictly construed, limits itself at the present time to the discussion of the nature and functions of the State. The general topics, for instance, treated under the caption Political Science in Prof. J. W. Burgess's "Political Science and Constitutional Law," are: the idea of the nation; the present geographical distribution of nations and nationalities; natural political character; the idea and conception of the State; the origin of the State; the forms of the State; the ends of the State. Constitutional law, or the study of the concrete methods by which the State exercises its powers, is naturally a closely allied subject, but, nevertheless, in this work it receives separate treatment under such topics as the organization of the State within the constitution in Great Britain, the United States, Germany, and France; the idea, source, content, and guaranty of individual liberty; the systems of individual liberty guaranteed in the aforementioned nations; their forms of government; the construction and powers of their legislatures; the duties of the executive and judiciary.

Early writers on political science failed to make these distinctions, and their treatment of the nature of society in general, of the organization of the State within the constitution, and of the forms and functions of government, was therefore less clear and scientific than now obtains.

Historically, political science begins with the whole mass of primitive political theory.

In every community of human beings, however rude, there may be detected some form of regulating authority which determines in some degree, however slight, the relations of the members of the community with one another. Very early in the development of civilization man sought some explanation of the phenomena of authority that should satisfy the national spirit. The first results of this seeking were often ridiculous enough, in the judgment of more advanced reason, tho not more so than the earliest results of

investigation into the phenomena of the physical world. Such attempts were the beginnings of political science. Writers, however, who hold that the most satisfactory distinction between political science and the wider social science of sociology is based upon the existence of a political consciousness in a community are inclined to leave this subject of primitive ideas of authority to the latter branch of thought and begin the history of political science at that point where the idea of the State, as distinct from the family and the clan, becomes a determining factor in the life of the community. When the

Beginnings

laws of Manu in India, the sayings of Confucius and Mencius in China, the sacred books of the Hebrews and the priestly traditions of Egypt and Babylon, were formulated, they represented the culmination of a long process of the development of political ideas. The political theories of Plato and Aristotle, from which it has been customary to date the beginnings of political science, likewise were but the culmination of Greek thought on the subject—thought that had its origins in the civilizations of Cyprus and Ionia, and in the formulated ideas of the Hittites, the Hebrews, the Babylonians, the Egyptians, and their earlier intellectual forebears. The earlier ideas were inextricably blended in the conceptions known to us as legal, ethical, theological, ecclesiastical, and even mathematical. The Oriental Aryans, for instance, never freed their politics from the theological and metaphysical environment in which it is embedded to-day. The Semitic Jews and Saracens at times achieved rather more, but their achievement was not permanent. The Turanian Chinese attained a strikingly advanced position in the evolution of ethical doctrine, but neither in theory nor in practise did they ever take the further and decisive step of discriminating between ethical and political conceptions. The Aryans of Europe have shown themselves to be the only peoples to whom the term "political" may be properly applied. Hence it is that political science, in the strictly modern meaning of the term, began with the Greeks.

I. Classic Times

Political science among the Greeks was incidentally treated in writings attributed to Homer and Solon and was to some extent discusst by Thucydides, Socrates, the Sophists, and others. It was left to Plato and Aristotle, however, to place the subject upon its permanent basis.

Three dialogues, "The Statesman," "The Republic," and "The Laws," contain substantially all Plato's political ideas. Of these, the first is primarily an exercise in dialectic, and the second mainly a treatise on ethics. Only the third, the work of the author's mature years, has the deliberate purpose of dealing with political subjects. In "The Republic" the

Plato

ideal State is considered almost exclusively. In "The Statesman" this point of view is retained, but certain highly significant phases of actual government are nevertheless considered. In "The Laws" Plato formally abandons his idealism and seeks to set forth a system that would be workable among imperfect men. "The Republic" is the greatest of the three works. In it the first cause of the State is found in the diversity of men's desires and the necessity of mutual assistance in

¹ John W. Burgess, "Political Science and Comparative Constitutional Law," vol. i., p. 58. Gunn & Co., 1898.

satisfying them. A community arising from this cause embraces three classes of people: producers of sustenance, warriors to protect the laborers, and, finally, counselors and magistrates. These three classes working harmoniously together will insure the ideal State. Thus was foreshadowed the modern principle of division of labor. The ideal unity of the State is set forth in the famous discussion of communism. Private property can have no existence in the ideal State. Parents are not to know their children nor children their parents. The relations of the sexes are to be subject to the absolute control of magistrates. In education is to rest the permanent stability of the State.

On the character of the citizens, in the ultimate analysis, Plato relies for the successful operation of government. But this government is not thought of as democratic. The real State, for Plato, exists only in the abstract idea of the State; hence the real rulers are only those who possess knowledge of this idea. In "The Republic" occurs the celebrated descending series of the forms of the State, from the perfect aristocracy, through timocracy, oligarchy, and democracy to tyranny. In timocracy love of honor (*τιμή*) or glory dominates rather than justice; oligarchy is the rule of the wealthy over the many; democracy produces anarchy, and finally results in tyranny.

In general the political philosophy of Plato was largely determined by the conditions of Greek history and was the product of his judgment upon existing institutions. Of his influence, says Dunning in his "History of Political Theories":

The aristocratic city-State was the absolute limit of Plato's thought. But so fixt is the backward look of philosophy that some nineteen centuries were destined to elapse before political theorists freed themselves from the city-State idea and adjusted their speculations to the fact of systems in which the citizens were numbered by millions.

Aristotle begins with the concrete and the actual as Plato with the ideal. He is said to have analyzed more than one hundred and fifty constitutions.

From this work he drew much of the material for "The Politics." Nevertheless, the tremendous influence of his master, Plato, and of contemporary Greek thought is reflected in his theories. One of the great advances he made on Plato was the disentanglement of political from ethical conceptions. The good of man, Aristotle held, is the perfect development and activity of all the powers that are in him. It is to be attained only by association with others. The good of the individual is merged in that of the State. Abstractly, then, ethics was, to him, a subdivision of politics. The separation of the two fields was largely on the practical side of Aristotle's treatment of the problem. The first book of "The Politics" describes the practical basis of the State. The State is an association of persons. It develops out of the family, household, and village. But the State is different from the household. In the household the master holds different relationships to the various members. In the State the ruler bears exactly the same relation to all citizens. This contention, however, required a justification of slavery. That justification Aristotle found in the fact that men differ from each other by nature. Only those of great ability are fitted to command, others must obey. The former are by nature masters, the

latter slaves. The combination of the two is necessary in the household. Therefore slavery is in accordance with nature. Aristotle severely criticized much of Plato's thought—especially his communistic scheme of the State. The working classes Aristotle deems essential to the State's existence, but this does not make them citizens. Their actual admission has been justified, he thinks, only by a regrettable lack of true material. However, Aristotle ever seeks the best attainable by actual men and under the given conditions.

True to the principle of the golden mean he holds that form of State best in which the middle class is stronger than either or both of the extremes. Circumstances, however, may make any form the best obtainable. Stability is the main essential to be secured.

From Aristotle's time to the period of Rome's power practically no contributions were made to political science. The Epicureans were interested in the ethics of the individual. Any form of State that produced quiet was sufficient for them. The Stoics, however, did concern themselves with the analysis of a law of nature above and beyond all human enactments—a principle which, says Lecky ("History of European Morals," vol. i., chap. ii.), "has been the basis of the best morality and of the most influential tho most chimerical political speculation of later ages."

Rome's genius was practical rather than philosophical. Her institutions rather than the theories of her great men exerted that profound influence on history for which she is justly famed. Polybius and Cicero were the chief writers. The first was responsible for the first formal exposition of the principle of check and balance in constitutional organization, the latter developed and outlined more fully than had previously been done the practical application of the concept, natural law.

II. The Medieval Period

The main political problem of the Middle Ages was the relation of Church and State. Rome had bequeathed to the successors of Charlemagne the traditions of a great State. The Church had built upon the simple teachings of Christ a great secular power. Thomas Aquinas (*q. v.*), in a treatise "Of the Government of Princes," left unfinished, but completed by his disciple, Ptolemy of Lucca, argued the independence of the Church. Dante (*q. v.*), in his "De Monarchia," defended the independence of the State. (For the discussion, see AQUINAS; CANON LAW; DANTE; MIDDLE AGES.) Both sides admit the need of a wise ruler. Only under such a ruler, said Dante, is freedom possible.

For citizens are not for the sake of the consuls, nor a nation for the king; but contrariwise the consuls are for the sake of the citizens, the king for the sake of the nation. For as a commonwealth is not subordinate to laws, but laws to the commonwealth, so men who live according to law are not for the service of the lawgiver, but he for theirs; which is the philosopher's opinion in that which he hath left us concerning the present matter. Hence it is plain also that tho a consul or king in regard of means be the lord of others, yet in regard of the end they are the servants of others; and most of all the monarch, who, without doubt, is to be deemed the servant of them all.

But this, tho the main, was not the only problem of the Middle Ages. Out of the unsettled condition of the times, out of the battle between the conflicting claims of emperor and pope,

of kings and barons, of empire and free city, rose the claims of the right of local government and the conception of limited monarchy.

III. The Modern Period

The modern study of political science is sometimes said to have begun with Machiavelli. He seems, rather, a link between the Middle Ages and the present, but to belong to neither. Concerning the vexed question of how to interpret his great work "The Prince," see MACHIAVELLI; but whether it be interpreted as satire or heartless opportunism, Machiavelli shows with masterly keenness how an unlimited monarch may take advantage of his subjects' characteristics to bend all to his will. He is modern in his study of facts; he is medieval in his worship of the State and kingly power. Buntschli considers his great service to have been that he divorced political science from theology.

In the sixteenth century political theory, like all other phases of intellectual activity, was dominated by the influence of the Reformation. Luther, Melancthon, Zwingli, and Calvin all held views on political subjects profoundly different from those of the unmoral and unreligious ideas of Machiavelli. The relation of State to Church regained its importance in discussion, and doctrines earlier set forth by Marsiglio, Ockam, Gerson, and Cusanus were developed in greater detail. The insistence of the reformers upon individual responsibility was still further emphasized by Knox, George Buchanan, Althusius, and Mariana. From this period on the state of nature, the contractual origin of society and government, and the indefeasible sovereignty of the people became the concepts which dominated the field until well into the nineteenth century. It was to Jean Bodin (*q. v.*), however, in his "Of the Commonwealth," that modern political science owes the statement of the necessary concept of sovereignty (*q. v.*), in the clear and unmistakable terms now current. To his mind the State could do no wrong. He it was also who reestablished political science where Aristotle had placed it, on a foundation of history and observation, and by the side of, not dependent from, the sciences of ethics and politics. After his death, however, his method of treating the subject suffered two centuries of eclipse through the prevalence of the *a priori* and deductive systems introduced by Grotius and Hobbes. It was in Montesquieu that Bodin found a worthy successor, and with him he shares the honor of marking out the lines within which the dominant philosophy of the later nineteenth century placed itself.

Not less famous than Bodin, however, is the name of Hugo Grotius, who, by his formulation of a scheme of rights and duties applicable to the relations of nation to nation, has come to be looked upon as the founder of international law (*q. v.*).

Among the early English works Fortescue's "On the Nature of the Law of Nature" and "On the Governance of England," as well as More's "Utopia," require mention. Hobbes (*q. v.*) with his "Leviathan" and Locke (*q. v.*) with his "Two Treatises of Government," were nevertheless the dominant factors in the formulation of political theory in England. (For a full discussion of the origin of and the difference between Hobbes's, Locke's, and Rousseau's forms of the theory of natural rights and the social contract, see

NATURAL RIGHTS.) With Hobbes all men are by nature free and equal; but since in this state without government they would constantly be at war, they have compacted together to give over their natural rights to some person or persons who have the sovereignty, and having given away their rights they no longer have them, and hence they can only absolutely obey. The sovereign is irresponsible and absolute. The people are his subjects.

With Locke, the people have made a similar compact, but have reserved the right to withdraw their allegiance when they will. Hence the right of revolution as defended in his "Essay on Civil Government."

Rousseau's social compact is one in which the people surrender their rights to all the people and not to the sovereign.

These theories exerted a profound influence over the modern world. The doctrine of natural rights played a prominent part in producing the French Revolution; it produced declarations of rights in various American colonies; it molded the Declaration of Independence and has affected the whole history of the U. S. even more than that of Europe. (For further discussion of these topics, see CONSTITUTIONALISM; NATURAL RIGHTS.)

In England first arose an effective check to these theories. Montesquieu's "The Spirit of the Laws" had, indeed, appeared fourteen years before Rousseau's "Social Contract," but Montesquieu, like Machiavelli, stands more or less isolated from political theory as its course is now traced. While he stood for history, observation, and broad generalization as the method of approach to political, economic, and social truth, as against the absolute standard of "nature" set up by most of the eighteenth-century writers, he nevertheless failed to exert great influence until the nineteenth century.

It was Hume who brilliantly disputed the validity of the social contract and Blackstone and Bentham who built up where Hume tore down.

Bentham's "Fragment on Government" appeared in 1776, but he belongs distinctly to the nineteenth century. He draws the following distinction between "natural" and "political"

society: "When a number of persons (whom we may style subjects)," he says, "are supposed to be in the habit of paying obedience to a person or an assemblage of persons, of a known and certain description (whom

we may call governor or governors), such persons altogether (subjects and governors) are said to be in a state of political society. When, however, a number of persons are supposed to be in the habit of conversing with each other, at the same time that they are not in any such habit as mentioned above, they are said to be in a state of natural society." Nevertheless, as Bentham goes on to show, the difference is one of degree only. Association passes by insensible gradations into definite and permanent relations. In political society laws are the commands of the supreme governor, the field of whose authority is indefinite. The subject's duty is to obey punctually, but his right is also to "censure freely." The basis of censure is to be utility—the greatest good of the greatest number. (See BENTHAM.)

Austin (*q. v.*) is a writer whose works have been much discust and much misunderstood.

Natural Rights

The Nineteenth Century

He writes abstractly and dogmatically, developing the clear concept of sovereignty with little reference to moral, social, or historical considerations. This lack, Pollock says, "has been supplied by Sir Henry Maine in the two last chapters of his 'Early History of Institutions,' and later by Mr. Frederic Harrison, in the *Fortnightly Review*. Still more lately Professor Holland has exhibited the results of the English school in a form wholly freed from the old controversial encumbrances, and thereby freed also from the extreme insularity which has prevented Austin's work entirely, and Bentham's to a great extent, from being appreciated by Continental thinkers."

The German school of political science is characteristically transcendental. It begins with Kant's "Rechtsstaat" and the German "Naturrecht"; it is developed in Fichte's socialistic treatment of his early individualistic conception of the State as composed of individuals, and Hegel's individualistic treatment of a socialistic conception of the State; it results in the paternalism of German State socialism, and the democratic socialism of Marx and Lassalle.

Germany

German political science, however, like German political economy, has developed a strong historical school. Even Hegel, in his theories, has much reference to history. Savigny, however, is the great German founder of the historical school. The problem, however, most discusst in political science in the present century has been the function and the extent of the function of the State. Wilhelm von Humboldt in 1791 argued that the sole duty of the State was the maintenance of the legal security of each individual; but most Germans have differed from this. Fichte notably broke through these narrow bounds. Friedrich J. Stahl considers the State "the union of the multitude to an ordered common existence, the setting up of a moral authority and power, exalted and majestic, to which the subjects must submit." Fr. Schmitt-henner declared the State to be "an ethical organism for the purpose of giving public expression to life, law, well-being and culture." Waitz ("Politik," 1862) says: "The State is not something arbitrarily made; it does not arise by a contract between men nor by the power of one or more individuals. The State grows like an organism, but not according to the laws, nor for the ends of mere natural life; it has its foundation in the higher moral tendencies of man, and is a sphere for the realization of moral ideas; it is not a natural but a moral organism."

More recent thought of this school has emphasized the element of nationality. Welcker in Freiburg, Lieber in New York, Laurent in Ghent, Mancini and Padelitti in Rome, Pierantoni in Naples, and notably Bluntschli in Zurich and Munich, have emphasized this thought.

The opposition to the historical and national school has been mainly in England. Mill criticized the paternal theory of the State from the radical standpoint, tho he later in life in many practical ways modified this and learned even to call himself a Socialist. (See MILL.) Buckle and Bagehot apply the methods of natural science and environment to the theory of the State; Baron Eötvös in Hungary, Laboulaye in France, Morley in England, follow Mill's liberalism. Herbert Spencer bitterly opposes any ex-

tension of the function of the State, in which he is opposed by Huxley (*q. v.*) and Ritchie (*q. v.*). Latest political science, however, devotes itself more to special subjects and historical research and analysis. Gneist in Germany, Stubbs, Anson, and Dicey in England, Macy in America, are among the chief students of the English Constitution. Laboulaye writes admiringly of the American Constitution. Treitschke, Lorenz von Stein, and others have studied Prussian and German administration. De Tocqueville (early in the century) and Bryce and Lecky (recently) have written general studies of American democracy. Paul Janet, in France, has written what some consider the best general history of political science.

POLITICAL SCIENCE IN AMERICA: It would be difficult to overestimate the influence which the rise of the great American Republic has had on the recent phases of political philosophy. Not that the United States has produced a striking literature of the subject. The American spirit is more at home in practise than in theory. It has been the facts of our political history, far more than the literary formulation of our political science, that have produced important results. To the philosophers of Europe, groping blindly about among the rubbish of antiquated systems for a foundation on which to build a strong modern theory of the State, the development of American political institutions was full of suggestions. The Americans themselves worked away at their nation-making quite untroubled, for the most part, by philosophical perplexities. In the crisis of attaining their independence the speculative minds among them followed unquestioningly the theories of natural rights and social contract, which were the staple of English and of Continental thought. There was nothing original in the ideas of Otis, Adams, Mason, or Jefferson; only in the application was novelty to be found. In the crisis of constitution-making, the same was true. Hamilton, Madison, and the other leaders in the movement of 1787-89, followed the theories of Locke and Montesquieu and Burke; but exhibited a marvelous sagacity in distinguishing the features of those theories that were of immediate applicability to the problems at hand, and in rejecting that which, however attractive in philosophy, was not of practical moment.

The reaction of American methods on Europe became manifest at the outbreak of the French Revolution. The formulation in written documents of the rights of subjects and the form and powers of governments followed American precedents; and the effect of this practise, in clarifying thought on political subjects, was enormous. In America itself speculation in reference to the written constitution took a narrow legal form. The meaning of the language in this one concrete document absorbed our interest, and we became a race of constitutional lawyers. But beyond the

England

seas the written constitution, as a new phenomenon in politics, excited debate as to its abstract significance, and as to its importance, not to a particular State, but to the State in general. A new turn was given to the perennial discussion as to the relative position of monarch and people in reference to ultimate political authority. European thinkers, with the concept of a written constitution to work upon, were able to assign to the popular will a much more definite function in the abstract state. Moreover, the progress of an untrammelled democracy on this side of the water attracted the attention of social philosophers. The study of our institutions has been the source of such profound reflections, on both the good and the bad aspects of democratic development, as are to be found in De Tocqueville, in Maine, and in Bryce.

The crisis of our struggle for national unity, culminating in the Civil War, produced a considerable volume of literature, in which a solution for our practical problems was sought in the principles of abstract political theory. Lieber's "Political Ethics," published before 1840, was the most complete treatise of a broad philosophical character prior to the war; and this work followed very closely the lines of German speculation of the day. Of our great ante-bellum statesmen, Calhoun was the most endowed with the spirit of speculation, and his "Disquisition on Government" embodies some very suggestive ideas on the ultimate principles of government, apart from his peculiar interpretation of the American Constitution. Of the works called forth by the exigencies of reconstruction at the end of the war, Hurd's "Theory of Our National Existence," Brownson's "American Republic," and Mulford's "The Nation" are notable. All of these betray a close dependence on prominent schools of European thought, but all are devoted to adapting the old formulas to the determination of a national sovereignty in the Constitution of the U. S. This question of sovereignty in relation to our written constitution, is a characteristic feature in the work of Jameson, "The Constitutional Convention," and in that of Burgess on "Political Science and Comparative Constitutional Law." The definitions and distinctions evolved in these latter works in the conception of sovereignty have denoted a clear advance in political theory, and have been correspondingly influential. A similar line of advance is to be seen in the works of Anson and Dicey on the English Constitution, and these writers, the latter in particular, reveal their indebtedness to American institutions for light in pushing their way. At the same time continental thought, especially since the problem of German national organization was solved, has looked for inspiration and example across the Atlantic. Laband and Jellinek, the leading German publicists, are finding solutions for the problems of constitutional law and politics in the same conceptions of sovereignty that have been developed by American conditions. It is not unfair to say that American facts and American theories, together, have given to individual rights their surest present guaranty through written constitutions, and to national authority its surest support through the interpretation of sovereignty in those constitutions. WM. A. DUNNING.

Since the Spanish-American War several new problems have arisen. The first of these was the

determination of the republic's colonial or imperial policy. That has been settled, apparently, on the basis that all continental territory of the U. S. shall be made, ultimately, states of the union and that all extracontinental territory shall either be made, ultimately, states of the union—as, possibly, the Hawaiian Islands and Porto Rico—or be erected into communities even more completely self-governing than states of the union, under the protectorate of the U. S. A second question of importance is whether interpretation of the Constitution can be made sufficiently elastic to meet the mighty changes that have been wrought recently in the structure of our political and civil society and in our commercial and industrial relations. No amendment has been made to the Constitution for some twoscore years. The methods of amendment provided in the instrument itself are unwieldy and possibly unworkable. Nevertheless, it is becoming more and more evident that by interpretation, amendment, or otherwise, the attainment of some reasonably rapid means of adopting the written instrument to new conditions is a problem of political science in this country that must soon be solved. The proper construction of the upper chamber of the legislature and the fixing of the fundamental relation between the legislature and executive branches of government are also present-day problems of American political science. Extension of the legislation of the federal government into the domain of private law—especially in the regulation of commerce and matrimonial relations—and the limitations to be placed on such extension is still another question of importance.

POMEROY, ELTWEED: President of National Direct Legislation League; born at Newark, N. J., 1860. Educated in public schools, graduating from Newark High School, 1878, he engaged in the manufacture of writing-ink, mucilage, paste, sealing-wax, etc., with the firm now known as Pomeroy Brothers Company, and of which he is now president; he has traveled extensively and has worked for various economic and political reforms. Mr. Pomeroy is a conservative Socialist of the American Fabian type, but refuses to connect himself with the Socialist Party; believes that nothing can be more democratic either in principle or practise than direct legislation of the initiative and referendum, and therefore has chosen that for his life-work. President of National League since its formation in 1896, he has also been secretary of the Direct Legislation League of New Jersey since 1892; edited the *Direct Legislation Record* for nine years; at one time associate editor of *The Arena*. Secretary of National Social and Political Conference, 1899; chairman of Conference in 1901; member of National Committee of the People's Party. He is author of "By the People"; has also written on socialism and many economic subjects in the magazines and public journals. Address: Milburn, N. J.

POORHOUSE (for statistics, see **PAUPERISM; POOR RELIEF**): A public institution for the care and support of the poor in general. In America such an institution is frequently called an almshouse, but in England this latter term is usually reserved for small single houses, generally supported by private charity, in which one or more poor persons may live. The institution

in England corresponding to the public poorhouse or almshouse in America is the workhouse, so called because all inmates who are able are compelled to work. The workhouse in England is maintained by the Poor Law Union (see POOR-LAWS), while the poorhouse in the United States is usually a county institution, tho in New England it is maintained by the town, and some cities have independent poorhouses of their own. The poorhouse in rural districts is frequently located on a large farm, and is often spoken of as the "poor farm" or "county farm." All of these terms have of late years been giving way, and rightly, to such terms as "county infirmary" and "county home."

Poorhouses were unknown in classical antiquity. With the advent of Christianity, however, houses for the care of the helpless poor began to be provided; and the Emperor Julian, imitating the Christians, issued an edict ordering the erection of poorhouses. During the Middle Ages the work of the poorhouse was chiefly

History

performed by the hospitals, which were in reality ecclesiastical almshouses for the reception not only of the destitute sick, but of destitute children, the aged, the infirm, and the helpless of every class. Toward the end of the Middle Ages, also, a great many private almshouses for the shelter of the poor were established by private bequests, many of which still exist in European countries.

The famous Poor Law of Elizabeth (1601) provided for the erection and maintenance of poorhouses by parishes, and especially commended that those unable to work should be relieved therein. But the parishes, being small administrative units, were slow to avail themselves of this permission, and comparatively few poorhouses were erected. In 1697 the city of Bristol erected the first workhouse, a poorhouse in which the inmates were compelled to work if able, the idea being in part to make them contribute to their own support, and in part also, at first, to teach them trades. The Bristol workhouse being successful, the example was followed by other cities, and in 1723 Parliament passed an act enabling two or more parishes to combine for the erection of a common workhouse. It was not, however, until 1834, with the passage of the Poor Law Amendment Act (see POOR-LAWS), requiring that every Poor Law Union have at least one workhouse, that the workhouse became universal in England.

The early settlers in America usually cared for their few helpless poor by boarding them out with farmers; and this primitive method is still followed in portions of the U. S. that are thinly populated. Later, when the number of helpless dependents had increased, in order to diminish their cost and perhaps provide more humane treatment, the town or county authorities purchased land and erected a public poorhouse, or even more frequently made use of some farmhouse purchased with the land for such an institution. The management of this institution and the care of the inmates were usually let out by contract to the lowest responsible bidder, a system which still prevails, as we shall presently show, in many parts of the U. S. At this stage of development the poorhouse was the public catch-all for all classes of dependents. Children, insane, feeble-minded, epileptics, cripples, blind, deaf-mutes, the sick, the aged, and the infirm of

all sorts were herded together with little care and often in dire misery.

About the middle of the nineteenth century special institutions began to be established in the U. S. for the care of some of these classes, especially for dependent children, the blind, the deaf, and the insane. This movement resulted in a part of these classes being removed from the poorhouses. At the same time better buildings began to be provided for poorhouse use, usually of the "institutional" or hotel type. Within recent times the movement to exclude special classes from the poorhouse has so far advanced that seven states now exclude the insane by statute, and eleven states dependent children; while all the states have made more or less provision for indigent defectives in special institutions. Some of the more recent poorhouses, also, built upon the "cottage plan," which will be described below, are models of humanitarian institutions; but in many other cases the poorhouse remains what its evil reputation has long made it—a place more dreaded than the common jail.

The poorhouse is, as Warner says, "the fundamental institution in American poor relief." It is fundamental because it receives those classes who are not otherwise provided for, and because, as we have seen, historically all the other public institutions which provide for the poor have been derived from it. Nevertheless, on account of the difference of the poor-laws in different states, and on account of the difference in local conditions, there is probably more diversity in the poorhouses of the U. S. than in any other public institution. Over half of the counties in the U. S. have no public poorhouse at all, but care for their paupers through outdoor relief or by boarding them out with farmers, as we noted above. Nearly one half of the states, moreover, provide in their statutes that the care of the poorhouse and its inmates may be let out by contract to the lowest responsible bidder; and in two states this is even compulsory.

In an investigation of the county almshouses of Missouri, made by the writer in 1903, it was found that, out of 90 of these institutions, 55 were managed by being let out to the lowest responsible bidder; 58 had insane among their inmates; and nearly all had more or less of the other classes of mental defectives. Moreover, out of 60 almshouses from which information could be obtained, only 12 had buildings costing above \$10,000, and supplied with modern conveniences; while in the case of 21 the cost of the buildings was less than \$1,500. Finally, 50 out of the 90 almshouses had no classification of inmates except the separation of the sexes, and 14 had not even that. These facts are given concerning the poorhouses of a single state because they are typical of average conditions, taking the country as a whole.

The causes of poorhouse abuses are not far to seek. It must be remembered that the poorhouse is usually a county institution and not under the direct control of the state; and that the county is usually a small administrative unit, relatively stingy and unenlightened in its public policies. The county authorities fear that a comfortable poorhouse will attract some of the shiftless elements among the poor and thus entail, with its cost, a double burden upon the taxpayers. Rather than be troubled with enforcing strict rules of administration to prevent the poorhouse from harboring these worthless elements, they

Evils

adopt the simple expedient of making the standard of comfort so low that only the most wretched will accept it. The result is

that the poor dread the poorhouse worse than a prison, and that the average poorhouse is a disgrace to civilization.

It is evident from what has been said that the proper function of the poorhouse cannot be to care for all classes of dependents. By its very nature the poorhouse is usually a small, local institution, and it cannot be expected that experts will have charge of it. It is, therefore, unfitted to care for dependents that need special or scientific care. Only those dependents that need simply a comfortable home are suitable for poorhouse care. These are, in particular, the aged and infirm poor, of whom in every old-settled community of any size there is always a considerable number. The first principle, then, in poorhouse administration is that all classes that need special care should be removed to special institutions. These classes include, in particular, the following:

1. All children above the age of two years. Children between the ages of two and sixteen should never be permitted to remain in an almshouse except for a brief period. The education of a child can be properly conducted in a poorhouse, and it has been found that children in poorhouses readily take on the taint of their pauper surroundings. What has been said applies, of course, equally to defective children, for they need special treatment in hospitals or schools.

2. Tramps, disorderly and vicious persons should be rigorously excluded from the public poorhouse. The poorhouse is not a correctional institution, and has no proper facilities for controlling such persons. Moreover, their presence brings the poorhouse into such ill repute that the self-respecting poor shun it.

3. The insane of all classes should be removed from the poorhouse. Probably the habitual use of our poorhouses as insane asylums gives rise to more serious abuses than any other practice. The insane need skilled medical treatment, trained attendants, cheerful surroundings, and a scientific diet, all of which are lacking in a poorhouse. Their presence is also a hardship to other inmates.

4. The feeble-minded of all grades should be removed from the poorhouse for similar reasons. They are not only objectionable to other inmates, and inadequately cared for, but a danger to the community. Under lax rules of admission and discharge feeble-minded women invariably become mothers, and entail their defect on future generations.

5. Epileptics, like the insane, need skilled medical care, and cannot be properly cared for in the poorhouse. Their presence is also disagreeable to other inmates.

6. Finally, hospital cases, whether surgical cases or contagious diseases, should of course not be cared for in the poorhouse.

After all of the above classes of dependents have, so to speak, been classified out of the poorhouse, there remains the equally important matter of classifying the inmates within the poorhouse. At least a fourfold classification of poorhouse inmates is necessary, even after all of the above classes have been removed. First of all, the sexes should be absolutely separated. Secondly, in the South, at least, there should be a classification according to color, making duplicate institutions, one for whites and one for colored.

3. A third necessary classification is in regard to health. There should be special provision for the sick, either in the form of separate wards or separate rooms. If there are cases of contagious diseases present, like consumption, they should of course be isolated. The fourth classification
4. needed is in regard to moral character. Inmates of similar standards and congenial disposition should be grouped together. Of course, if children, or any of the above classes to be excluded, are found in the poorhouse, still other classifications are necessary.

We may now consider briefly the form of construction of poorhouse best adapted to the above classification. Without doubt the "cottage" or detached plan of construction is best. This

makes classification of inmates easy and the institution more homelike in appearance, tho the cottages may be connected by corridors with the central building, in which there may be a common dining-room, kitchens, etc., and also one or two rooms for aged couples who wish to live together. A one-story construction has many advantages. Of course the buildings should be heated by steam, lighted by electricity, and furnished with the best modern sanitary apparatus.

All able-bodied inmates should be compelled to labor. Only thus can idle and shiftless elements be effectually excluded. Moreover, work should be furnished for all inmates who are willing and able to do any work at all. The best form of labor for men is, without doubt, agricultural labor. This does not, however, necessitate a large farm in connection with the poorhouse, as intensive culture, or horticulture, secures the best results. A large farm is objectionable for two reasons: first, it requires so much attention from the superintendent that he is liable to neglect the inmates; secondly, it necessitates locating the poorhouse far out in the country, where many modern conveniences cannot easily be furnished, and where the institution is liable to be neglected by the public.

Lax rules of admission and discharge are one of the evils of American poorhouses. Paupers should only be admitted, except provisionally, after an investigation by the proper authorities. Once admitted, they should not be permitted to discharge themselves, and should be released only when there is some assurance that they will be properly cared for outside of the institution.

Finally, in the management of a poorhouse, the attempt should be made to make it as homelike as possible. Recreations and amusements should not be neglected. Books and newspapers should abound, and simple entertainments, as well as regular religious services, should be provided for the inmates.

These reforms in the American poorhouse system cannot be carried out without some degree of central supervision and control. Probably the best central supervision can be furnished by an efficient State Board of Charities (*q. v.*). Local boards of visitors to poorhouses, which have now been provided for by law in several states, can also do much to correct abuses. However, the final reliance must be upon mandatory legislation. Statutes should be enacted regulating the construction and management of poorhouses in all necessary details.

CHARLES A. ELLWOOD.

POOR-LAWS (ENGLISH) (see also **PAUPERISM**; **POVERTY**): The poor-laws of England, which have played so large and important a part in her economic and social history, date mainly from the Elizabethan period.

In feudal times the poor were recognized as having direct claim on their lords; there needed to be no other legal provision. What more was needed was left to monastic and other ecclesiastical organizations, and to hospitals. There wa-

no inquiry into the causes of destitution; application for relief was the one thing needful. The inevitable consequence of this want of discrimination was that the very machinery for the relief of the poor became a means of increasing their number and deteriorating their character. The downfall of feudalism and the claim that the land belonged to those who had been only appointed to rule over it, the resultant stealing of the land by "the landed gentry" and the driving out of the feudal tenants, thus creating the modern landless class, developed a pauperism which differed widely from the poverty of preceding centuries.

Steps were first taken simply for the repression of the poor. An act of 12 Richard II., after providing for labor for persons able to work (see "Labor and Labor Laws," vol. xiv., p. 167), enacts "that beggars impotent to serve shall abide in the cities and towns where they may be dwelling at the time of the proclamation of this statute, and, if the people of the cities and towns will not, or may not, suffice to find them, that these, the said beggars, shall draw them to other towns within the hundred, rape, or wapentake, or to the towns where they were born, within forty days after the proclamation made, and they shall continually abide during their lives." This is the first enactment in which the impotent poor are directly named as a separate class.

But the problem grew. The reckless waste of national resources by Henry VIII., the dissolution and spoliation of the monasteries, the debasement of the currency, and the confiscation of the lands belonging to the craft-gilds—the continuous enclosure of common lands, and the enforced aggregation of men into the towns, all contributed to establish pauperism as a national institution.

In 1536 Parliament first attempted to cope with the problem by enacting that voluntary alms should be collected in each parish for the purpose of relieving the impotent poor.

Passing by various acts of similar import and growing more and more toward the compulsory relief of the poor, we come to the Elizabethan acts. Legislation (1572) took a vigorous turn "for the punishment of vagabonds and for relief of the poor and impotent."

The act of 14 Eliz., c. 5, reciting that "all the parts of this realm of England and Wales be presently with rogues, vagabonds, and sturdy beggars exceedingly pestered, by means whereof daily happeneth in the same realm horrible murders, thefts, and other great outrages, to the high displeasure of Almighty God, and to the great annoy of the common weal, and for avoiding confusion by reason of numbers of laws concerning the premises standing in force together," repealed before-mentioned statutes and made provision for various matters, "as well for the utter suppressing of the said outrageous enemies to the common weal as for the charitable relieving of the aged and impotent poor people." Persons above fourteen, and being rogues, vagabonds, or sturdy beggars, and "taken begging in every part of this realm, or taken vagrant, wandering and misordering themselves," were upon their apprehension to be committed to prison to the next session or jail delivery without bail, and on conviction "shall be adjudged to be grievously whipt, and burnt through the gristle of the right ear with a hot iron of the compass of an inch about, manifesting his or her roguish kind of life, and his or her punishment received for the same." This judgment was not to be executed if, after imprisonment, "some honest person, valued at the last subsidy next before that time to 5s in goods or 20s. in lands, or else some such honest householder as by the justices of the peace of the same county, or two of them, shall be allowed, will of his charity take such offender before the same justices into his service for one whole year," under recognizance to keep this poor person for that period and to bring him, if still living, before the justices at the year's end; on the other hand the pauper, departing within the year against the will of his master, was to be whipt and burnt as above provided. The offender was absolved from a second punishment for a short time, but if after threescore days, and being of the

age of eighteen or more, he "do oftsoons fall again to any kind of roguish or vagabond's trade of life," then the said rogue, vagabond, or sturdy beggar, from thenceforth was to "be taken, adjudged, and deemed in all respects as a felon," and should suffer as a felon—subject, however, to like redemption as on the first charge, conditioned for two years' service; but offending a third time he was to "be adjudged a felon," and suffer pains of death and loss of lands and goods as a felon, without allowance or benefit of clergy or sanctuary. Offenders under fourteen were punishable by whipping or stocking, as provided by the repealed statutes.

This was harsh, but the short-lived law of Edward VI. was harsher still. It allowed, however, for many exceptions, and called for charitable relief.

The numerous charities and endowments and foundations of almshouses, by will and otherwise, of the sixteenth and seventeenth centuries, still extant in numerous buildings throughout the country, are illustrations of the spirit of the legislation here referred to.

Still, legal repression and private charity did not work, and occasioned the legislation of 1601, laying the foundation of the poor-law system which has endured in substance even down to the present century.

By this act two or more "substantial householders" were to be yearly nominated by the justices of the peace to serve as overseers of the poor in each parish. The overseers were to raise "weekly or otherwise, by taxation of every inhabitant, such competent sums of money as they shall think fit, for (a) setting to work the children of all such whose parents shall not be thought able to keep and maintain them; (b) for setting to work all such persons, married and unmarried, having no means to maintain them, and who use no ordinary and daily trade of life to get their living by; (c) for providing a convenient stock of flax, hemp, wool, thread, iron, and other ware and stuff, to set the poor on work; (d) for the necessary relief of the lame, old, impotent, blind, and such other among them being poor and not able to work.

Poor-Law of 1601

Children whose parents cannot maintain them are to be apprenticed till the age of four-and-twenty years in the case of boys and twenty-one years or the time of marriage in the case of girls. The overseers may, with the leave of the Lord of the Manor, erect houses for the impotent poor on any waste or common.

No provision is made for the erection of any house in which work may be done, and it was evidently intended that the flax, hemp, etc., should be worked up at the houses of the poor. But an act of 1576 had already empowered the justices of each county to erect "houses of correction," in which "such as be already grown up in idleness and so rogues at this present" should be set to work under strict prison discipline; and the justices were now ordered to commit to these places, or to the common jail, those who refused to work on materials provided by the parish. What they had to expect at the houses of correction may be seen from one of the rules of the Suffolk House for the year 1589—"Item, it is ordered and agreed upon that every strong or sturdy rogue at his or her first entrance into the said house shall have twelve stripes upon his bare skin with the said whip provided for said house; and every young rogue or idle loiterer six stripes with the said whip in form aforesaid. And that every one of them, without fail, at their first coming into the said house, shall have put upon him, her, or them some clogs, chain, collars of iron, ringle, or manacle, such as the keeper of the said house shall think meet."

The new act was only gradually carried out. In 1622 "A Wellwisher" complains, in a tract called "Grievous Groans for the Poor," that "tho the number of the poor do daily increase, there hath been no collection for them, no not these seven years, in many parishes of this land, especially in country towns; but many of those parishes turneth forth their poor, yea and their lusty laborers that will not work, or for any misdemeanor want work, to beg, flich, and steal for their maintenance, so that the country is pitifully pestered with them; yea and the maimed soldiers that have ventured their lives and lost their limbs on our behalf are also thus required. . . . So they are turned forth to travel in idleness (the highway to hell) . . . until the law bring them unto the fearful end of hanging."

In 1630 a royal commission was appointed to examine into the working of the law, and new legislation resulted. In 1662 the statute 13 and 14 Charles II. recited various evils, and developed the law of settlement, which proved so fruitful in ills.

It said "by reason of some defects in the law, poor people are not restrained from going from one parish to another, and therefore do endeavor to settle themselves in those parishes where there is the best stock, the largest commons or wastes to build cottages, and the most woods for them to burn and destroy, and, when they have consumed it, then to another parish, and at last become rogues and vagabonds, to the great discouragement of parishes to provide stock, where it is liable to be devoured by strangers." Justices of the

Law of Settlement

peace, upon complaint by the parish officers, within forty days after any such persons' coming to settle as before mentioned in any tenement under the yearly value of £10, were empowered by warrant to remove such person to the parish where he was last legally settled either as a native, householder, sojourner, apprentice, or servant for not less than forty days, unless he gave sufficient security for the discharge of the parish.

This act at once divided England into 14,000 warring communities, each determined, at whatever cost, to throw its burden of involuntary charity upon its neighbor. A huge code of case law, developed by hundreds of judgments and appeals, was founded upon the muddled sentences of the original acts. Every possible subtlety as to the effect of every variety of hiring or apprenticeship, or the validity of indentures given by a parish where the churchwardens and overseers were the same persons, was defined to a hair's breadth, while the incurable vagrant, the too ambitious laborer, the widow, the lunatic, the invalid, the unhappy causes of this warfare, were carted and whipped and driven backward and forward from one cruel little parish to another.

The eighteenth century saw some changes in the law. It had evidently produced evil. It was not until toward the close of the eighteenth century that an important inroad on the law relating to the removal of the poor was made by requiring actual chargeability before removal to their place of settlement (35 George III., c. 101); and at the same time justices were empowered to suspend removal in the case of sickness.

There was some development of relief. In 1676 William III., when appointing his new Board of Trade, instructed them to "consider of proper methods of setting on work and employing the poor, and making them useful." Two years later a new "corporation" was formed for London, and several houses in Bishopsgate Street were bought. Into these houses were taken "the poor distrest children that lay up and down in the streets of the city," and others, for each of whom the churchwardens of the various city parishes paid a shilling a week. There were about 400 in all. At Bristol, Cary succeeded in getting a workhouse established. The example was followed by other places. The results, in suppressing vagrancy and keeping down the rates, were so good that in 1722 a general act was passed allowing parishes either singly or in combination to build workhouses, and to refuse relief to all who would not enter them.

In a book published in 1725, describing about a hundred of the newly established houses, a correspondent from Rumford writes: "I must, sir, observe to you that the advantage of the workhouse to the parish does not arise from what the people do toward their subsistence, but from the apprehension the poor have of it." The workhouses were run for profit. John Locke's report to the Board of Trade, written in 1697, contains exact calculations as to the value of the labors of young children, and of those who, being decayed of their full strength, could yet do something.

A few years, however, sufficed to develop the injurious effects of this mode of dealing with

the poor, and the accumulated evils of the working of the poor-laws led, in 1783, to the passing of the statute 22 George III., c. 83, known as "Gilbert's Act," the principle of which was extensively adopted in subsequent legislation. Only the aged and infirm were to be sent to workhouses, and the principle was deliberately adopted that work was to be found in the neighborhood for the able-bodied, and that any difference between their wages and the sum necessary for their maintenance was to be made up from the rates.

In 1795 the magistrates of Berkshire "and other discreet persons" announced that they would make an allowance in aid of wages to "all poor and industrious men and their families," raising the household income in each case to a minimum varying with the price of bread. And so began the pauperization of the English rural population. Hitherto relief, in theory, at least, had been confined to the exceptionally unfortunate. Now the rates were to become part of the normal industrial system; farmers discharged their men in a body, to take them back next day as paupers with part of their wages paid by the parish.

Says Thorold Rogers ("Work and Wages," chap. xv.):

I can conceive of nothing more cruel, I had almost said more insolent, than to condemn a laborer to the lowest possible wages on which life may be sustained, by an act of Parliament, interpreted and enforced by an ubiquitous body of magistrates, whose interest it was to screw the pittance down to the lowest conceivable margin, and to inform the stunted recipient that, when he had starved on that during the days of his strength, others must work to maintain him in sickness or old age.

The suffering and demoralization of the English laborer that resulted from the system can to-day be scarcely credited. He could not live except by pauper relief. He cared therefore little about work. It was really the parish that sold his labor. In some parishes the laborers were put up at auction. Sometimes children of either sex were sold to manufacturers in job lots (the manufacturer sometimes contracting to take one insane child for so many healthy ones). Often children of both sexes were given over to gang-masters, who would let them out to farmers, working them in the field by day and lodging them in barns by night without any pretense of decency. The poorhouses were called "bastiles." The degraded laborer came to look upon pauper relief without shame, and the distributor of the relief would go around and distribute the bread the laborer could not buy. The poor-relief rates rose till they threatened to devour the rents of the landlords. The landlords themselves were compelled to desire a change. Various minor changes led to the appointment of commissioners to investigate the subject and the great reform law of 1834.

Says Graham Wallas (see references at the end of this article):

Their report, after two years of incessant labor on the part of the commissioners and their paid assistants, was presented in 1834, and is still the most magnificent State paper in existence, admirable in form and crushing in argument. It ended by recommending a radical alteration of the whole system. Parishes were to be formed, with or without their consent, into unions, whose accounts were to be inspected and whose by-laws were to be drawn up by a body of three commissioners sitting in London, and represented by traveling subcommissioners in the country. Outdoor relief to able-bodied persons was to be prohibited. Finally, and chiefly, the whole administration of the law was to be regulated on the principle that "the condition of

the paupers shall in no case be so eligible as the condition of persons of the lowest class, subsisting on the fruits of their own industry."

The report was adopted by overwhelming majorities. Repression of the poor was now the order of the day. Outdoor relief was gradually ended. Families were broken up, lodged in poor-houses, husband and wife being separated. Says Mr. Wallas:

The sordid abominations of the old law were soon forgotten, and the religious workman as well as the revolutionary Chartist loathed the new science which aimed, it was said, at reducing the population to Parson Malthus's standard by starving the paupers and separating man and wife in direct defiance of the word of God. . . .

The opposition to the new law soon penetrated to the House of Commons, and it was with increasing difficulty that the powers of the commissioners were from time to time renewed. At last, in 1847, the Poor-law Commission was dissolved; two out of the three worthy gentlemen of the day disappeared, having perhaps taken themselves rather too seriously as solitary protesters against an evil world; and an official Poor-law Board with a parliamentary head was created. By 1871 so many duties of various kinds had been assigned to the department that it took the name of the Local Government Board, which it still retains. Sixty years have now passed since the new poor-law was first enacted. During that time the great evil noted by the commissioners of 1834, the relief of able-bodied men in aid of wages or as a premium upon idleness, has practically disappeared.

Relief is now given under a series of general orders and instructional circulars issued by the Local Government Board.

Outdoor relief is under strict limitations given in money and in kind, but in the case of able-bodied persons it is laid down that "one half at least shall be given in articles of food or fuel or in other articles of absolute necessity." Relief may also be given by way of loan. The relieving officer has to investigate the cases of all applicants; he can give temporary relief in kind, where necessary, and must report to the guardians as to the health, ability to work, etc., of the applicant and his family.

Of the working of the law, Mr. J. F. Oakeshot (see references) says:

The growth of humanitarian feeling has had its influence on poor-law administration, and the inhumanity of fifty years ago would not be tolerated by public opinion to-day. At the same time the administration of the law is still wanting in humanity. Over the entrance of Dante's hell was written, "Abandon hope, all ye who enter here," and if the effect of our poor-law system were to be summed up in a single sentence we should have to use the same words. In the desire of insuring that "the situation of the paupers shall not be made really or apparently so eligible as the situation of the independent laborer of the lowest class," we deliberately feed them worse than criminals (the prison dietary is luxurious in comparison with the poor-law standards), and we allow the law to be administered with such harshness that many men and women every year deliberately prefer death by starvation outside the workhouse to accepting relief from the rates with its deprivation of the privileges of citizenship and its dishonorable stigma of pauperism alike on aged and young, infirm and able-bodied, deserving and undeserving.

At present the poor-laws are universally regarded as a failure, at least in their present form, and a royal commission was appointed in 1905 to inquire—

1. Into the working of the laws relating to the relief of poor persons in the United Kingdom;

2. Into the various means which have been adopted outside of the poor-laws for meeting distress arising from want of employment, particularly during periods of severe industrial depression; and

To consider and report whether any, and, if so, what, modification of the poor-laws or changes in their administration, or fresh legislation for dealing with distress, are advisable.

Among the commissioners are Lord George Hamilton, M. P. (chairman); the Right Hon. Charles Booth, F.R.S.;

Mr. C. S. Loch, Prof. William Smart, the Rev. H. Russell Wakefield, Mrs. Bernard Bosanquet, Mrs. Sidney Webb, and Miss Octavia Hill.

Most people believe that the poor must be relieved in other ways. (See OLD-AGE PENSIONS; EMPLOYMENT BUREAUS; LABOR COLONIES; UNEMPLOYMENT, etc.)

Socialists assert that the only way to reform the poor-laws is to abolish them. Says the *Reformer's Year Book* (1907):

The only way in which to reform the poor-law is to abolish it. At present it is a separate department of government. It is subject to specially minute control by the Local Government Board, which issues ukases with the binding force of law. It is administered by specially elected boards of guardians. Its subjects are called paupers, and are deprived of the rights of citizenship whether they are veterans of labor or incorrigible rogues. This rubbish should be swept away. It is out of date, irrational, and unpopular. It pleases neither the well-to-do, who pay the piper, nor the paupers, who dance to the dismal tune. The pressing need is for a new classification. The aged, the sick, and the children, victims of accident or of a wrong system of wealth distribution, should be cared for, not under a special poor-law, but as part of the regular duty of the people's representatives. All legal disqualifications by poor relief must go. Old-age pensions will provide for some; grouped almshouses for others. The children must be educated, and fitted to take their part in the industrial life of the nation. The sick must be properly cared for. On the other hand, the idle, the wasters, the unemployable must be dealt with in farm colonies.

POPULATION (see also BIRTH-RATE; DEATH-RATE; MARRIAGE; CITIES; MALTHUSIANISM): We give in this article the principal facts as to population bearing on sociology, leaving to the various articles the discussion of the problems involved.

The figures of population shown on p. 922 will be found larger than those given in most year books, because they represent, in most cases, later returns.

If the whole earth were as thickly inhabited as Great Britain and Ireland (359.65 to the square mile, see next table) it would have, omitting desert and polar regions, a population of 18,218,430,000. Ravenstein estimates that the earth, with present methods of production, could support 207 to the square mile.

Dr. J. Bertillon, chief of the Statistical Department of the city of Paris, gives the following figures of the gain of population per 1,000 in ten years (*Bulletin de l'Institut International de Statistique*, vol. xiii., part ii.):

United States, 206; Mexico, 72.4; Austria, 92.6; Hungary, 102.5; Belgium, 122.9; Bulgaria, 182.1; Denmark, 126.7; France, 12.1; Germany, 139.8; Italy, 70.5; Netherlands, 131.3; Norway, 112.4; Russia in Europe, 136.2; Serbia, 172.6; Spain, 32.1; Switzerland, 101.7. (See BIRTH-RATE.)

POPULATION BY RELIGIONS

The tables on pp. 922 and 923 for countries in which a religious census exists, are based on such information as the *Statesman's Year Book* affords. For countries in which no such census exists they are taken from the *Blue Book of Missions* for 1905, from the latest official estimates, or careful returns from mission fields. For the United States, France, and in a few other instances they are from special sources as indicated in the notes. It is believed, therefore, that those figures represent

COUNTRIES, AREAS, POPULATIONS

The statistics in round numbers are estimated from official sources; exact figures indicate a census.

| COUNTRIES | Area in sq. m. | Population | Per sq. m. | Year | COUNTRIES | Area in sq. m. | Population | Per sq. m. | Year |
|--|-------------------|---------------------|---------------|------|---|-------------------|--------------------|---------------|---------|

¹ Estimated.² Nearly all these figures are based on estimates, and still they are given to the last decimal; the reason is that the number of Europeans is given in exact figures, that of natives estimated.³ Including West Indies, but not Labrador; the latter has about 120,000 sq. m. and an estimated population of 4,000.⁴ Average of estimates for several years, 1900 to 1903 and 1904.⁵ Curacao.⁶ Including Hawaii and Alaska.⁷ British Honduras, British Guiana, and Falkland Islands.⁸ Surinam; population does not include forest-negroes.⁹ Guiana.¹⁰ Estimated.¹¹ Inclusive of Formosa, Pescadores, and southern Sakhalin; but exclusive of Port Arthur and Liao Tung.¹² Bosnia and Herzegovina have been under the joint administration of Austria-Hungary since July 13, 1878, and pay no tribute to Turkey.¹³ For colonies, see respective continents.¹⁴ Crete has been autonomous since 1898 under guaranty of England, Russia, France, and Italy. But Greece has the right to nominate the High Commissioner and exercises a general supervision.¹⁵ Estimated.¹⁶ Including Azores and Madeira (both area and population).¹⁷ Russia proper, Poland, Finland, and Ciscaucasia.¹⁸ Including Samos, but excluding Crete (under Greece), Cyprus (Great Britain, Asiatic Colonies), Bulgaria, and Herzegovina.¹⁹ Malta and Gibraltar.²⁰ Payna, Fiji, Tonga, Solomon, and Gilbert Islands.²¹ Estimated.

THE WORLD
AREA, POPULATION, DENSITY, BASED ON LATEST OFFICIAL CENSUSES

| DIVISIONS ¹ | Area in square miles ² | Desert ³ | Population, latest censuses | Estimate of Supan ⁴ | Per square mile ⁵ |
|-----------------------------|-----------------------------------|---------------------|-----------------------------|--------------------------------|------------------------------|
| Africa..... | 20,612,000 | 2,226,000 | 156,174,000 | 140,700,000 | 14.71 |
| America, North ² | 28,527,000 | 95,000 | 214,460,000 | 205,714,000 | 13.42 |
| America, South..... | 7,703,000 | 45,000 | 40,403,000 | 38,482,000 | 5.19 |
| Asia ² | 14,876,000 | 1,200,000 | 879,455,000 | 819,556,000 | 59.05 |
| Europe..... | 3,809,000 | | 424,106,000 | 392,264,000 | 111.32 |
| Oceania ² | 4,141,000 | 614,000 | 49,779,000 | 6,483,000 | 12.02 |
| Polar regions..... | | | | 91,000 | |
| Total..... | 49,668,000 | 4,180,000 | 1,664,017,000 | 1,503,290,000 | 33.50 |

¹ For details, see table on p. 921. ² Including West Indies. ³ Including Japan, but not the Dutch East Indies. ⁴ Including all islands in the Eastern Indian and Southern Pacific Oceans. ⁵ Total inhabited area, but in part including desert, steppes, etc. ⁶ The columns "area" and "desert" in part overlap. Differences in estimates of authorities are in part accounted for by including or not polar regions, islands, water spaces, etc. ⁷ Estimate of Ernest G. Ravenstein, F.R.G.S., in "Proceedings of Royal Geographical Society," 1891, p. 27. ⁸ Ravenstein estimates the fertile regions of the earth at 28,269,200 sq. m.; steppes, 13,901,000; desert, 4,180,000; polar regions, 4,888,800. ⁹ Including 36,000,000 in the Dutch East Indies. ¹⁰ Obtained by dividing populations in third column by areas in first. ¹¹ Dr. A. Supan, in Dr. Peterman's "Mittellungen." ¹² *Ergänzungsheft*; No. 146. Gotha, 1904.

the latest returns and most reliable estimates yet made. As, however, for large spaces of the earth only the roughest estimates exist, there is room for wide divergence in such estimates. Figures

in round numbers indicate the estimates; exact figures, as in Europe, indicate a census. It must be remembered, too, that these figures are for adherents and not communicants:

RELIGIONS OF THE WORLD

| CONTINENTS | Protestants | Roman Catholics | Eastern churches ¹ | Jews | Mohammedans | Various |

¹ Almanac de Gotha, 1904.² Fournier de Flaix, 1892.

Dr. Fournier de Flaix, in the *Quarterly* of the American Statistical Association for March, 1902, gives the following estimates of the Eastern churches: Abyssinian, 3,000,000; Coptic, 120,000; Armenian, 1,690,000; Nestorian, 80,000; Jacobite, 70,000; which, according to the above, would leave 110,899,000 for the Greek or Orthodox Church. This estimate is, perhaps, the most reliable that can be made.

The *Blue Book of Missions* gives the following figures:

| | |
|-------------------------------|-------------|
| Buddhists..... | 137,935,000 |
| Hindus..... | 209,659,000 |
| Confucianists or Taoists..... | 291,816,000 |
| Shintoists..... | 24,900,000 |
| Animists..... | 157,697,500 |
| Unclassed..... | 15,352,000 |

SEX, RACE, AND NATIVITY

¹ School age, five to twenty, inclusive.² Twenty-one years and over.³ Including all persons in the military and naval service of the United States.⁴ Including all persons of negro descent.

The whole number of persons of school age—that is, from five to twenty years of age, inclusive—in 1900 is 26,110,788, of whom 21,573,492 are from five to seventeen years of age and 4,537,296 from eighteen to twenty years of age. These figures include, however, 217,523 persons of school age reported in Alaska, Hawaii, Indian Territory, and on Indian reservations. Eliminating the latter from the account there are: native born, 24,689,118; foreign-born, 1,304,147; native white (native parents), 14,775,476; native white (foreign parents), 6,371,221; foreign white, 1,193,443; colored, 3,553,125; persons of negro descent, 3,485,188; males, 12,972,994; females, 12,920,271.

The number of males of voting age is 21,329,819, of which there are: native-born, 16,227,285; foreign-born, 5,102,534; native white (native parents), 10,636,898; native white (foreign parents), 3,466,721; foreign white, 4,932,524; colored, 2,293,676; persons of negro descent, 2,065,589.

The ratio of population to males of voting age in the entire country is 3.6. This ratio varies, however, for the several elements of the population, the ratio of negro population to negro males of voting age being 4.3.

Area.—According to the census of 1900, the largest county in the U. S. is Custer County, Mont., which has 20,490 sq. m. The smallest is Bristol County, R. I., which has 25 sq. m.

GREAT BRITAIN

TOTAL POPULATION OF EACH DIVISION OF THE UNITED KINGDOM AT EACH CENSUS, FROM 1801 TO 1901

| CENSUS YEARS | Total for United Kingdom | England and Wales | Scotland | Ireland |
|--------------|--------------------------|-------------------|-----------|-----------|
| 1801..... | | 8,892,536 | 1,608,420 | (1) |
| 1811..... | | 10,164,256 | 1,805,864 | (1) |
| 1821..... | 20,893,584 | 12,000,236 | 2,091,521 | 6,801,827 |
| 1831..... | 24,028,584 | 13,896,797 | 2,634,386 | 7,767,401 |
| 1841..... | 26,709,456 | 15,914,148 | 3,230,184 | 8,175,124 |
| 1851..... | 27,368,736 | 17,927,609 | 3,888,742 | 6,552,385 |
| 1861..... | 28,927,785 | 20,066,224 | 3,062,294 | 5,798,967 |
| 1871..... | 31,484,661 | 22,712,266 | 3,360,018 | 5,412,377 |
| 1881..... | 34,884,848 | 25,974,439 | 3,735,573 | 5,174,836 |
| 1891..... | 37,732,922 | 29,002,525 | 4,025,647 | 4,704,750 |
| 1901..... | 41,458,721 | 32,527,843 | 4,472,103 | 4,458,775 |

¹ The census of Ireland in 1821 is the first which was made on such a basis as to afford a comparison with those of subsequent decades.

The population was thus distributed at the census taken April 1, 1901:

| DIVISIONS | Area in sq. m. | Density per sq. m. | Males | Females |
|--|----------------|--------------------|------------|------------|
| England and Wales.... | 58,309 | 405.6 | 15,728,613 | 16,799,230 |
| Scotland..... | 29,785 | 150. | 2,173,755 | 2,298,348 |
| Ireland..... | 32,583 | 137. | 2,200,040 | 2,258,735 |
| Isle of Man..... | 827 | 248.9 | 25,496 | 29,256 |
| Channel Islands..... | 75 | | 45,080 | 50,538 |
| Army, navy, and merchant seamen abroad | | | 367,736 | |
| Total..... | 120,979 | 359.65 | 20,540,720 | 21,436,107 |

According to the *Statesman's Year Book*, the proportion per cent of the population living in the various divisions of the United Kingdom was as follows, from 1851 to 1901:

| DIVISIONS | 1851 | 1861 | 1871 | 1881 | 1891 | 1901 |
|------------------|------|------|------|------|------|-------|
| England..... | 61.0 | 64.6 | 67.5 | 69.8 | 72.2 | 74.1 |
| Wales..... | 3.6 | 3.8 | 3.8 | 3.8 | 3.8 | 4.1 |
| Scotland..... | 10.4 | 10.4 | 10.6 | 10.6 | 10.7 | 10.8 |
| Ireland..... | 23.7 | 19.8 | 17.0 | 14.6 | 12.5 | 10.7 |
| Isle of Man..... | .2 | .2 | .2 | .2 | .1 | .1 |
| Channel Islands | .3 | .3 | .3 | .3 | .2 | .2 |
| Seamen abroad. | .8 | .9 | .6 | .7 | .5 | |

For other countries, see each country.

PORT SUNLIGHT ESTATE: A village built by Lever Bros., near Birkenhead, England (1888); is considered by many one of the most attractive industrial villages in the world. (See MODEL VILLAGES.) It has about 3,000 inhabitants in 600 houses, on 140 acres, tastefully laid out, with park and gardens. Houses here can be had for 5s. per week. They are of antique, half-timbered design, and fitted with bath and other conveniences. There are in the village a church, two fine groups of schools of various kinds, a commodious public hall, inn, restaurant, gymnasium, elegant public bath, fountain, cooperative stores, free library, and tennis, bowling, and quoit grounds. There are dining halls for men and girls, the latter seating 1,500 girls. Food is sold at very low prices, the covering cost. The principle on which the village has been developed has been what Mr. W. H. Lever, the founder, calls "prosperity-sharing" rather than profit-sharing. By this he means that, instead of giving their employees a small share in their profits paid as money, which the workman often squanders or misuses, the firm regularly sets by each year a proportion of its profits to be invested for the good of all, and mainly in land, houses, and institutions. Rents are based on paying only for repairs and 1 per cent to create a sinking-fund. The total cost up to 1904 has been over £35,000. The actual cost to the firm in interest is some £10,000 a year, but they consider that it is well repaid in the improved quality of workers secured. The system seems to be a success, since it has grown to 140 acres besides the soap-works, from a beginning with fifty-six acres. The village has some four miles of roadway from forty to seventy feet wide and all tree-lined with borders of tufted garden. There is a park of twenty-five acres. Allotments of land can also be hired with the houses. Much freedom is given the tenants; they are given the right, e. g., to vote on the license question for the inn, and vote "yes," the women so voting, in order that the men would not go to the neighboring "pubs." The number of persons allowed in the cottages is limited to prevent overcrowding, and the cottages are limited to ten per acre, being built for the most part not singly but in groups. The average cost of house and land is £354. This would ordinarily mean a rent of at least 12s. per week, whereas the tenants only pay about half that.

PORTO RICO: A dependency of the United States, having been ceded by Spain, 1898. It is administered by a governor and an executive council of six officials and five natives appointed by the President of the U. S. There is also a legislative assembly of thirty-five members elected by popular vote limited by small property qualification and a low educational test.

Area, 3,435 sq. m. Population (1899), 953,261, estimated at 1,000,000 in 1905. (Whites, 589,426; mulattoes, 304,352; negroes, 59,390.) San Juan has 32,048; Ponce, 27,952. The whites are mainly of Spanish descent, tho with the infusion of much Carib or Indian and even negro blood. The percentage of whites is higher than in most of the West Indies.

Exports to the U. S. (1905-6), \$19,055,474, of which sugar was \$14,184,319; tobacco, \$3,557,477. Imports from the U. S., \$18,648,991, of which cottons were \$1,670,005. Exports to other countries, \$4,060,594. Imports, \$2,602,784. The trade was mainly with France. July 25, 1901, free trade with the U. S. was established.

The chief product of the island is coffee, to which 170,000 acres are devoted. To sugar, 62,000 acres are given; to tobacco, 14,000. Bananas, pineapples, and oranges are

grown. Salt-works are somewhat developed. Many minerals exist, but are scarcely worked at all. Porto Rico had (1906) 200 miles of railway, and 517 miles of telegraph in 1905, with 930 miles of wire.

Those having gainful occupations in 1899 were 33.1 per cent, or 316,365. This small percentage is mainly due to the large number of children under ten, tho 1,670 of these were at work, mainly in agriculture. Of the white females, 7.4 were engaged in gainful occupations, and of colored females, 13.7. Of the males in gainful occupations, 73 per cent were engaged in agriculture, fisheries, or mining; 10 per cent in domestic and personal service; 8 in trade and transportation; 7 in manufacturing and mechanical pursuits. Seventy-six per cent of the total area is in farms, tho 52 per cent of these are only little patches of ground near a house. The prevailing rate of wages in the coffee district is thirty cents per day, measured by the price of provisions, a lower wage than before 1899. In tobacco the wage is forty cents, and in sugar fifty cents. Urban wages are considerably higher.

One cause of the low wages is the high birth-rate, partly due to low social conditions. The marital conditions are loose and transitory. For every 100 persons married there are at least fifty-three in loose unions. This condition is particularly present among the colored. Peonage is very common. A large part of the land is under absentee ownership, still largely Spanish. In the towns overcrowding in unfit buildings is a great evil, and rents are very high. Labor, tho nominally cheap, is so inefficient as really to be expensive. Sanitary conditions are very bad.

Education has been very low. In 1860 only 9 per cent of the whole population were literate; in 1899 it was 22.7 of those over ten years. Out of every 1,000 males over ten years of age 257 could read, and of every 1,000 women only 199. A large advance has been made. June 30, 1904, there were 1,113 common schools and 51 special. There were 139 American teachers (47 men), and 1,126 native. There were enrolled as pupils 47,089 whites and 16,467 colored. Of the total number, 26,162 were girls. The government set aside about \$2,000,000 as an especial fund for education, and \$700,000 a year is now spent, tho more is needed.

Sanitary reform was the first needed. Anemia, owing to bad conditions, caused some 30 per cent of the deaths. In 1899 76 per cent of the dwellings had no water-closet or privy of any kind. Dwellings and water sources were polluted. The government is rapidly changing this. Education, too, will increase efficiency, and better morals will do more. Trade-unions are in their beginning. The foregoing facts are mainly from a report by Dr. W. E. Weyl in the *U. S. Bulletin of Labor* for Nov., 1905. H. S. Bird, in the *Outlook* for Nov. 11, 1905, claims that Porto Rico now has less local autonomy than under Spain, and that therefore great dissatisfaction exists.

POST, LOUIS FREELAND: Editor of *The Public*, Chicago; born near Danville, N. J., in 1849; compositor 1864-66; a law student 1867-70 in New York City; in 1871-72 law clerk in South Carolina, where, in conjunction with Ben Pitman, he reported the famous Kuklux trials. After this returned to the practise of law in New York City. He was for a time assistant United States attorney. In 1883 was Greenback candidate for attorney-general. He was successively editor of

Truth, The Leader, Henry George's *Standard*, and took a prominent part in the Henry George campaign; temporary chairman of the Syracuse Convention of the United Labor Party; in 1887 he was candidate of that party for district attorney 1893-95 lectured in the U. S. and Canada; editor of the *Cleveland Recorder* 1896-97; in 1898 he founded the paper he now edits. Member of the Chicago Board of Education 1906-7. He adopts the single-tax theory. In political economy a classicist, he considers Adam Smith to be the founder and Henry George the logical perfecter of the classical system. He is author of "The Single Tax," "Ethics of Democracy," and "Ethical Principles of Marriage and Divorce." Address: First National Bank Building, Chicago.

POSTAL PROGRESS LEAGUE, THE: Organized in Boston, Mass., 1902. Its aim is a world post-office, covering the world's business of public transportation and communication, and supported by a cost of the service system of rates, regardless of distance, regardless of the character of the matter transported, regardless of the volume of business, rates determined by the representatives of the rate-payers in a world congress.

It advocates as the immediate work of Congress a common one cent a pound on all mail matter, postal savings-banks, a postal currency, the postal insurance of all mail matter, the use of traveling auto post-offices, collecting and delivering mail matter from door to door in our cities, a rural service doing the whole transport business of the rural routes, etc. The league publishes a little paper, *Postal Progress*. Secretary, Jas. L. Cowles, 361 Broadway, New York.

POSTAL SERVICE. (See also POSTAL SAVINGS-BANKS; TELEGRAPHS; TELEPHONE.)

The earliest postal service of the world was that of the trained runners or couriers who carried official and military messages between the cities of Greece and Rome.

At first they carried simply official messages. Gradually they came to carry private messages. All letters of the fifteenth and perhaps the fourteenth century in England evidently were carried by a system of messengers. The University of Paris organized a system of messengers in the thirteenth century. Sir Brian Tuke, in 1533,

is described as Master of the Messengers. In 1635 Thomas Witherings was authorized to run a post night and day between London and Edinburgh, "to go thither and back again in six days." Eight lines of post were established. The postage was 2d. for less than eighty miles, 8d. to any place in Scotland. In 1685 a penny post was established in London and suburbs. It was a private speculation, but, on succeeding, was annexed to the crown. In 1783 mail-coaches were substituted for boys on horseback. In 1837 Rowland Hill in England published a pamphlet, analyzing the postal system and showing £282,308 as the probable outgoings for receipt and delivery and £144,309 as the probable outgoings for transit. In other words, the expenditure which hinged upon the distance the letters had to be conveyed was £144,000, and that which had nothing to do with distance was £282,000. Applying to these figures the estimated number of letters and newspapers (126,000,000) passing through the office, there resulted a probable average cost of $\frac{1}{16}$ of a penny for each, of which $\frac{1}{16}$ was cost of transit and $\frac{1}{16}$ cost of receipt, delivery, etc. Taking into account, however, the much greater weight of newspaper and franked letters as compared with chargeable letters, the apparent average cost of transit became, by this estimate, but about $\frac{1}{16}$, or less than $\frac{1}{16}$ of a penny.

From this Hill argued that as it would take a ninefold weight to make the expense of transit amount to one farthing, he further inferred that, taxation apart, the charge ought to be precisely the same for every packet of moderate weight, without reference to the number of its enclosures.

Parliament was induced to appoint a committee, which sustained Mr. Hill. A bill was passed and Rowland Hill placed in charge. A penny was adopted as

Cheap
Postage

(Compiled mainly from the "Statistique Générale du Service Postal," published by the International Bureau of the Universal Postal Union, Bern, Switzerland, 1906. The numerous notes found in that summary have been omitted.)

1 Including some minor countries not here tabulated.

the uniform rate for every inland letter not above half an ounce. Facilities for prepayment were afforded by the introduction of postage-stamps, and double postage was levied on letters not prepaid.

As far back as 1793 a money-order office had been established as a medium for sailors and soldiers to transmit their savings, and its benefit had afterward been extended to the general public; but the commission charged had been so high that it was only employed to a very limited extent. The immediate result of the changes introduced in 1840 was an enormous increase in the amount of correspondence, arising in part from the cessation of the illicit traffic in letters, which had so largely prevailed before; but for some years there was a deficit in the post-office revenue.

With the development of the railway system came the carriage of letters by train, adding to the expenses of the post-office, but gradually the gross revenue of the post-office increased, and the net revenue after 1863. Many reforms were introduced: (1) The establishment of postal savings-banks (1861); (2) the transfer to the State of the telegraphic service (1870); (3) the introduction of postal cards (1870); and (4) the establishment (1883) of a parcel post.

The French postal system was founded by Louis XI. (1464). In 1627 France originated a postal money-transmission system. Mazarin's edict of Dec. 3, 1643, shows that France at that date had a parcel post as well as a letter post.

The German postal system also began early. In Strasbourg a messenger code existed as early as 1443. A postal service was organized at Nuremberg in 1570.

The Prussian system began with the establishment, in 1646, of a government post from Cleves to Memel. By the treaty of postal union with Austria (1849) the germ was virtually set of the International Postal Union.

The first postal service established in any portion of what is now the United States was probably made by the General Court of Massachusetts in 1639.

In 1672 the government of the Colony of New York established a "post to goe monthly from New York to Boston"; and notice was given to "those that bee disposed to send letters, to bring them to the secretary's office, where in a lockt box they shall bee preserved till the messenger calls for them, all persons paying the post before the bagg bee sealed up."

In 1692 the English Government put the colonial postal service in charge of a deputy postmaster-general, and in 1710 the first organized system for the transmission of the mails in the colonies was created.

In 1753 Benjamin Franklin, who had been postmaster at Philadelphia, was made Postmaster-General. A penny post was established at Philadelphia; in 1756 the first stage, probably, in the colonies began to carry the mails between Philadelphia and New York. In 1758 newspapers, which previously had been carried in the mails free, were charged with postage. Other reforms and improvements were begun, so that in

The United States
1774, the last of Franklin's administration under the crown, the net revenue of the postal service was over £3,000. In 1775 he was appointed, by the Second Continental Congress, "Postmaster-General of the United Colonies."

In 1792 an act was passed to establish a general post-office.

So insignificant was this department that in 1790 Samuel Osgood, in a letter to Alexander Hamilton, gravely discuss the question whether the Postmaster-General should not be required to occupy the room at the seat of government where the mails were received and dispatched, in order that he might personally superintend the work.

But the service rapidly grew. In 1834 railroads were first used. In 1851 letters not over one half ounce, prepaid, could be sent 3,000 miles for three cents. In 1855 the registry system was authorized; in 1863 the free-delivery system; in 1864 the money-order system; in 1885 the special delivery. Other reforms have been the introduction of railway post-offices, street postal cars; the system of delivery, postal cards and return cards, etc., etc.

In 1874 a Universal Postal Union was formed, mainly owing to the efforts of Dr. von Stephan, of Germany, tho it had been proposed to the various countries by the U. S. in 1862.

POSTAL REFORMS

It will be noted that in the foregoing the U. S., Mexico, and Argentina are the only countries

in the world, of which information is published, which have a deficiency in their postal departments. Every European country makes a profit from its post-offices.

In 1906 the postal revenue of Great Britain was £17,064,023, and the expenditures £11,795,109, leaving a net profit of £5,268,914, counterbalanced by a deficit of £754,707, in the telegraphic service, giving a total net profit of some \$22,000,000. Germany had in 1905 a net profit of some \$15,000,000; Russia, \$15,000,000, and France, \$14,000,000. For the

U. S. deficit of \$10,542,941 (1906) there are three main reasons:

Revenues and United States Deficit
1. The chief reason is undoubtedly the extent to which the U. S. railroads are allowed to overcharge the government for carrying mail matter. According to the analysis of postal expenditures of different countries by the International Bureau, Russia pays for postal transportation (by land and sea) only one sixteenth of her postal expenditures; Germany pays for transportation less than one tenth; Great Britain and France pay less than one ninth, but the U. S. pays out over one third of her expenditures for transportation. Says Prof. Frank Parsons:

While railways in other countries carry the mails for nothing or at cost, our government has to pay much higher rates than private shippers. For hauling mails the railways receive from the government from two to four times as much as they get from the express companies for equal haulage.

According to the estimate of Prof. Henry C. Adams of Michigan University, the statistician of the U. S. Interstate Commerce Commission, the average payment to the railways for carrying the mails is twelve cents and a half per ton-mile ("Report of Congressional Commission on Railway Mail Pay," 1900, part II, p. 253). Professor Adams is a high authority and his calculation was carefully made, route by route; but there is reason to believe that his result is too low; not because of error on his part, but because of incorrect data as to the weight of mails on which his estimate was based. The railroads were on trial at the time and many millions were at stake; and, at the special weighing in 1899, during the investigation leading to the twelve-cents-and-a-half estimate, the figures for the annual mail weight were multiplied by three almost, and the annual increase rose at a bound to eighteen times its previous size. The estimates of the Post-Office Department from 1890 down, indicate for the railway mail pay an actual rate of twenty-six to thirty-six cents per ton-mile instead of twelve cents and a half. But even if we take the Adams estimate, the resulting comparisons are sufficiently astonishing.

The express companies carry magazines and newspapers 500 miles and more at a cent a pound and the railways get less than a half a cent a pound, or two cents a ton-mile. That is not all. Any general express agent will tell you that the company will shade the rate for a large shipper. For example, the *Cosmopolitan* is carried from New York to Boston, 219 miles, for eighteen cents a hundred, or less than a fifth of a cent a pound. This is at the rate of 1.6 cents per ton-mile for the express company and three quarters of a cent a ton-mile for the railways; a rate about one sixteenth of the average mail rate and one ninth of the lowest mail rate on the lines where the volume of mail is greatest. The railways charge the government about three cents a pound for hauling second-class matter, according to Professor Adams, and eight cents according to Postmaster-General Wilson, but haul the same stuff for the express companies for less than a tenth of a cent a pound. And if the railways had any serious objection to such rates they would hardly have permitted them to continue all these years, but would have provided against them in their contracts with the express companies.

A further count in the indictment against the railways in respect to the mails is that there is good reason to believe they do not really carry the weight of mail for which they are paid. The weighing of the mails occurs only once in four years. The roads have notice beforehand and are strongly tempted to inflate the estimate. To accomplish this they "pad" the mails during the weighing time by sending back and forth large masses of books and papers, getting their friends in Congress to frank large quantities of printed matter, etc., and it does not seem to do much good to expose the fraud and secure a new weighing, for the railways find some new way to obtain the result. For instance, where a flagrant case of "padding" was discovered and exposed and a reweighing ordered, the padding was accomplished a second time by having many thousands of newspapers mailed during the

weighing period, to addresses furnished and paid for by the railroad company.

In addition to the regular mail rates the government pays an extra charge for postal cars averaging \$6,250 a year per car, altho the cost of construction of cars is but \$2,500 to \$5,000 each. For two thirty-foot apartments in two combination cars, each carrying one ton of mail, the railways get no car rental; nothing but the mail weight rates; but for a sixty-foot postal car with an average load of two tons of mail, heated and lighted like the compartments, and with the same fixtures as the aforesaid compartments plus a water-tank, the roads receive \$6,250 a year special car rent in addition to full rates for the weight of mail carried. This means \$5,368,000 a year for the rental of cars worth about \$4,000,000.

Robbery of the Government by the Railroads

A return in a single year of more than the whole capital invested is a pretty good rate of profit.

2. Another reason for the deficit in the U. S. postal service is the comparatively cheap carriage of second-class matter. This is the reason usually given in the reports of our Postmaster-Generals, who are afraid to give the main reason—the robbery of the government by the railroads, and it is, therefore, the reason ordinarily held out before the people. Congress, in 1905, at the recommendation of the Post-Office Department, appointed a commission upon the matter, and reforms have been introduced and efforts are being made to amend the laws, so as to rule out much more advertising matter, now improperly carried at newspaper rates. But the question is really of minor importance (or would be if the railways did not overcharge for carrying such mail). Witness the comparative prices for carrying mail in the U. S. and in Europe. The educational advantage, especially to the rural population, of cheap carriage of papers and even of advertising matter is incalculable. As the Postmaster-General says (Report, 1906, p. 6):

While it would be a gratifying circumstance if the Post-Office Department were self-sustaining, I am less concerned about the deficit than about efficiency of administration. The public demand for postal facilities is constantly growing. If the installation of the rural service had depended upon the existence of a surplus in the postal revenues under the existing system of accounting, that service could not have been given. The same considerations apply to a number of other branches. The financial returns from certain branches are so interwoven with and dependent upon others that there is much force in the contention that it is unreasonable to charge any one of them with the responsibility for the deficit.

3. Another somewhat similar reason for the deficit is the extent to which the post-office is saddled with expenses in carrying matter free for other departments of the government. Not only do government officials frank all kinds of material through the mails, but departments like that of Agriculture send matter by the wholesale. The Postmaster-General (Report, 1906, p. 272) estimates that if the post-office charged for this service, the revenues would be increased by approximately \$20,000,000 (about twice the actual deficit.) When Mr. Wanamaker was Postmaster-General, he said (1893):

Bundles of wire 6 feet high and 6 feet around, bags of seeds, supplies for the army, tons of documents packed in wooden cases that sometimes require three men to handle them, millions of blanks of the Census Office, are piled into the post-offices. . . . The reason for it is, that the Post-Office Department is compelled to carry anything sent under a penalty frank, and finally, franks are used by all the departments and their agents for the purpose of carrying everything they choose to send.

4. Finally, another main cause for the deficit is the failure of the post-office to enter domains of public service which are entered by all the main

postal systems of the world except that of the U. S., and which in most cases are immensely remunerative, tho done at low cost. We refer to postal savings-banks, postal telegraph and telephone service, and the postal parcels post. The reason why the U. S. post-office does not enter these domains is that,

Express Companies versus the United States

while the immense majority of the people desire that it should do so, and petitions to this effect have been signed by hundreds of thousands of voters, including most prominent public officials and some Postmaster-Generals themselves, the interests of private corporations carrying on banking, telegraph, telephone, and express have successfully lobbied in Congress to prevent or pigeonhole any bills looking in this direction. (See CORRUPTION, p. 322.)

Postmaster-General John Wanamaker in reply to a question about the parcels post said:

It is true that parcels could be carried at about one twelfth their present cost by the Post-Office Department, but you do not seem to be aware that there are four insuperable obstacles to the carrying of parcels by the U. S. Post-Office Department. The first of these is the Adams Express Company; the second is the American Express Company; the third the Wells-Fargo Express Company; and fourth, the United States Express Company.

PARCELS POST

What a large amount of business is carried on by the parcels post of almost all the great countries of the world, except in the U. S., is seen in the table on p. 929. The following table shows the comparative prices:

DOMESTIC POSTAGE ON PARCELS OF GENERAL MERCHANDISE

| | Austria | France | Germany | Great Britain | British Empire | United States (fourth class) |
|--------------------|------------------|--------|------------------|------------------|----------------|------------------------------|
| 7 pounds. | .12 | .12 | .12 | .18 | .48 | \$1.12 ¹ |
| 11 pounds. | .12 | .16 | .12 | .24 | .72 | 1.76 ² |
| 22 pounds. | .24 ¹ | .25 | .24 ¹ | .48 ¹ | ... | ... |

¹ In two packages.

² In three packages.

This was not always the case. Says *Postal Progress* (organ of the Postal Progress League, q. v.), to which we are indebted for these facts:

The U. S. parcels post of 1874, with its uniform rate of eight cents a pound, weight-limit four pounds, preceded the international parcels post of Europe and the domestic post of France by six years; that of Great Britain by nine years.

The tax now levied by Congress on the public for the postal transport of general merchandise is 100 per cent higher than the Post-Office Department deems advisable or necessary; 100 per cent higher than the old rate of 1874; 100 per cent higher than the sample parcels rate of the Universal Postal Union, and 25 per cent higher than our foreign parcels rate.

Our parcels post of 1899, the best, in 1907 is the worst of any of the great nations. Our general merchandise tax, in 1874, eight cents a pound, is now sixteen cents a pound.

The parcels post could be made of incalculable service, especially to rural communities, and bring in a large revenue to the government, as it does in other countries.

THE INTERNATIONAL PARCELS POST

The international parcels post of Europe was established in 1880, but the U. S. has not entered into it. A few especial postal conventions have

been made by the U. S. with a few countries at high rates, but international commerce and correspondence with the U. S. is heavily handicapped in this respect as compared with other countries. U. S. consuls and citizens residing abroad or having correspondents abroad have repeatedly complained of this. It is estimated that hundreds of millions of dollars of commerce are lost to the U. S. by its inability to send samples and produce at cheap rates to foreign countries (on account of the pressure of foreign countries, it is cheaper to send fourth-class matter abroad than at home). It was estimated by Consul Ayme in 1903 that the U. S. lost \$2,000,000 in orders from the West Indies alone by the lack of a cheap parcels post. The following table compares the parcels dispatched in the international mails by the U. S. and some of the progressive nations of Europe:

| | Number of parcels | Value |
|----------------------------|-------------------|-------------------|
| United States, 1906..... | 264,438 | Not stated |
| Germany, 1904..... | 11,675,385 | over \$23,000,000 |
| Austria, 1904..... | 10,659,300 | " 68,000,000 |
| France, 1904..... | 5,300,541 | " 20,000,000 |
| Switzerland, 1904..... | 1,694,200 | " 18,500,000 |
| Great Britain, 1905-6..... | 2,315,204 | " 18,000,000 |

The rates of the International Parcels Post compared with the U. S. general rate for foreign packages of eleven cents per pound is (as quoted in *Postal Progress*):

On parcels up to 11 pounds, for each country passed in territorial transit, 10 cents.

For maritime transit:

Distances up to 500 nautical miles, 10 cents; over 500 up to 1,000 nautical miles, 15 cents; over 1,000 up to 3,000 nautical miles, 20 cents; over 3,000 up to 6,000 nautical miles, 40 cents; over 6,000 nautical miles, 60 cents.

A surtax of 5 cents pays for customs formalities and delivery. A tax of 10 cents carries the parcel to its address by special messenger.

Any country of the union may fix the value limit of parcels handled in its international service, but in no case can it be less than \$100. In most cases the value is unlimited. The regular rates insure unregistered parcels up to \$5. Payment of a registration fee of 5 cents insures the registered parcel up to \$10, and an additional fee of 2 cents per \$60, for adjacent countries, 5 cents in other cases, insures the parcel up to its full value. The tax for collection on delivery cannot be over 4 cents per \$4, 1 per cent of the value collected.

Parcels over 3½ feet in any direction are subjected to an extra charge of 50 per cent.

This service now covers 33 countries of the Universal Postal Union, and includes a population of fully 500,000,000 people; but not the U. S. of America.

Of all progressive nations, too, the U. S. alone refuses to insure merchandise postal parcels.

The failure of the U. S. to enter the International Parcels Post has enabled the American express companies even to get exorbitant terms from foreign governments for delivering their parcel post matter in the U. S., so that to send a parcel to the U. S. from foreign countries a large price must be paid, a small portion of which goes to the foreign government for getting it to America and a large portion to some American express company for delivering it in America. One sees why the express companies have been interested in preventing the U. S. from entering the International Parcels Post. *Postal Progress* gives the following figures and comments as to the arrangement between the British Government and American express companies:

Post Express Rates, Great Britain.—To New York—3 lbs., 24c.; 7 lbs., 48c.; 11 lbs., 72c. To interior points—3 lbs., 50c.; 7 lbs., 75c.; 11 lbs., \$1.

American Parcels to Great Britain.—From New York—3 lbs., 49c.; 7 lbs., 55c.; 11 lbs., 70c. From interior points—3 lbs., 40c. + 25c., 35c., 40c., 45c.; 7 lbs., 55c. + 25c., 30c., 40c., 45c., 55c., 65c., 70c., 75c. (according to distance); 11 lbs., 70c. + 25c., 35c., 40c., 50c., 60c., 75c., 80c., 85c., \$1, \$1.10.

Plus similar charges for similar distances on every other express line over which the parcel passes, plus such other additional charges as the express company may levy for transport beyond its regular offices, plus or minus such discriminations as may be given in favor of prominent persons, merchants, manufacturers, or fruit-growers, whose influence, financial or political, may be sufficient to obtain special concessions.

Fees for Customs Formalities.—Postal fees—5c. Express post fees—48c.

Insurance.—Parcels post convention—10c., \$60; 30c., \$120; 55c., \$600. Express post arrangement—12c., \$60; 60c., \$120; \$1.20, \$600.

The express tax for customs formalities is nearly ten times the usual postal tax for a similar service. The express risk is from 20 to 100 per cent higher than the usual postal risk.

The British Government was forced into this post-express arrangement, because for a long time our government refused to make any parcels post arrangement with Great Britain and even now limits the reciprocal service to 4-pound 6-ounce parcels at 12 cents per pound. Note the express discriminations in favor of New York City, as against the rest of the country: 25 cents more on a parcel to interior points than to New York. Note also that on these British postal parcels the American Express Company charges but 25 cents for transportation, on parcels 3 to 11 pounds from New York to any interior point, while it charges four or five times as much in many cases on domestic parcels carried to the same point.

REFORMS ACTUALLY IN PROGRESS

What makes it the more evident that it is only the lobbying of the private interests of the railroads and the express companies which prevents the Post-Office Department from entering these progressive fields is that in matters apart from those conflicting with the railroads and companies, the U. S. post-office is both efficient and progressive—far more so, indeed, than private interests. Its efficiency is seen in the following from the report of the Postmaster General (1906, p. 6):

The efficiency of the service has been in many respects remarkable, as witness the record of the registry service for the half-century of its existence, showing a percentage of loss from all causes—including burglary, theft, and fire—for the fiscal year ended June 30, 1904, of only three one thousandths of 1 per cent. Some private business enterprises may in certain directions yield better financial returns, but they cannot show a higher standard of integrity nor more faithful performance of duty.

Repeatedly when the Western Telegraph Company fails to be able to deliver a telegram, it is able to deliver it through the post-office. The post-office is also more progressive than the Western Union Telegraph Company. The post-office is continually introducing improvements—the free-delivery system, money-order system, special delivery, railway post-offices, steamship post-offices, electric street postal cars, rural delivery, return postals, pneumatic tubes. These are but the larger reforms introduced by the post-office. What has the Western Union to show compared with this? It must be remembered, too, that the U. S. post-office carries a letter across the continent and to the smallest hamlet for two cents. The Western Union Telegraph Company, for a service actually costing less, charges often \$2 (for a telegram of anything like the length of a brief letter) or twenty-five cents for the shortest dispatch, the shortest distance outside of city limits. To most small hamlets the telegraph company gives no service. For the large cities and the large services like the newspapers and the pool-rooms, the telegraph companies (see GAMBLING) give a fairly adequate service. But the post-office is cheap, effective, and progressive for everybody (except

where private transportation interests have prevented it). It has far more offices, is open longer hours, pays its employees better, and serves the public in every way far better than the Western Union Telegraph Company. The aim of the post-office is public service; the aim of the private monopoly is private dividends. In international postal reform, also, progress is being made even by the U. S. The Universal Postal Congress which met in Rome (Italy), April, 1906, made the following changes, to go into effect Oct. 1, 1907:

(1) Reduction of the international letter rate of postage; (2) reduction of the rates to be paid to one country for transporting by its services the mails of another country in transit to a country beyond; (3) postal cards may bear a message on the left half of the front as well as upon the back; (4) an indemnity of 50 francs (\$10) must be paid for the loss of a registered article; (5) the postal administration of any country may sell to a person applying therefor a coupon in exchange for which upon its presentation at a post-office in another country the person presenting it shall receive a postage-stamp of the value of 25 centimes (5 cents), thus enabling a person in one country to furnish his correspondent in another country with a postage-stamp with which to prepay postage upon his reply letter; (6) postage-stamps perforated to show initials or other marks must be recognized as valid; (7) private postal cards need not bear the title "post card" or "postal card"; (8) correspondence of prisoners of war is free of postage in international mails, and (9) by reason of its insular possessions the U. S. is granted two votes in future postal congresses, instead of one as heretofore.

WHAT MIGHT BE

Postal Progress advocates an international rate of 2 cents per ounce on letters and 1 cent for 2 ounces on foreign general merchandise, with postal notes as universal bills of exchange, a perfect world's money.

For the nation, the post-office, it believes, should take charge of all transportation. It gives the following plan:

(1) The national government, under its constitutional power over post-roads, to take control of the entire business of public transportation, and to guarantee to the holders of transport securities a return on their investments equal to the average annual return of the past ten years, a similar return on their cost to be guaranteed on roads recently built. (This will insure absolute safety to the investments of savings-banks and similar associations. It will insure more than a square deal to railway speculators.)

(2) The maintenance, extension, and operation of the consolidated system to be under the control and management of an extended postal department, including the engineering corps of the army and navy; all postal employees to be enlisted as men are now enlisted in the army and navy. The government engineers entrusted with the building and maintenance of the Panama Canal may be safely entrusted with the care of all our public highways. To prevent waste, the post-road policy of the national government should be the same as the highway policy of the different states, viz.: Any community, town, county, or state, asking for an extension of post-roads, should pay some share of the cost. Local roads may, perhaps, be left to local control, as local roads are now left to the care of the smaller communities within the different states. But the whole business must be under the general jurisdiction of the national government.

(3) As to funds, U. S. 2 per cent thirty-year bonds are worth 105. The nation will find no difficulty in raising money to build and maintain its own roads. It is a most wasteful policy to pay the Harrimans and the Hills 8 or 10 per cent, or more, for money to build the highways of the people, when the people themselves are glad to furnish the national government with funds at less than 2 per cent. Every additional mile of post-road, moreover, will raise the public credit, for to its own value will be added the increased value of the district which it serves.

(4) Make the very lowest less than car-load rate on merchandise the uniform rate for the station-to-station service, adding thereto the lowest possible rate for collection and delivery, to the end that we may have a universal door-to-door rate within the entire public service.

A door-to-door rate of 1 cent a pound or less on small merchandise parcels, 25 cents on 100-pound parcels, may be found quite practicable, once our public transport service is brought under the post-office. On products usually trans-

ported in ton lots—coal, brick, ore, etc.—a rate of 40 or 50 cents per ton, station to station, with corresponding rates for collection and delivery, may suffice to meet the situation. "There should be no wholesale rates as against retail rates, no more so than in buying postage-stamps."—Hon. L. S. Coffin, *Late Railroad Commissioner of Iowa*.

Passenger fares: Local traffic with frequent stops, five cents per trip. Express traffic, stops every fifteen or twenty miles, twenty-five cents per trip. Through traffic on fast trains, stops once in forty or fifty miles, \$1 per trip, with reasonable charges for transport between the home and the station.

The possibilities as to low transport rates under a well-ordinated system of transportation are altogether beyond imagination. It is estimated that a saving of fully \$50,000,000 a year could be made in the transport service of the city of New York alone, if the entire business were in the hands of one well-equipped organization, run in the public interest. Vice-president Buckland, of the N. Y. N. H. & H. R. R., is quoted as saying that \$15,000,000 a year could be saved to the people within his railroad province under a door-to-door freight transport service undertaken by the railroad in connection with the trolley lines.

POVERTY (see also **PAUPERISM** AND **POOR RELIEF**; **POOR-LAWS** (English)): We consider in this article: (1) the facts and statistics of poverty; (2) the social effects; (3) the causes; (4) methods of relief.

I. Facts and Statistics

Statistics of poverty do not and probably cannot exist in any exact form, first, because there is no exact standard of poverty, and secondly, because in no country are there any official or generally complete returns as to the whole number of the poor. In most countries there are statistics as to the number receiving public relief, and to a less extent as to those in receipt of private charity, but even this is not complete, while there are undoubtedly in all countries at least some who must be called poor, since they are without the means to adequately support family life, who, for one reason or another, never receive any aid, while in all countries the number of those out of work at least a portion of the time, and therefore out of the means of subsistence, is by no means small. How many poor, therefore, there are in any country, no man knows. We have but estimates and approximations.

The estimates usually given vary with the meaning given to the word "poor." Some mean by it those in receipt of public relief; but these are "paupers." Others mean by it those in receipt of any kind of public or private relief; but "dependents" is a better term for this class. Others mean by it those in need of such relief; whether they receive it or not, a more philosophical use, but practically limiting the word to the class in *permanent* need of relief—the class unable to support itself, or at least not supporting itself—and do not include in the number the temporarily unemployed or unfortunate. Others mean by the word any who for any reason, for any appreciable period, are not in receipt of enough income to maintain life and renew it, on the plane of bare existence on the present social plane. In Charles Booth's investigations as to life and labor in London, he found it necessary to adopt a standard for the measure of poverty and he defined the poor as "those living in a state of struggle to obtain the necessities of life"; the very poor being "those who live in a state of chronic want." He divides the very poor into the lowest class of occasional laborers, loafers, or semicriminals and those with only casual earnings. The poor he divides into those with intermittent earnings and those with small irregular earnings. He says that "it is clear that in studying the problems of poverty, we have

to deal not alone with those who claim public relief as paupers, or who claim private charity as beggars, but with the great army from which these classes are constantly recruited, the army of those who live at or under the line of poverty—a great army living at a deprest rate of life, and tending to reduce the vitality of the whole population.

THE UNITED STATES

The number of paupers in almshouses in the U. S. in 1903, as reported by the census, was 81,764. (See PAUPERISM.) But this is only one class of the poor in any country.

Professor Bushnell, in Professor Henderson's "Modern Methods of Charity," says that "the total number of public and private abnormal dependents in the U. S. must not be far from 3,000,000, or one twenty-fifth of the total population of the country at an annual expense of nearly \$200,000,000, or one tenth of the total wage income of all the manufacturing establishments of the country."

THE NUMBER OF DEPENDENTS, DELINQUENTS, AND DEFECTIVES RECEIVING PUBLIC AID OR SUPPORTED BY PRIVATE CHARITIES, ESTIMATED BY PROF. C. J. BUSHNELL, FROM STATE REPORTS, IN PROFESSOR HENDERSON'S "MODERN METHODS OF CHARITY," pp. 385-390.

| STATE | Number | Per cent of population | Annual expense | Expense per family |
|------------------|-----------|------------------------|----------------|--------------------|
| Massachusetts... | 415,730 | 14. | \$12,121,696 | 23.51 |
| Connecticut.... | 100,000 | 11. | 4,000,000 | 28. |
| New York..... | 160,000 | 2. | 25,000,000 | 18.00 |
| Pennsylvania... | 110,000 | 1.7 | 26,000,000 | 30.00 |
| Ohio..... | 100,000 | 2.4 | 5,034,886 | 13.00 |
| Michigan..... | 100,000 | 4. | 849,125 | |
| Wisconsin..... | 15,000 | 0.7 | 1,000,000 | 3-4.00 |
| California..... | | | 2,667,000 | 10.00 |
| Total..... | 1,000,730 | 4. | \$75,672,707 | |

In comparing these figures with those of other states it must be remembered that they are for those receiving public aid or reported by private charities. Many more received unreported charity. The high percentages for Massachusetts and Connecticut are therefore partly due to a more complete registration of private charities and more largely, probably, to the fact that in the East dependents are more generally placed in institutions, than in the West, where institutions have not been equally developed. Many Eastern and far Western cities give no outdoor relief. Higher percentages, therefore, may not always mean more paupers, but better care for them.

This number of 3,000,000 receiving reported aid is the same number estimated in 1890 by Charles D. Kellogg, then secretary of the New York Charity Organization Society, and by Prof. R. T. Ely (*North American Review*, April, 1891). But these figures are only of those receiving known aid. It by no means includes all the poor according to Mr. Booth's definition. Using the word in that sense, Mr. Robert T. Hunter estimates the total number of the poor in the U. S. at 10,000,000. (See special article, POVERTY IN THE U. S.) Of New York State, the wealthiest, he says: "In 1899 18 per cent of the people in New York State received public or private charity. In 1903 14 per cent of the families of Manhattan were evicted. Every year about 10 per cent of those who die in Manhattan have pauper burial."

GREAT BRITAIN

The number receiving public relief in Great Britain (besides those receiving private charity or not receiving relief) is 1,142,357.

Says a Fabian tract (1906):

We clog our public poor relief with irksome and degrading conditions, so that the honest poor often die lingering deaths rather than accept it. Mr. Charles Booth states that "as regards entering the workhouse, it is the one point on which no difference of opinion exists among the poor. The aversion to the 'house' is absolutely universal, and almost any suffering and privation will be endured by people rather than go into it" ("The Aged Poor in England and Wales"). Yet the paupers in actual receipt of public relief on one day number more than a million:

| | Number | Cost |
|-------------------------------------|-----------|-------------|
| England and Wales, Jan. 1, 1905.... | 932,267 | £13,369,494 |
| Scotland, Jan. 15, 1904..... | 106,850 | 1,302,061 |
| Ireland, Jan. 7, 1905..... | 103,240 | 1,033,168 |
| | 1,142,357 | £15,704,723 |

(Report of Local Government Board, England and Wales, Cd—2,661; Report of Local Government Board, Scotland, Cd—2,514; Report of Local Government Board, Ireland, Cd—2,655.)

But these are by no means all the poor. The Fabian tract gives the following statements from authorities:

Nine hundred and thirty-nine out of every 1,000 persons (about half of whom are adults) die without property worth speaking of, and 961 out of every 1,000 without furniture, investments, or effects worth £300 (Mullhal, Dictionary of Statistics, from Probate Duty Returns, p. 279).

From returns obtained from 8,121 private and government works, employing 862,365 persons, it appears that the average annual wage per head amounted to only £48. These returns include the police and other public servants, but do not take any account of agricultural and general laborers (Annual Report of Labor Department, Board of Trade, 1893-1894, C—7,565).

B. S. Rowntree estimated that the average income from all sources of the 11,560 working-class families in York in 1899 was 38s. 8d. per week, or £5 a year. But 1,465 families, comprising 7,230 persons, that is, 15.46 per cent of the wage-earning class and 9.91 per cent of the population of York, were living in "primary poverty," that is, on less than enough to provide the minimum of food, clothing, and shelter. And, in addition, 13,972 persons, or 17.93 per cent of the population, were living in "secondary poverty," that is, on earnings which would be sufficient if spent with rigid economy and perfect wisdom, but were insufficient because in part mispent on drink and betting or through ignorant housekeeping. "The wages paid for unskilled labor in York are insufficient to provide food, shelter, and clothing adequate to maintain a family of moderate size in a state of bare physical efficiency." No less than 52 per cent of "primary" poverty was due to low wages alone ("Poverty," 2d ed., pp. 83, 120, 133).

Of the great permanent army of the "unemployed," no reliable statistics can be obtained. From returns rendered to the Labor Department of the Board of Trade by trade-unions, it appears that in the seven years, 1896-1902, the mean percentage of members unemployed was 3.3 (Annual Report of Labor Department, Board of Trade, 1901-2, Cd—1,755). The average number of persons in London whose home is the "common lodging-house" is over 30,000; over 1,100 are every night found in the "casual wards."

As regards the 4,000,000 persons in the metropolis, Mr. Charles Booth tells us that 37,610, or 0.9 per cent, are in the lowest class (occasional laborers, loafers, and semicriminals); 316,834, or 7.5 per cent, in the next (casual labor, hand-to-mouth existence, chronic want); 938,293, or 22.3 per cent, form "the poor" (including alike those whose earnings are small, because of irregularity of employment, and those whose work, tho regular, is ill paid). These classes, on or below the "poverty line" of earnings not exceeding a guinea a week per family, number together 1,292,737, or 30.7 per cent of the whole population. To these must be added 99,830 inmates of work-houses, hospitals, prisons, industrial schools, etc., making altogether nearly 1,400,000 persons in this one city alone whose condition even the most optimistic social student can hardly deem satisfactory ("Labor and Life of the People," edited by Charles Booth, 1891, vol. II., pp. 20-21).

The ultimate fate of these victims it is not easy adequately to realize. In London alone, in 1902, no less than 34 persons, of whom 24 were fifty years old and upward, were certified by the verdicts of coroners' juries to have died of starvation, or accelerated by privation (H.C.—279). Actual starvation is, however, returned as the cause of death in but a few cases annually; and it is well known that many thousands of deaths

London's Poverty

are directly due to long-continued underfeeding and exposure. Young children especially suffer.

In England and Wales, in 1904, 90,776 deaths were registered as having taken place in workhouses, infirmaries, hospitals, and asylums, or 16.51 per cent of the total deaths; the proportion during the ten years immediately preceding having averaged 14.25 per cent. Of these, 48,884 occurred in workhouses, 32,141 in hospitals, and 9,751 in lunatic asylums.

In London, in 1904, one person in every three died in the workhouse, hospital, or lunatic asylum. Out of 75,558 deaths, 31,513 being under twenty years of age, 13,845 were in workhouses, 10,806 in hospitals, and 504 in lunatic asylums, or, altogether, 25,155 in public institutions (Registrar-General's Report, 1904, Cd—2,617).

It is worth notice that a large number of those compelled in their old age to resort to the workhouse have made ineffectual efforts at thrifty provision for their declining years. In 1890-91, out of 175,852 inmates of workhouses (one third being children, and another third women), no fewer than 14,808 have been members of benefit societies. In 4,593 cases the society had broken up, usually from insolvency (House of Commons Return, 1891, Nos. 366 and 130—B). It is probable that one in every three London adults will be driven into these refuges to die, and the proportion in the case of the "manual-labor class" must of course be still larger. And the number of persons who die while in receipt of outdoor relief is not included in this calculation. As in 1902-3 the mean number of outdoor paupers in the metropolis was 44,899 (Cd—1,700), and the average death-rate in London was 18.7 per 1,000, it may be assumed that upward of 1,000 persons died while in receipt of outdoor relief—often from its being insufficient.

For other countries, see those countries.

II. The Effects of Poverty

We quote upon this point from a classic statement, written by Mr. Ira Steward, the father of the eight-hour philosophy, and published in the "Fourth Annual Report of the Massachusetts Bureau of the Statistics of Labor" (1873). He says:

Poverty is the great fact with which the labor movement deals. The problems that now most disturb and perplex mankind will be solved when the masses are no longer poor. Poverty makes the poor poorer, and independence impossible. It corrupts judges, ministers, legislators, and statesmen. It decides marriages, shortens human life, hinders education, and embarrasses progress in every direction. It gives rise, directly and indirectly, to more anxiety, suffering, and crime than all other causes combined. Poverty crams cities, and their tenement-houses, with people whose conduct and votes endanger the republic. The dangerous classes are always poor. There is a closer relation between poverty and slavery than the average abolitionist ever recognized. . . . The anti-slavery idea was that every man had the right to go and come at his will. The labor movement asks how much this abstract right is worth, without the power to exercise it. . . . The laborer instinctively feels that something of slavery still remains, or that something of freedom is yet to come, and he is not much interested in the anti-slavery theory of liberty. He wants a fact, which the labor movement undertakes to supply.

But has not the middle class its poverty—a poverty that should excite the most anxiety, and the most searching inquiry? They are a large majority of the people, and their poverty is generally carefully concealed. . . . The middle classes have the strongest motives for never making any parade or public complaint of their poverty.

Poverty Affects All

To advertise oneself destitute, is to be without credit. . . . Poverty that publishes or argues one's incapacity closes many a door to more profitable or advantageous situations or promotions. The more expensive and superior style of living adopted by the middle classes must, therefore, be considered in the light of an investment, made from the soundest considerations of expediency. . . . Very few among them are saving money; many of them are in debt; and all they can earn for years is, in many cases, mortgaged, to pay such debt—"debt that increases the load of the future, with the burden which the present cannot bear." . . . The poverty of the great middle classes consists in the fact that they have only barely enough to cover up their poverty, and that they are within a few days of want, if through sickness or other misfortune employment suddenly stops. . . .

But the most alarming fact concerning the poverty of the native middle classes in this commonwealth is that, for two or three decades past, marriages and births have so far decreased among them that we are nearly or quite justified in saying that they are now dying faster than their children are being born; and that it is to foreign sources (and to Amer-

icans born in other states), and to the lower class of native-born, we must credit the present increase in our census returns. . . . With the mass of intelligent people, early or late marriages, and few or no children, is largely a question of poverty and wealth. . . .

Poverty, however, falls most crushingly on woman. In all countries, and in all ages, among the lower and middle classes, she has worked harder, and for less pay, than men. A woman who has no resources for a living except from the labor of her own hands is tolerably sure to become in time, either the poor man's slave, or the rich man's plaything; to marry for a home, or do worse. To make prostitution unnecessary is a part of the problem of social science; but prostitution means getting a living. The science that will solve this problem will easily dispose of war, intemperance, financial convulsions, and a dozen other evils that now disturb the peace of the race. Poverty is the mainspring of selfishness, for it is the destitution of the mass of mankind that prevents them from thinking and doing for others; As Mill says, "all their thoughts are required for themselves." . . . The two classes most peculiarly open to the temptation of intemperance are the very poor and the very rich young men. . . . The steps of some young men turn finally to the light, warm, welcome saloon, not from force of appetite, for they have never yet drunk enough to create the craving for stimulating beverages, nor because it is fashionable, for their wages are not sufficient to lift them up to that level; but because they are without homes, and are starving for society.

The sons of the wealthy have homes, and all that money can bring for their entertainment. But in many cases they have nothing whatever to do. They are corrupted by idleness, and it is their extreme wealth that makes their hours of idleness possible. . . . The most terrible of all stagnations is idleness. It means moral and social rottenness, and intemperance is only a single manifestation of it. . . .

No one is fully educated until the discipline of hard labor has been added to the culture of books, travel, and good society, and, on the other hand, no one is educated who has had no chance to learn anything but to work hard and steadily, and to "know his place." . . . The law of "supply and demand," so often quoted as regulating wages and prices, means nothing, more nor less, than the great fact of the poverty of the poor, and the power and comparative independence of the wealthy. . . . Starving men will always bid for wages at starvation prices. . . . The law of supply and demand is said to regulate the price of commodities, but the "demand" is limited by the great fact of the poverty of the mass of consumers. . . . "A glut in the market" has never yet meant anything more than that millions of people are too poor to pay for the food, clothes, houses, books, and opportunities that are waiting for customers. . . .

It is poverty that compels one man to borrow of another, and the price paid for the use of the money loaned is what we call interest—so that interest on money is poverty again. . . . It is the enormous profits made directly upon the labor of the wage classes, and indirectly through the results of their labor, that, first, keeps them poor, and, second, furnishes the capital that is finally loaned back to them again. . . .

It is clear that the large fortunes accumulated by the wealthy can only be defended upon the theory that their services are actually worth the compensation they receive. Are their services worth the price charged? If it is fair to ask hands how much they could do without brains, it is just as fair to ask brains how long they could live without hands. The alternative presented to mankind, in case the services of managers were withdrawn, is a reduced rate of production, which means poverty. But, on the other hand, the alternative presented to those who manage labor, in case the so-called brainless workers were withdrawn, is death, or hard work with their own hands, for fields were never tilled, nor houses reared, nor garments made, nor food cooked, without manual labor. . . .

Poverty Causes Low Wages

The capital of the capitalist is not simply the wealth he has somehow acquired, tho this is, indeed, a very important part of his capital. The other part, without which the first would be worthless, and to which the political economist seldom, or never, refers, but to which we now call special attention, is the great and terrible fact of the poverty of the masses. It is their poverty, destitution, and consequent dependence, that compel them, every day of their lives, to make the best terms possible with those who hold in their possession the surplus wealth of the world. . . .

III. Causes of Poverty

These are of necessity so numerous and complex, that sociologists to-day no longer attempt to analyze them or even state them, and much less venture opinion as to how far different causes contribute to the result. (The most that can be done, scientifically, is to say that such and

such causes tend to produce poverty, and that some causes seem to be more potential than others. Life as it affects poverty is seen to-day to be too complex for statistical or any form of exact analysis.

Perhaps the nearest approach to a scientific tabulation and valuation of different causes is the one made in 1894 by Prof. A. G. Warner, and published in his "American Charities." He has collected and tabulated the results of investigations into the causes of thousands of actual cases of poverty in the U. S., England, and Germany. His table includes practically all the findings, as to actual cases of poverty, made in a scientific way by trained investigators; and embodies the results of investigations by the charity organization societies of Baltimore, Buffalo, and New York City, the associated charities of Boston and Cincinnati, the studies of Charles Booth in Stepney and St. Pancras parishes in London, the statements of Böhmert ("Armenwesen in 76 Deutschen Städten") for seventy-six German cities, published in 1886. It will be seen that here, if anywhere, we have a scientific analysis of the facts of the case, as collected by persons without particular bias.

We quote on p. 937 only his percentages. The conclusions and especially the averages of the table, however, should not be used without reading the explanations that follow it.

Of this table Professor Warner says (pp. 36, 37):

The first duty of one presenting such a table as this is to indicate clearly what it does not show. It deals, as already indicated, only with the exciting causes of poverty; and yet this fact is not kept clearly in mind, even by careful workers. Mr. Booth, for instance, includes "pauper association and heredity" in this list of causes; and the American societies include "nature and location of abode." Both of these are by their nature predisposing causes, rather than immediate or exciting causes; and it is confusing to mix the two. Secondly, many of the persons whose cases are here tabulated have been, as Mr. Booth says, the football of all the causes in the list. Under such circumstances to pick out one cause, and call it the most important, is a purely arbitrary proceeding. Any one of the causes might have been inadequate to produce pauperism, had not others cooperated with it. A man is

drunk and breaks his leg; is the cause "accident" or "drink"? When this question was submitted to a group of charity organization workers, it was very promptly answered by two of them: but their answers were different. A man has been shiftless all his life, and is now old; is the cause of poverty shiftlessness or old age? A man is out of work because he is lazy and inefficient. One has to know him quite well before they can be sure that laziness is the cause. Perhaps there is hardly a single case in the whole 7,000 where destitution has resulted from a single cause. . . .

The impossibility of giving an accurate statistical description of the facts is still clearer when we try to separate the causes indicating misconduct from those indicating misfortune. Back of disease may be either misconduct or misfortune. The imprisonment of the breadwinner indicates misconduct on his part, but may only indicate misfortune on the part of wife and children. The same is true in the case of abandoned children and neglect by relatives. This particular classification is made in deference to popular inquiry only. In the writer's opinion its chief value consists in showing how little it is worth.

But after all possible allowance has been made for the "personal equation" of the investigator, and for all the inevitable inconclusiveness of the figures, there is a residuum of information to be got from the tables. They give, as well as such statistics can, the conclusions reached by those who are studying pauperism at first hand. If the figures furnished by all the investigators were added together into one great total, and this only were put before him, the author would indeed hesitate to base any conclusions whatever upon it. But when it is found that different investigators, at different times, in different places, reach conclusions which, while varying in many and often inexplicable ways, are yet in agreement as regards certain important facts, we can but think that the figures to some extent reflect actual conditions.

It will be seen from this table that the chief single cause of poverty, as here studied, is sick-

ness or death in the families of the poor. Lack of work stands second, altho, if the averages as to lack of work, insufficient work, and poorly paid work be added together, as well they might be, they form the supreme cause of poverty. Drink stands third, tho only one half as great a cause as unemployment. Says Professor Warner (pp. 60 and 65):

Probably nothing in the tables of the causes of poverty, as ascertained by cold counting, will more surprise the average reader than the fact that intemperance is held to be the chief cause in only from one fifteenth to one fifth of the cases, and that where an attempt is made to learn in how many cases it had a contributory influence, its presence cannot be traced at all in more than 28.1 per cent of the cases. (See INTemperance.) Professor Warner sums up the case by saying: "The general conclusion regarding drink as a cause of poverty is sufficiently well formulated by Mr. Booth. 'Of drink in all its combinations, adding to every trouble, undermining every effort after good, destroying the home and cursing the young lives of the children, the stories tell enough. It does not stand in apparent chief cause in as many cases as sickness and old age; but if it were not for drink, sickness and old age could be better met.'"

It will also be seen from the table that causes indicating misconduct average only 21.3 per cent, while causes indicating misfortune average 74.4, or over three times as much. Four per cent of the cases are not classified; but the causes indicated as unclassified belong to causes indicating misfortune much more than misconduct, at least as far as the individual studied is concerned. How far poverty is the result of other people's misconduct or hereditary misconduct is not here shown. But as for the persons immediately concerned, misfortune is shown to be nearly four times as much the cause of poverty as their misconduct.

This seems to be the most careful analysis of the causes of poverty yet made; but not all will accept its conclusions. Certain schools of thought are apt to find the especial evil they attack the main cause of poverty. (See SINGLE TAX; TEMPERANCE; MALTHUSIANISM.)

Mr. Robert Treat Paine, in an address read at the International Congress of Charities, Correction, and Philanthropy, at Chicago, in 1893, said:

Has not the new charity organization movement too long been content to aim at a system to relieve or even uplift judiciously single cases without asking if there are not prolific causes permanently at work to create want, vice, crime, disease, and death; and whether these causes may not be wholly or in large degree eradicated? If such causes of pauperism exist, how vain to waste our energies on single cases of relief, when society should rather aim at removing the prolific sources of all the woe.

The four great causes of pauperism and of degraded city life have long seemed to me to be these: 1. Foul homes. 2. Intoxicating drink. 3. Neglect of child life. 4. Indiscriminate almsgiving.

Mr. Charles Booth counts up twenty-three principal causes of pauperism ("Pauperism and the Endowment of Old Age," p. 9):

"Crime, vice, drink, laziness, pauper association, heredity, mental disease, temper, incapacity, early marriage, large family, extravagance, lack of work, trade misfortune, restlessness, no relations, death of husband, desertion, death of father or mother, sickness, accident, ill luck, old age." He says, "that, as causes, old age stands first, sickness next, and then comes drink" (p. 148).

Among 1,610 cases, however, of the poor and very poor in London, he shows 4 per cent due to "loading," 14 to drink, 27 to illness, large families, or other misfortunes, 55 to "questions of employment" ("Labor and Life of the People,"

vol. i., p. 147). A large part of this lack of employment may be among the old.

Mr. J. G. Godard, in his "Poverty, Its Genesis and Exodus," argues that waste of wealth, poverty itself, are prominent causes of poverty, but that the main cause is unequal distribution. He argues that men must be poor, either because there is not enough produced for all, because some of it is wasted, or because some get too much. He shows for England that, tho relatively the number of the poor is somewhat less to-day than it was, the annual wealth produced is nearly double what it was three generations ago, and "never in the whole history of England, excepting during the disastrous period at the beginning of the century, has the absolute number of the very poor been so great as it is now" (J. A. Hobson's "Problems of Poverty," p. 26, 1891). Is there then, he asks, not enough produced? He shows that the total annual income of the United Kingdom in round numbers may be placed at £1,350,000,000 (Mr. Giffin, in his "Essays on Finance," vol. ii., pp. 460-472, estimating it in 1886 at £1,270,000,000). Dividing this by the population of the census returns for 1891 (37,740,283), he gets £35 per annum (£175) for each individual, or £175 (\$875) for each family of five. He says, "Insufficient production of wealth may then be regarded as an actual cause of poverty, but one of minor influence." A more important cause of poverty he considers to be the waste of wealth. He quotes Professor Marshall as saying ("Principles of Economics," vol. i., p. 731), "Perhaps £100,000,000 annually are spent even by the working classes, and £400,000,000 by the rest of the population of England, in ways that do little or nothing toward making life nobler or truly happier." This means a waste of over one third of the whole. Poverty itself, he shows, causes much poverty. It checks profitable production; it causes large amounts of waste; leads to unequal distribution, compelling the poor to work for low wages. But, above all, he considers unjust distribution the main cause of poverty. He says (giving authorities for his conclusion), "One thirty-eighth of the population possess on the average £5,000 per head, and thirty thirty-eighths of population possess on the average £6 per head. Inequality of distribution can scarcely be carried much further." Of the annual income he says: "Thirty million weekly wage-earners obtain £500,000,000 only; the remaining 8,000,000 persons thus receiving £850,000,000. This means that the average annual income of the one class is less than £17 per head, and the average annual income is more than £106 per head." (For other statements on this point and for authorities, and for similar facts as to the U. S., see WEALTH.)

Unequal Distribution

IV. Methods of Relief

For what is being done in various countries directly to relieve poverty, see article PAUPERISM AND POOR RELIEF. For what is being done indirectly, but perhaps quite as effectively, see the various measures, CHARITY ORGANIZATION SOCIETY; OLD-AGE PENSIONS; LABOR COLONIES; GARDEN CITIES; HOUSING QUESTION; UNEMPLOYMENT; PAWN-SHOPS; TEMPERANCE; SETTLEMENT; INSTITUTIONAL CHURCHES; TRADE-UNIONS; SINGLE TAX; SOCIALISM, etc. We consider in this section simply the principal general methods or varieties of relief which have been proposed.

Mr. Charles Booth (q. v.), who perhaps has studied the facts of modern city poverty as carefully as any other one man, divides the residents of the poorer sections of London into eight classes and then states his principal method of relief. His classification and proposals are as follows:

(A) The lowest class of occasional laborers, loafers, and semicriminals; (B) the very poor, with casual earnings; (C) those of intermittent earnings; (D) of small regular earnings; (E) those of regular standard earnings, above the line of poverty; (F) the higher classes of laborers; (G) the lower middle class; (H) the upper middle class. Class A he thinks could be "harried out of existence" ("Life and Labor of the People," vol. i., p. 169). Class B he thinks presents the main problem. It is *de trop*. The competition of B drags down C and D, and that of C and D hangs heavily upon E. We gain nothing from B. All that B does could be done by C and D in their now idle hours. . . . To bring Class B under State regulation would be to control the springs of pauperism. Hence he would put them under State control. He says: "These people should be allowed to live as families in industrial groups, planted wherever land and building material

were cheap, being well housed, well fed, and well warmed; and taught, trained, and employed from morning to night on work indoors and out, for themselves or on government account; in the building of their own dwellings, in the cultivation of the land, in the making of furniture. . . . There would be no competition with the outside world. . . . What is the poor-law system? It is a limited form of socialism—a socialistic community (aided from outside) living in the midst of an individualist nation. My idea is to make the dual system, socialism in the arms of individualism, under which we already live, more efficient by extending somewhat the sphere of the former, and making the division of function more distinct. Our individualism fails because our socialism is incomplete. In taking charge of the lives of the incapable, State socialism finds its proper work, and by doing it completely would relieve us of a serious danger."

More recently Mr. Booth, in his "Pauperism and the Endowment of Old Age," finding pauperism largely a problem of the aged (see above), has proposed a vast scheme for pensioning all aged persons. (See OLD-AGE PENSIONS.)

The Rev. Samuel Barnett, of St. Jude's, White-chapel, London, warden of Toynbee Hall, is even more radical. He says ("Practicable Socialism," revised edition, pp. 101-107):

Individuals have given their money and their time, their failure is notorious, and societies have been formed to direct their efforts. The failure of these societies is not equally notorious, but few thinkers retain the hope that societies will reform society and make the conditions of living such that people will be able to grow in wisdom and in stature to the full height of their manhood. If it were a sight to make men and angels weep, to see one rich man struggling with the poverty of a street, making himself poor only to make others discontented paupers, it is as sad a sight to see societies hopelessly beaten and hardened into machines with no reach beyond their grasp. The deadness of these societies or their ill-directed efforts have roused, in the shape of charity organization workers, a most striking missionary enterprise. The history of the movement as a mission has yet to be written; the names of its martyrs stand in the list of the "unknown good," but the most earnest members of a charity organization society cannot hope that organized almsgiving will be powerful so to alter conditions as to make the life of the poor a life worth living. Societies which absorb much wealth, and which relieve their subscribers of their responsibility, are failing; it remains only to adopt the principle of the education act, of the poor-law, and of other socialistic legislation, and call on society to do what societies fail to do.

There is much which may be urged in favor of such a course. It is only society, or to use the title by which society expresses itself in towns, it is only town councils which can cover all the ground and see that each locality gets equal treatment. . . . The first need is better dwellings. . . . Insanitary conditions and high rents are the points to which consideration must be directed. . . . Wise town councils, conscious of the mission they have inherited, could destroy every court and crowded alley, and put in their places healthy dwellings; they could make water so cheap, and bathing places so common, that cleanliness should no longer be a hard virtue; they could open playgrounds and take away from a city the reproach of its gutter children; they could provide gardens, libraries, and conversation rooms; they could open picture-galleries and concerts; they could light and clean the streets of the poor quarters; they could give medicine to heal the sick, money to the old and poor, a training for the neglected, and a home for the friendless. The first practical work is to rouse the town councils to the sense of their powers; to make them feel that their reason of being is not political but social, that their duty is not to protect the pockets of the rich, but to save the people. . . . If it be urged that when town councils do for social reform all which can be done, the condition will still be unsatisfactory, I agree; . . . no social reform will be adequate which does not touch social relations, bind classes by friendship, and pass through the medium of friendship the spirit which inspires righteousness and devotion. If therefore the first practical work of reformers be to rouse town councils, their second is to associate volunteers who will work with the official bodies. . . . As a rule it may be laid down that the voluntary work is most effective which is in connection with official work. . . . Teetotal advocates will preach in vain that drunkenness is the root of all evil, and that a nation of abstainers will be either a healthy, a happy, or a thoughtful nation. Thrift will be seen to be powerless to do more than to create a smug and transient respectability. . . . The nationalization of luxury must be the object of social reformers.

Mr. Robert Treat Paine, of Boston, Mass., president of the Associated Charities of that city

Views of Charles Booth

Views of Canon Barnett

since 1878, in the address above quoted, opposes Mr. Booth's plan, but is almost equally radical. He says:

The problem of poor relief in great cities has got to be restated in ampler terms. The diseases of society are more aggravated, the dangers are graver, the need of radical remedies is more absolute than the new charity has yet fully and fairly faced.

**Robert
Treat Paine**

When the poor sink below their poverty into pauperism, and pauperism becomes hopeless and degraded and brutal; when powerful and prolific causes are at work to swell the rising tide—the day has gone when it is enough to go on dealing with details.

Pauperism is assuming a new and more terrible type in the largest cities, where paupers have lived so long in this condition that they know nothing better. . . . Strong drink is almost the sole solace of their dull routine.

Crimes of violence, crimes of lust, crimes against property not only prevail, but cease to shock, where the general level of life has lapsed into a new phase of barbarism.

What hope for boys and girls growing up in such atmosphere of sin, in overcrowded cities from which playgrounds have been excluded by rising rents; playgrounds for the innocent outpouring of the boys' animal spirits which will have some vent, if not in hockey and football, then in breaking into empty buildings, stealing lead pipes, and stoning dispensary doctors or police with even-handed delight. . . .

With population rents rise so that the average man—that is, the mass of the people—is forced to live in utterly unfit homes, fearfully overcrowded; hence, low vitality of body and soul, diseased morals, and diseased bodies. . . .

Repression alone is a failure. . . . In some cities all these evils are aggregated into great masses.

Merely to deal, no matter how wisely, with single cases of distress or crime, as they arise, is infinitely insufficient. . . .

In the largest cities, where conditions are worse and the evils of pauperism, grown chronic and contagious, are blended with habits of drunkenness and other vice, breaking out into crimes against the law, pauperism cannot wisely be considered alone, but the problem of how to uplift the general level of life must be studied as one whole problem, especially as to the causes of the evils. . . .

The methods of dealing with pauperism hitherto applied are impotent against this swelling tide of brutal, degraded pauperism. . . .

"Who does not know," says Prof. H. C. Adams, "that much of our so-called philanthropy tends to perpetuate those conditions which seem to make philanthropy necessary?" Prof. W. G. Tucker, in his Phi Beta oration at Harvard, June, 1897, compels us to seek more radical cure, by more radical measures, when he says: "The philanthropy which is content to relieve the sufferer from wrong social conditions, postpones the philanthropy which is determined at any cost to right those conditions." . . .

Pauperism, vice, and crime are common factors of the inseparable and tremendous problem how to uplift the general conditions of life among the poor.

Mr. Paine then states what he believes to be the causes of poverty (see above) and then says:

Which of the two causes dragging down the conditions of life among the masses, foul homes or intoxicating drink, is more potent, I do not know. Each leads surely to the other.

Everywhere the conviction gains ground that it is impossible to elevate the conditions of the lower class of working people above the condition of their homes.

Boards of health probably have power in all cities to vacate dwellings unfit for human habitation. . . . All that is needed is aroused public interest to learn the unspeakable horrors of the homes of the wretched poor to-day, and then to insist on a higher standard of habitability.

Boards of health will follow the public command and the public conscience. . . .

Three agencies directly deal with the task of fitly housing the people:

1. Philanthropic agencies which aim to improve the condition both of tenants and of the tenements they occupy.
2. Economic agencies providing decent homes, often in model buildings.
3. Municipal agencies aiming to abolish the worst evils and to destroy foul homes.

High above each and all of these three agencies in its influence and promise of grand results I place the rising ambition of working men themselves to own their own homes. . . .

If this laudable ambition is lacking among the lowest class, so also do both of the powerful agencies at work to provide model homes, whether by philanthropic or invested capital of which I have just spoken, shoot over their heads.

The agency which must be invoked to rescue the very poor, whether virtuous and struggling or degraded and indifferent, is the municipal power to destroy utterly unfit abodes of habitation. . . . (See TENEMENT PROBLEM.)

Intoxicating drink is the second great cause of pauperism, crime, and many other wretched conditions of degraded life. The temperance reform makes perceptible headway, altho the most powerful passions of mankind oppose its progress. . . .

My object here is to propose and stimulate an alliance of these two forces, the friends of temperance and all the other forces working to improve the conditions of the poor. Such an alliance will strengthen both and lead each party to see the broader scope of their task. (See TEMPERANCE.)

The third prolific cause of pauperism is found in the conditions of neglect or maltreatment of child-life in great cities. The Hon. A. S. Hewitt, in his address at the opening of the United Charities Building of New York (*Charities Review*, April, 1899, p. 304), says: "In this city a large number of children of both sexes live in an atmosphere of poverty and vice, and even crime, which educates them to be paupers and criminals instead of training them to become honest workmen and good citizens. And for this result, which is generally no fault of their own, they are punished, and, along with them, the industrious class of the community is also punished by taxation for the support of poorhouses, hospitals, and criminals. Gangs of young men, not yet twenty-one years of age, are to be found in many parts of the city who, not having been permitted to learn trades, or having been denied the opportunity to follow some useful occupation, have grown up in idleness, and expend their animal energies in excesses which make them a terror to the neighborhood and a trial to the police, the only barrier between them and crime. In time most of them necessarily become criminals, and they are very sure to breed criminals." (See DEPENDENT CHILDREN.)

Indiscriminate almsgiving is the fourth and a most potent cause of pauperism.

Three reforms of the abuses of outdoor relief should receive universal sanction, and will effect in very large measure the end which all parties desire: dealing with the unworthy, those out of work, and the inefficient.

First. To the unworthy, rigid prohibition of all relief, public or private, so that, abandoning all hope of it, they shall seek their own support. This includes the lazy, idle, shiftless, extravagant, or vicious paupers, as also in most cases those with relatives or friends.

Second. The provision for men or women out of work demands most serious study of ablest economists and statesmen. (See UNEMPLOYMENT.)

Third. The third and grand reform aims to recreate the inefficient, always in great cities a numerous class, into self-support by skill and cheer, and to save them from gratuitous relief as deadly poison. . . . One of the best standards to-day to test the progress of constructive Christian charity of the various towns and cities of our own or any country, is to see what practical measures have been devised to convert the inefficient into an efficient worker. (See INDUSTRIAL EDUCATION.)

More recently Mr. Edward T. Devine, general secretary of the New York Associated Charities and president of the National Conference of Charities and Correction, in his address before the conference, May, 1906, made the following significant statement:

If I have rightly conceived the dominant idea of the modern philanthropy it is embodied in a determination to seek out and to strike effectively at those organized forces of evil, at those particular causes of dependence and intolerable living conditions which are beyond the control of the individuals whom they injure and whom they too often destroy.

Other tasks for other ages. This be the glory of ours, that the social causes of dependence shall be destroyed. . . .

No doubt there are individual as well as social causes of dependence. No doubt the poor, like the rich, have their faults and weaknesses, the consequences of which recoil upon themselves. But since such faults and follies, such weaknesses and sins, are peculiar to no one class, since they are quite as abundant among those who give as among those who receive aid, may we not profitably turn to this other group of evils, evils from which the poor suffer grievously but against which they cannot effectively protect themselves?

I ask your attention to the common element in alcoholism as encouraged by the Liquor Trust; the cigarette evil as fostered by the Tobacco Trust; broken health and exhausted resources directly due to poisonous and fraudulent proprietary medicines; other injuries of a similar kind for which manufacturers and sellers of adulterated foods are responsible; the manufacture of sweated goods, with a sharing of the profit between dealer and consumer; the destruction of the health and the sacrifice of the lives of little children in cotton-factories, coal-mines, glass-factories, and tenement-house industries, for the sake of their employers' profits, altho in some instances also for their parents' greed; the sending of messenger boys of tender years to brothels and hotels, to their grave moral injury, that the difference between

**Edward
T. Devine**

their wages and the wages of men may go to swell the dividends of a great corporation; the abduction of innocent country girls at hotels and railway stations as a systematic industry, not merely to gratify the evil passions of individuals but also in order that the owners of houses in which prostitution is carried on may receive larger rents, and the renter more substantial profits; the payment of less than a living wage to girls in stores and factories, with sickening indifference to the methods by which the remainder is secured; the organized gambling schemes at race-track and in pool-room which hold their own in the empire state by open and shameless bribe to the county fairs; the erection and management of dwellings which are dark, unsanitary, and indecent, because they are among the gilt-edged investments yielding not 5 or 6 but 20 and 25 per cent on the capital risked by the speculative builder, but yielding also a goodly harvest of tuberculosis and other disease; yellow journalism avowedly pandering in the one class of journals to a feverish love for excitement, and in the other, usually sold at a higher price, to a morbid desire for salacious literature and suggestive advertisements, but both, as always, for pecuniary profit.

It is a long list, but it is by no means complete. Are not these, and other forces of a like kind, really responsible for the continual accession to the numbers of those who with their children come at last to require our help? And is there not a common element in all these agencies of the evil one, widely as they differ from one another and divergent as their origins and their natural history may seem to be? The love of money is their common root. And this root of these evils, and, as a higher authority has declared, of all evil, is not, at least so far as these evils are concerned, an abstraction, an impersonal devil. On the contrary, it is embodied capital appearing at legislative hearings, or quite as often in the legislature itself, pleading against reform the rights of property, the sacredness of vested interests, the burdensome cost of each measure for the public good, raising the dust of argument to conceal the heavy cost of inaction and neglect.

The plea is made in the name of the rights of property, in the name of legitimate business, but it is a false plea and no legitimate business stands upon so frail a foundation. There are broad-minded, warm-hearted, hard-headed business men to give the lie to the false plea of every branch of industry.

Commercial- ism the Cause of Much Poverty

The reason why there is need in our day as never before for organized, concerted action against these serried forces of evil, is that there is already organized aggressive action on the other side. It is the financial interest threatened in any reform which makes reform difficult or impossible. Housing reform might still be difficult even if there were not a strong pecuniary interest at stake in the building and renting of unreformed tenements. But it would be easier than it is. Child labor would come to an end in a twelve-month if there were not money to be made in the exploitation of child labor. The gigantic fraud of proprietary medicines would have been exposed and ended long since except for the advertising contracts and for that part of the \$100,000,000 annual sale which is illegitimate, for the cocaine manufacturers admit that at least 50 per cent of their output is illegitimately used. The Pure Food Bill would have passed the Senate ten years earlier at least if the interests which are involved in the manufacture and sale of impure or dishonestly named foods had not appeared year after year in opposition to the health boards and the reformers.

The Consumers' League would have more success in its efforts if the love of a bargain ingrained in the purchaser were not reinforced by the margin of profit which remains in sweat-shop products even after their price is fixed at a comparatively low level. The task of the temperance reformers would be enormously simplified if they had only to persuade the intemperate to mend their ways and to convince the young that abstinence is better for them than indulgence. I do not underestimate the difficulty of even this positive and necessary work. But what we now have to do in addition, and what we are thus far succeeding very indifferently in doing, is to fight and overcome a powerful organized financial interest, which is behind the saloon, and which is responsible, if there is such a thing as the moral law, for a very large proportion of the alcoholics in our hospitals for the insane, of the "drunk-and-disorderlies" in our jails and prisons, of the non-support cases with which our charitable societies deal, of the dependent children whose parents are finally adjudged to be unfit guardians.

I have yet to find the reform movement or the philanthropic undertaking which does not at some point or other see its efforts thwarted by some organized opposition which has its root in pecuniary profit—unholy, obviously illegal profit, or, it may be, quite as often outwardly respectable profit, sanctioned by law, and sharing, it may be, with church and philanthropy, but none the less at bottom antisocial, injurious to health or morals, worthy to be outlawed as soon as its evil nature is understood.

In this warfare against the active pernicious forces of evil in our modern communities the first need is for information. We are all culpably, incredibly ignorant of the very things which it would be most to our advantage and most to our

credit to know. I deliberately charge the temperance reformers in this conference, and there are not so many here as there should be, with complete ignorance as to the reasons for the existence of inebriates.

I charge the managers and officers of institutions for the care of children with ignorance of the causes which have led to the orphanage or the neglect of their wards. Are they on our hands because of essential vices and weaknesses of their parents, or because they were the victims of needless accidents, preventable disease, or industrial exploitation? I have yet to find the report of an asylum or reformatory that deals intelligently and fearlessly with these questions. And yet what questions more pertinent than these can be conceived?

I charge the hospitals—directors, superintendents, and physicians alike—with equal indifference or neglect. If things are taken down in the patients' statements on admission to be filed away in the office, if they are guessed at by wise physicians, or told to the nurses in the confidences of convalescence, which being blazoned abroad would furnish food for scandal, they are at least not tabulated and set forth in order by the hospitals so that we may shape legislation and social policies upon them. What we get instead is an appeal for funds to build and equip new wards, or at most a technical classification of diseases of which the economic and social significance is not at all understood.

Most of all I am constrained to charge my brethren in the charity organization movement itself, which stands preeminently for analysis of causes and thorough investigation, with not having at all appreciated the importance of the environmental causes of distress, with having fixt their attention far too much upon personal weaknesses and accidents and having too little sought for the evils which might yield to social treatment and for the antisocial action of other men for which our cases are paying the penalty.

We have long recognized that the process of pauperization requires a conjunction of moral weakness in the recipient with unwise aims on the part of the donor. Is it not time to recognize that practically all the other forms of degeneracy and dependence require at some stage or other a conjunction of some inherited or acquired weakness in the individual and an overt temptation or an unfavorable condition external to him which would ordinarily not be presented at all if it were not to the advantage, apparently, of another party to the transaction? The most profitable task of modern philanthropy is to find this other party and to deal by radical methods with him.

POVERTY IN THE UNITED STATES (see also article **POVERTY**): After studying with great care all the statistics and sources of information known to me upon the subject, I have come to the conclusion, as stated in my book on "Poverty," that there are no fewer than 10,000,000 persons in actual poverty in the United States. This does not mean that there is this number in distress; it does mean that at least this number is much of the time underfed, poorly clothed, and improperly housed. The estimate is conservative, and an inquiry, properly conducted, would very likely show a much larger number of persons in poverty.

I base this statement upon my own observation in various cities in this country, upon the figures of the U. S. Census for 1900 concerning unemployment, upon the reports of the State Boards of Charity, the *Bulletin of Statistics* Department of the city of Boston for 1903 the records of the Municipal Court of New York concerning the number of evictions, and the report of the Department of Corrections, concerning the number of pauper burials in New York City. The report of the New York State Board of Charities indicates that 29 per cent of

the people of New York in the year 1897, and 24 per cent in 1899, found it necessary to apply for relief. While these figures cover the relief given by many private organizations, they do not include a great deal of relief given by many small clubs, circles, churches, committees, and trade-unions. But, nevertheless, it is difficult to believe that such a large number of people in New York State were in actual distress.

Excluding half the number of persons relieved by the dispensaries, in order to make some arbitrary allowance for duplications, even then the number of persons relieved would indicate that the pauperism of New York State is enormous. In actual figures, as reduced, persons in distress in 1897 numbered 1,387,348, or about 19 per cent of the people of New York; and in 1899 they numbered 1,322,891, or about 18 per cent. Leaving out all dispensary aid, the number in distress for 1898 and 1899 is about 12 per cent of the population of the state. The Boston figures show that in the year 1903 over 136,000 persons, or about 20 per cent of the total population, were aided by the public authorities alone. Taking all of these figures, and making some allowance for duplications, the results would be as follows: 1897, 19 per cent of the people of New York State in distress; 1899, 18 per cent of the people of New York State in distress; 1903, 20 per cent of the people of Boston in distress; 1903, 14 per cent of the families in Manhattan evicted. Every year about 10 per cent of those who die in Manhattan have pauper burials. In addition to these facts, the United Hebrew Charities, in their report for 1901, declared that from 75,000 to 100,000 members of the New York Jewish community were unable to supply themselves with the immediate necessities of life, and for this reason were dependent in some way upon the public purse. The U. S. Census for 1900 would indicate that not fewer than 100,000 persons in New York were unemployed from four to six months during that year. On the basis of all these figures, a conservative estimate of the distress would be that 14 per cent of the people in the State of New York are in distress. Studies in a small town in Indiana made about twelve years ago indicate that a similar percentage were in distress there; a study made in Chicago four or five years ago led me almost to the same conclusion. These figures, however, indicate only the amount of distress, while the number of people in poverty would be very much greater. Those in poverty may not find it necessary to rely upon public assistance, but their manner of living is such as to prevent them from getting sufficient of necessities of life to enable them to maintain a state of physical efficiency.

My experience in Illinois, Indiana, and New York would lead me to believe that this could be fairly estimated at 20 per cent of the people, and applying this only to the largest industrial states, where it may be assumed the percentage of persons in distress is about the same as in the states inquired into, we may safely conclude that 6,600,000 persons in the states of New York, Massachusetts, Connecticut, New Jersey, Pennsylvania, Ohio, Illinois, Indiana, and Michigan are in poverty. Taking half of this percentage and applying it to other states, many of which have important industrial communities, as, for instance, Wisconsin, Colorado, California, Rhode Island, etc., and the conclusion is that not fewer

than 10,000,000 persons in the U. S. are in poverty. It is impossible in a short statement such as this to go into other estimates which would indicate a similar amount of poverty, and I am unable to state fully many reasons for believing that the percentages above used are conservative; but these figures, I believe, may be of use in conveying some idea as to the extent of poverty in the country. They are, of course, only estimates, and should not be used too positively or without certain reservations.

These additional facts are important: over 2,000,000 working men in the year 1900 were unemployed from four to six months during the year; about 500,000 male immigrants arrive yearly and seek work in the very districts where unemployment is greatest. Nearly half of the families in the country are propertyless; over 1,700,000 little children are forced to become wage-earners when they should still be in school; about 5,000,000 women find it necessary to work, and about 2,000,000 are employed in mills, factories, etc.; probably not fewer than 1,000,000 workers are injured or killed while doing their work; and about 10,000,000 of the persons now living will, if the present ratio is kept up, die of the preventable disease, tuberculosis.

It is to be regretted that our statistical data are too inadequate to permit us to be positive in our statements concerning the extent of poverty. It is to be hoped that these estimates may arouse the proper government officials to make careful inquiries into the facts. No one would be more pleased than I if they prove to be an overestimate, but all information which is now available leads me to believe that the extent of poverty is greater than this estimate would indicate.

ROBERT HUNTER.

POWDERLY, TERENCE VINCENT: Formerly General Master Workman of the Knights of Labor, now chief of Division of Information in Bureau of Immigration, Washington, D. C.; born, Carbon-dale, Pa., 1849; he attended common school six years; became a wage-earner at thirteen; was railroad switchman, car repairer, and brakeman. At seventeen he was apprenticed to the machinist trade, and became journeyman at twenty. In 1869 he removed to Scranton, Pa.; here he joined a branch of the Machinists' and Blacksmiths' International Union, soon becoming its president. He joined the Knights of Labor in 1874; held various offices in local and district assemblies; in 1879 was elected General Worthy Foreman, and the same year General Master Workman, which position he held for fourteen years, resigning in 1893 rather than serve with a board of officers whose policy he did not believe to be in harmony with the aims and objects of the order. He maintained that the education of the masses in all things—economic and political—stood paramount to the needs of a class. Against his protest, organization on trade lines was effected in the Knights of Labor. Conflicting elements struggled for the mastery within the order. He was charged with ordering strikes on and off for personal gain when in fact he never ordered a strike on or off, did not even receive the salary voted him, and was obliged to part with his home. Poor in pocket, rich in experience, he insisted upon his resignation being accepted. In 1878 he was elected Mayor of Scranton, on a Labor ticket, and served three terms of two years each, 1884 declining renomination. In 1888 he was

solicited to accept the Democratic nomination for Congress, but declined because he was not a Democrat or in favor of free trade. In 1891 he was nominated for delegate at large by the Republican State Convention of Pennsylvania and elected by the largest vote given any candidate on either ticket. In 1894 he was admitted to the bar of Lackawanna County, Pa., in 1897 to the bar of the Supreme Court of Pennsylvania, and in 1901 to the bar of the Supreme Court of the United States. In 1894 he identified himself with the Republican Party and stumped for General Hastings for governor. In 1896 he stumped several states for McKinley and Hobart. In 1897 he was appointed Commissioner-General of Immigration by President McKinley, serving until 1902. In 1900 he stumped several Western and Southern states for McKinley and Roosevelt. In 1906 he was appointed by Department of Commerce and Labor to inquire into causes of emigration from Europe, and in 1907 appointed Chief of Division of Information in Bureau of Immigration and Naturalization at Washington. Author: "Thirty Years of Labor"; "History of Labor Day"; "The Army of the Discontented"; numerous magazine articles. Address: 502 Quincy Street, N. W., Washington, D. C.

PRESBYTERIAN CHURCH AND SOCIAL REFORMS, THE: The Presbyterian Church is committed to the cause of social reforms, first of all, by the principles on which such reforms rest. They were first most clearly enunciated and sharply defined by John Calvin. Mr. Froude says of him:

There was no reformer in Europe so resolute to tear out and destroy what seemed to be false, and so resolute to establish what was true in its principles and make truth to its last fiber the rule of practical life. These characteristics of the stern leader were so wonderfully imprinted on his followers that they wrought for the good of man and from the highest motives. Mr. Froude says again: "The Calvinists abhorred as no other body of men has ever abhorred, mendacity, all impurity, all moral wrong of every kind as they could recognize it. What ever exists at this moment in England or Scotland of the fear of doing evil is the remnant of the convictions branded by the Calvinists into the people's hearts."

Green, in his "History of the English People," recognizes truly the genius of the new life of Europe and of the Reformation, when he says: "A vast and consecrated democracy, it stood in contrast with the whole social and political framework of the European nations. Grave as we count the faults of Calvinism, alien as its temper may be in many ways from the temper of the modern world, it is in Calvinism that the modern world strikes its roots, for it was Calvinism that first revealed the worth and dignity of man. Called of God and heir of heaven, the trader at his counter and the digger of the field suddenly rose into equality with the noble and the king."

The idea of the Reformation which is traceable to Calvin has often been regarded as largely theological in its character, and as dealing with speculative rather than practical truths. This is not true. The Reformation was not more of a theological than of a social and public reform. It was an endeavor to deliver people from their ignorance and sin, first by giving them right views of the truth and then adjusting their relations with one another. Consequently the main ideas distinctly traceable to Geneva and John Calvin have secured our modern civilization. Democratic government, free institutions, free

schools, and popular education—these are the great pillars on which our social reforms rest. The struggle for these constituted the great battles in Holland, France, England, and later in the United States. It required a revolution in all of these countries to establish these institutions, and our own revolution was nothing, as Bancroft has said, "but the application of the principles of the Reformation to our civil government." The history of the Presbyterian Church has been a history of the struggle for the rights of man. It was a body of Presbyterians who wrote the Mecklenberg Declaration—the pen stroke that in 1775 separated one county in North Carolina from the British Crown, and which first asserted the principle that Americans are, and of right ought to be, free and independent. Dr. John Witherspoon was not more eminent as a theologian than as a patriot. The synod of New York and Philadelphia was the first religious body to favor open resistance to England. Many of the Presbyterian ministers were actually engaged in civil service for their country. The blood of the Covenanter fought in the battles of the Revolution. The things at stake in these battles are the things at the bottom of all social reform. There is no progress of man without constitutional government, popular education, and deference to the rights of the people.

The Presbyterian Church, then, by reason of her principles, and of her history in illustrating and defending them, should be actively committed to every phase of social reform. Her protests against every evil have been constant and emphatic. Take, for example, the temperance reform; in this the Presbyterian Church has been unwavering in her testimony. Even as far back as 1854 the General Assembly took the following action:

Resolved, That the General Assembly continue to view with deep interest the progress of the temperance reformation, most intimately connected with the vital interests of men for time and eternity, and that they do especially hail its new phase through the action of several state legislatures, by which the tariff in intoxicating liquors as a beverage is entirely prohibited. They commend this new system of legislation to the attention and support of all ministers and churches connected with this body for its blessed results already experienced, and as able, if universally adopted, to do much to seal up the great fountains of drunkenness, pauperism, and crime, and relieve humanity of one of its most demoralizing and distressing evils.

The Presbyterian Church was the first of the denominations to officially establish a Department of Church and Labor, in connection with its Home Mission Board. This department was established in 1903. Its general object is to interpret the Church to working men, to interpret working men to the Church, and to interpret employer and employee to each other, through education, inspiration, mediation, evangelism, and Twentieth-century methods of Christian work.

Department of Church and Labor

It is the aim of the department to make it the best informed office in the world on the subjects which it is studying.

So that both the Church and labor may see each other with clearer vision, the plan of the exchange of fraternal delegates between ministers' associations and central labor-unions has been adopted. Working together, the ministers' association and the central labor-union are bringing about many municipal reforms. Indeed, united, there are few things in this direction which they

may not accomplish in the cause of good citizenship, independent of partizan politics. Especially in those matters which involve moral issues—such as the saloon, gambling, the social evil, Sunday work, child labor, sanitary conditions in tenement-houses and factories, and everything else that influences the moral life of the community—may these organizations cooperate. In operation in about one hundred cities, the plan is spreading from town to town, until it is hoped that it will become effective in the 600 cities of our country that support central labor unions and ministers' associations. The practical result of this plan has been that there is a more cordial relationship between working men and the Church, first, because the minister has a broader conception of what the labor movement stands for, and, second, because the labor leader has come to know something of the mission of the Church.

A press bureau furnishing over 300 labor papers of the United States and Canada with original articles which present the view-point of the Church with reference to the labor question, and discussing the workingman's relation to the Church, is part of the work of the department. In this way it has been speaking weekly to nearly three million trade-unionists and their families, thus making an audience of at least 10,000,000.

In 1905 the Presbyterian General Assembly passed the following resolution:

Appreciating the increasing importance of the industrial problem, and realizing that the labor question is fundamental to a moral and a religious question, and that it will never be settled upon any other basis, we recommend that the Presbyterian Home Mission committees appoint subcommittees for the purpose of making a systematic study of the entire problem in their respective localities. These committees shall cooperate with the newly organized Working Men's Department of the Board of Home Missions, thus establishing, in connection with the organized Presbyterianism of every city in America, a board of experts, who may be able to inform the churches with respect to the aims of organized labor, and to inform the working men concerning the mission of the Church. These committees shall also assist in the already successfully inaugurated plan of securing for the churches fraternal relationships with working men in their organizations; become responsible for the distribution of the literature issued by the board both for the membership of the Church and for the great mass of working men outside of the Church, and to push aggressively whatever methods may bring about a more cordial relationship between the Church and labor.

In accordance with this resolution the department has in practically every large city of the U. S. special committees which represent it in the study of local problems.

Conferences are also arranged for employers and employees for the discussion of industrial problems.

The pastors of the 11,000 Presbyterian churches in the U. S. are requested by the department each year to discuss some phase of the labor question on the Sunday preceding Labor Day. It believes that just as Memorial Day and the several "birthdays" show our appreciation of those who rendered patriotic service, and just as the Church's "holy days" do honor to those who have served mankind spiritually, so "Labor Sunday" should be observed by the churches in honor of the millions of toilers who daily serve mankind in the humbler places of life. This plan has the hearty indorsement of the leading central labor bodies of the country and of practically the entire labor press.

The following resolution, adopted by the American Federation of Labor, will indicate

how this movement has been received by the highest court of organized working men.

Whereas, The Presbyterian Church in the U. S. of America, at its last national convention, officially established a Department of Church and Labor for the express purpose of making a systematic study of the labor problem; and

Whereas, It is part of the plan of the department to appoint in every industrial center special committees that may become experts in their knowledge of every phase of the labor movement, so that they may inform the churches with respect to the aims of organized labor; therefore, be it

Resolved, That the American Federation of Labor, in convention assembled, indorse this new and significant movement in the Presbyterian Church, and we further recommend that central labor bodies cooperate with this department and with its subcommittees in every way that may be consistent, in order that the Church and the public at large may have a more intelligent conception of the conditions and aspirations of the toilers.

Resolved, That the American Federation of Labor recommends that all affiliated state and central bodies exchange fraternal delegates with the various state and city ministerial associations, wherever practicable, thus insuring a better understanding on the part of the Church and clergy of the aims and objects of the labor-union movement of America.

In the matter of the antislavery reform the Presbyterian Church encountered peculiar difficulty because she was strong in the slaveholding states and the antislavery agitation divided the Church. But at a time when other churches had taken no strong general action upon this subject—namely, as early as 1818—the General Assembly took the following action:

The General Assembly of the Presbyterian Church, having taken into consideration the subject of slavery, think proper to make known their sentiments upon it to the churches and people under their care. We consider the voluntary enslaving of one part of the human race by another as a gross violation of the most precious and sacred rights of human nature, as utterly inconsistent with the law of God, which requires us to love our neighbor as ourselves, and as totally irreconcilable with the spirit and principle of the gospel of Christ, which enjoins that "all whatsoever you would men should do unto you, do ye even so to them." Slavery creates a paradox in the moral system: it exhibits rational, accountable, and immortal beings in such circumstances as to scarcely leave them the power of moral action. It exhibits them as dependent on the will of others whether they shall receive religious instruction; whether they shall know and worship the true God; whether they shall enjoy the ordinances of the Gospel; whether they shall perform the duties and endearments of husbands and wives, parents and children, neighbors and friends; whether they shall preserve their chastity and purity or regard the dictates of justice and humanity. Such are some of the consequences of slavery—consequences not imaginary, but which connect themselves with its very existence. The evils to which the slave is ever exposed often take place in fact, and in their very worst degree and form; and where all of them do not take place—as we rejoice to say, in many instances, through the influence of the principles of humanity and religion on the minds of the masters, they do not—still, the slave is deprived of his natural right and degraded as a human being, and exposed to the danger of passing into the hands of a master who may inflict upon him all the hardships and injuries which inhumanity and avarice may suggest.

The Presbyterian Church has since been practically active in temperance reform. Its Temperance Committee is operating through five field secretaries, and three branch offices in as many leading cities. Its literature on this subject is extensive and it is widely distributed.

In the various lines of moral reform, both in society and in the State, the Presbyterian Church is probably doing her full share. She is striving to apply the highest power of her principles to the deepest needs of man. The ethical possibilities of Christianity are about to be proven as never before. And in this forward movement Presbyterian ministers and laymen have been, as they should be, conspicuous. They had been false to the historic glory of Presbyterians if they had not stood valiantly against every form of oppression and of unrighteousness.

CHARLES L. THOMPSON and CHARLES STELZLE.

PRESIDENCY: (In political science) the name given to the elective head of a republic. For the constitutional functions of the presidency in the United States, see CONSTITUTION. For the method of electing presidents in the U. S., see ELECTORAL COLLEGE. For the results of elections, see PRESIDENTIAL ELECTIONS. We consider in this article various conceptions of the presidency and criticisms and proposed reforms. The conception of the presidency in the U. S. Constitution is that the executive (the president with his cabinet) should be one of the three coordinate branches of the government. As a matter of fact a president of the U. S. is given great power—many think too much. In France and Switzerland his power is little more than nominal. The executive power in France is really held by the prime minister and his cabinet. France has been called a parliamentary republic. In Switzerland the president (see below) is simply the presiding member of the Federal Council, whose duty is to represent the Council. In the U. S. his power is anything but nominal. Professor James says that the President of the U. S. is not even really responsible to the people. He says ("Annals of the American Academy of Political and Social Science," May, 1896):

The term "responsible," in political science and in constitutional discussions, has come to have a definite technical meaning which makes it improper to use it in describing the relations of the officials in the U. S. to the people.

Looking for a moment at the president alone, there is no sense in which the term "responsible" is used in the discussions of political science in which the president can be fairly said to be responsible to the people at all. He is elected for a period of four years and during that period is as completely and absolutely out of the reach of law and legal process, in his official capacity as president, as even the crowned heads of Europe. It is true that if the president desires to be reelected, he may shape his policy with reference to the impression it will produce upon the voters of the country, or, at least, upon the politicians; but, so the German Emperor, if he desires to secure the passage of a bill through the German legislature, will act in such a way as, in his opinion, will contribute to that end, but he is not for that reason responsible, in any political sense, to the people. Even if the president might be said, in a certain sense, to be responsible in his first term—that is, so far as he may be affected by the desire to influence public sentiment in favor of securing a second term—certainly this cannot be said of his conduct during his second term with reference to a third. He knows full well that no conduct of his would be likely to secure a third term in the present temper and with the present political traditions of the people of the U. S.

No power is given to individual citizens, or to the citizens taken collectively, or to the states individually, or to the states taken together, to control or supervise in any way the acts of the president. He is, so far as any of these elements in our political system are concerned, absolutely irresponsible. Nor can he be reached by any process of the court, and he is, therefore, in this sense, as truly above the courts and free from responsibility to them as any king in Europe. Indeed one may say that in a certain sense the crowned heads of Europe are more immediately responsible to some power outside of themselves than is the president.

Of certain bond issues of Mr. Cleveland's administration, the *Detroit Tribune* said:

Until Cleveland proved by trial what a president could do, few persons, doubtless, were aware that money could be borrowed upon the public credit, for the payment of the ordinary expenses of the government, without consultation of the legislature of the people. It would appear incredible that an intelligent and watchful nation should let its government get into such shape as that the matter of public expenditure was not controlled by the parliamentary assembly. It was incredible until the object-lessons compelled belief. . . . By the existing law the executive is given a legal way of getting money without asking the people for it. If that is not a dangerous situation, it will be hard to find dangerous situations.

As to President Roosevelt, many, even of his own party, have felt that he has pushed the presidential power almost to the limits of national danger, showing, it is said, that under the con-

stitution a strong president can practically, if not formally, commit the country to treaties with foreign powers, involve the nation in war, employ the army, decide far-reaching policies, and take measures involving large expenditures of public moneys, almost of his own personal volition. Yet, in practise, these evils have not developed. Mr. James Bryce ("The American Commonwealth," 1st ed., chap. vii.) says:

Altho the president has been, not that independent good citizen whom the framers of the constitution contemplated, but, at least during the last sixty years, a party man, seldom much above the average in character or abilities, the office has attained the main objects for which it was created. Such mistakes as have been made in foreign policy, or in the conduct of the administrative departments, have been rarely owing to the constitution of the office or to the errors of its holder.

Nevertheless he tells us that this must not make us overlook certain defects incidental to the American presidency. He says:

In a country where there is no hereditary throne nor hereditary aristocracy, an office raised far above all other offices offers too great a stimulus to ambition. This glittering prize, always dangling before the eyes of prominent statesmen, has a power stronger than any dignity under a European crown to lure them (as it lured Clay and Webster) from the path of straightforward consistency. One who aims at the presidency—and all prominent politicians do aim at it—has the strongest possible motives to avoid making enemies. Now a great statesman ought to be prepared to make enemies. It is one thing to try to be popular—an unpopular man will be uninfluential—it is another to seek popularity by courting every section of your party. This is the temptation of presidential aspirants.

A second defect is that the presidential election, occurring once in four years, throws the country for several months into a state of turmoil, for which there may be no occasion. Perhaps there are no serious party issues to be decided, perhaps the best thing would be that the existing administration should pursue the even tenor of its way. The constitution, however, requires an election to be held, so the whole costly and complicated machinery of agitation is put in motion; and if issues do not exist, they have to be created. . . .

Again, these regularly recurring elections produce a discontinuity of policy. Even when the new president belongs to the same party as his predecessor, he usually nominates a new cabinet, having to reward his special supporters. . . .

Fourthly. The fact that he is reelectable once, but (practically) only once, operates unfavorably on the president.

Defects

He is tempted to play for a re-nomination by so pandering to active sections of his own party, or so using his patronage to conciliate influential politicians, as to make them put him forward at the next election. On the other hand, if he is in his second term of office, he has no longer much motive to regard the interests of the nation, because he sees that his own political death is near. . . .

Fifthly. An outgoing president is a weak president. During the four months of his stay in office after his successor has been chosen, he declines, except in cases of extreme necessity, to take any new departure, to embark on any executive policy which cannot be completed before he quits office. This is, of course, even more decidedly the case if his successor belongs to the opposite party.

Lastly. The result of an election may be doubtful, not from equality of votes, for this is provided against, but from a dispute as to the validity of votes given in or reported from the states. This difficulty arose between Mr. Hayes and Mr. Tilden, disclosing the existence of a set of cases for which the constitution had not provided. It will not recur in quite the same form, for provision has now been made by statute for dealing with disputed returns. But cases may arise in which the returns from a state of its electoral votes will, because notoriously obtained by fraud or force, fail to be recognised as valid by the party whose candidate they prejudice. No presidential election passes without charges of this kind, and these charges are not always unfounded. Should manifest unfairness coincide with popular excitement over a really important issue, the self-control of the people, which in 1877, when no such issue was involved, restrained the party passions of their leaders, may prove unequal to the strain of such a crisis.

Another evil which Mr. Bryce refers to in another chapter has been recently much minimized by civil service reform (q. v.), but is yet a very great one perhaps to some extent a necessary evil—the presidential appointing power.

It is probably necessary that a president responsible to an extent for the whole federal administration should appoint his own cabinet and heads of departments, subject to the approval of the Senate, as required by the constitution; but it is not necessary that these offices should be looked upon as

the natural rewards for party service, and that from the day of his election till long after his inauguration the time of a president should be almost wholly occupied by considering rival claims for office. Yet this is the almost inevitable result under the present constitution, which gives the president so much power. Says Mr. Bryce (idem, chap. vi.):

"Artemus Ward's description of Abraham Lincoln swept along from room to room in the White House by a rising tide of office-seekers is hardly an exaggeration. From the 4th of March, when Mr. Garfield came into power, till he was shot in the July following, he was engaged almost incessantly in questions of patronage. Yet the president's individual judgment has little scope. He must reckon with the Senate; he must requite the supporters of the men to whom he owes his election; he must so distribute places all over the country as to keep the local wire-pullers in good humor, and generally strengthen the party by 'doing something' for those who have worked or will work for it. Altho the minor posts are practically left to the nomination of the senators or congressmen from the state or district, conflicting claims give infinite trouble, and the more lucrative offices are numerous enough to make the task of selection laborious as well as thankless and disagreeable. . . . No one has more to gain from a thorough scheme of civil service reform than the president. The present system makes a wire-puller of him. It throws work on him unworthy of a fine intellect, and for which a man of fine intellect may be ill-qualified. On the other hand the president's patronage is, in the hands of a skilful intriguer, an engine of far-spreading potency. By it he can oblige a vast number of persons, can bind their interests to his own, can fill important places with the men of his choice. Such authority as he has over the party in Congress, and therefore over the course of legislation; such influence as he exerts on his party in the several states, and therefore over the selection of candidates for Congress, is due to his patronage. Unhappily, the more his patronage is used for these purposes, the more it is apt to be diverted from the aim of providing the country with the best officials."

Appointing Evil

on the party by 'doing something' for those who have worked or will work for it. Altho the minor posts are practically left to the nomination of the senators or congressmen from the state or district, conflicting claims give infinite trouble, and the more lucrative offices are numerous enough to make the task of selection laborious as well as thankless and disagreeable. . . . No one has more to gain from a thorough scheme of civil service reform than the president. The present system makes a wire-puller of him. It throws work on him unworthy of a fine intellect, and for which a man of fine intellect may be ill-qualified. On the other hand the president's patronage is, in the hands of a skilful intriguer, an engine of far-spreading potency. By it he can oblige a vast number of persons, can bind their interests to his own, can fill important places with the men of his choice. Such authority as he has over the party in Congress, and therefore over the course of legislation; such influence as he exerts on his party in the several states, and therefore over the selection of candidates for Congress, is due to his patronage. Unhappily, the more his patronage is used for these purposes, the more it is apt to be diverted from the aim of providing the country with the best officials."

Very many also criticize the methods of electing the president in the U. S. (See ELECTORAL COLLEGE.) In France the president is elected by the two houses of the legislature sitting together as a "National Assembly." In the Swiss republic the executive power is not lodged with one man, but in a federal council (Bundesrath), elected for a term of three years by an assembly of the two houses of legislature sitting together. This assembly also elects the president and vice-president of the Bundesrath, but the president is given little more power than his colleagues, and can only serve one term. Rotation in the office is rigidly carried out. In Brazil, Peru, and Bolivia the president is elected by direct vote of the people. In Mexico, Chile, and the Argentine Republic it is by indirect vote.

As to reforms affecting the presidency, discussions in the U. S. have turned mainly upon the method of electing presidents, their length of term, and their appointing power.

Concerning the method of electing presidents it is proposed that the president be elected by direct vote of the people. This would give every man a chance to express his wish, not compelling him to vote for nominees of a party. It is claimed that it would put the president in closer touch with the people, and make him more independent of party machines; that it would lessen the opportunity for corruption. On the other hand it is argued that, as there would have to be concert of action to elect a candidate, there would be practically no more freedom of personal choice than now, while secret and corrupt concerted action would have more chance. As to the objection that the present electoral system often elects a candidate who has not received the popular majority, it is answered that a popular majority might often be a sectional majority and not represent the whole country any more truly. It is, therefore, secondly, suggested that the president be elected by the national legislature, as in France.

Very many favor lengthening the term of office from four to six years, making the elections less frequent, and then forbidding a second term.

Mr. George T. Curtis (*Century*, vol. vii., p. 124) proposed having the Electoral Commission meet as an electoral chamber, competent to judge of the qualifications and returns of its own members, and then allowing this body to elect the president as responsible men, not as the mere automata of parties.

Mr. Albert Stickney ("A True Republic," chap. ix.) would make changes in the power to be given the office, and make the president responsible to the legislature, who should have direct power of removing him, without a hearing, if they think public interests demand it, by a two-thirds vote of both houses sitting as one body. He asks if any one ever heard of such a thing as insuring efficient work from a man who could not be removed instantly, so soon as, for any reason, he failed to do his work well. He would give the president the sole appointing and removing power for all heads of departments and no more. Each department head should be solely responsible for his department, each subordinate head being responsible for those under him; the president, finally, being responsible to the legislature. This system would take from the chief executive any voice in the appointment or removal of the great number of subordinate officials which he now has. It would free him to appoint his department heads without a two-thirds vote of the Senate. For any misconduct or failure he could himself be removed. If not removed, he could hold the office for life.

Some radicals believe in the abolition of the presidency. Says a memorial address to Congress:

1. The presidency is a copy of royalty: it is an essentially unrepresentative institution; for it exalts an individual into ruling power over all the rest of the population, bringing them into a relation of subjection toward him, and accustoming them to monarchical ideas.

2. It is thoroughly antidemocratic in nature; for it does not only ignore the direct authority of the popular will, but opposes an independent and autocratic front to the representative thereof—the legislature.

3. It maintains the false, illogical, disorganizing theory—born in monarchy, and principally denying democracy—of the "partition of powers." In the democratic polity, all powers are derived from the people, and are no more capable of partition from and against each other than are the people.

4. It is a constantly menacing, constantly growing cause of danger to the republic—whose eventual ruin it must inevitably occasion.

5. If it do not cause such ruin by direct, violent subversion, it must effect the same through corruption; for the presidential office is the source, the constantly growing source, of universal corruption.

To avoid these dangers, the undersigned suggest that Congress propose an amendment to the constitution, abolishing the presidency, and transferring the executive functions to an administrative commission or congressional ministry, to be chosen by Congress from their own body, or from among other competent citizens; and to be supervised and instructed during the adjournment of Congress by a standing committee, who are to be in permanent session during that time, and who are to be authorized to call extra sessions of Congress when needed.

PRESIDENTIAL ELECTIONS: The following tables of the results of presidential elections are from the *World Almanac* of 1907.

There is, properly speaking, no popular vote for president and vice-president; the people vote for electors, and those chosen in each state meet

therein and vote for the candidates for president and vice-president. The record of any popular vote for electors prior to 1824 is so meager and imperfect that a compilation would be useless. In most of the states, for more than a quarter century following the establishment of the government, the state legislatures "appointed" the presidential electors, and the people therefore voted only indirectly for them, their choice being expressed by their votes for members of the legislature. In this tabulation only the aggregate electoral votes for candidates for president and vice-president in the first nine quadrennial elections appear.

ELECTORAL VOTES

1789. Previous to 1804, each elector voted for two candidates for president. The one who received the largest number of votes was declared president, and the one who received the next largest number of votes was declared vice-president. The electoral votes for the first President of the United States were: George Washington, 69; John Adams, of Massachusetts, 34; John Jay, of New York, 9; R. H. Harrison, of Maryland, 6; John Rutledge, of South Carolina, 6; John Hancock, of Massachusetts, 4; George Clinton, of New York, 3; Samuel Huntington, of Connecticut, 2; John Milton, of Georgia, 2; James Armstrong, of Georgia; Benjamin Lincoln, of Massachusetts, and Edward Telfair, of Georgia, 1 vote each. Vacancies (votes not cast), 4. George Washington was chosen president and John Adams vice-president.

1792. George Washington, Federalist, received 235 votes; John Adams, Federalist, 77; George Clinton, of New York, Republican, 50; Thomas Jefferson, of Virginia, Republican, 4; Aaron Burr, of New York, Republican, 1 vote. Vacancies, 3. George Washington was chosen president and John Adams vice-president.

1796. John Adams, Federalist, 71; Thomas Jefferson, Republican, 68; Thomas Pinckney, of South Carolina, Federalist, 59; Aaron Burr, of New York, Republican, 30; Samuel Adams, of Massachusetts, Republican, 15; Oliver Ellsworth, of Connecticut, Independent, 11; George Clinton, of New York, Republican, 7; John Jay, of New York, Federalist, 5; James Iredell, of North Carolina, Federalist, 3; George Washington,

of Virginia, John Henry, of Maryland, and S. Johnson, of North Carolina, all Federalists, 2 votes each; Charles Cotesworth Pinckney, of South Carolina, Federalist, 1 vote. John Adams was chosen president and Thomas Jefferson vice-president.

1800. Thomas Jefferson, Republican, 73; Aaron Burr, Republican, 73; John Adams, Federalist, 65; Charles C. Pinckney, Federalist, 64; John Jay, Federalist, 1 vote. There being a tie vote for Jefferson and Burr the choice devolved upon the House of Representatives. Jefferson received the votes of ten states, which, being the largest vote cast for a candidate, elected him president. Burr received the votes of four states, which, being the next largest vote, elected him vice-president. There were two blank votes.

1804. The Constitution of the U. S. having been amended, the electors at this election voted for a president and a vice-president, instead of for two candidates for president. The result was as follows: For president, Thomas Jefferson, Republican, 162; Charles C. Pinckney, Federalist, 14. For vice-president, George Clinton, Republican, 162; Rufus King, of New York, Federalist, 14. Jefferson was chosen president and Clinton vice-president.

1808. For president, James Madison, of Virginia, Republican, 122; Charles C. Pinckney, of South Carolina, Federalist, 47; George Clinton, of New York, Republican, 6. For vice-president, George Clinton, Republican, 113; Rufus King, of New York, Federalist, 47; John Langdon, of New Hampshire, 9; James Madison, 3; James Monroe, 3. Vacancy, 1. Madison was chosen president and Clinton vice-president.

1812. For president, James Madison, Republican, 156; De Witt Clinton, of New York, Federalist, 89. For vice-president, Elbridge Gerry, of Massachusetts, 131; Jared Ingersoll, of Pennsylvania, Federalist, 86. Vacancy, 1. Madison was chosen president and Gerry vice-president.

1816. For president, James Monroe, of Virginia, Republican, 183; Rufus King, of New York, Federalist, 34. For vice-president, Daniel D. Tompkins, of New York, Republican, 183; John Eager Howard, of Maryland, Federalist, 22; James Ross, of Pennsylvania, 5; John Marshall, of Virginia, 4; Robert G. Harper, of Maryland, 2. Vacancies, 4. Monroe was chosen president and Tompkins vice-president.

1820. For president, James Monroe, of Virginia, Republican, 231; John Q. Adams, of Massachusetts, Republican, 1. For vice-president, Daniel D. Tompkins, Republican, 118; Richard Stockton, of New Jersey, 8; Daniel Rodney, of Delaware, 4; Robert G. Harper, of Maryland, and Richard Rush, of Pennsylvania, 1 vote each. Vacancies, 3. James Monroe was chosen president and Daniel D. Tompkins vice-president.

* The candidates starred were elected. ¹ The first Republican Party is claimed by the present Democratic Party as its progenitor. ² No candidate having a majority of the electoral vote, the House of Representatives elected Adams. ³ Candidate of the Anti-Masonic Party. ⁴ There being no choice, the Senate elected Johnson. ⁵ Eleven Southern States, being within the belligerent territory, did not vote. ⁶ Three Southern states disfranchised. ⁷ Horace Greeley died after election, and Democratic electors scattered their votes. ⁸ There being a dispute over the electoral vote of Florida, Louisiana, Oregon, and South Carolina, they were referred by Congress to an electoral commission composed of eight Republicans and seven Democrats, which, by a strict party vote, awarded 185 electoral votes to Hayes and 184 to Tilden. ⁹ Free Democrats. ¹⁰ Free Silver Prohibition Party. ¹¹ In Massachusetts. There was also a Native American ticket in that state which received 184 votes.

¹² Middle of the Road or Anti-Fusion People's Party. ¹³ United Christian Party. ¹⁴ Union Reform Party.
For popular and electoral vote by states in 1900 and 1904 see following tables.

PREVENTION OF CRUELTY TO CHILDREN, THE NATIONAL SOCIETY FOR THE: Established in London in May, 1884, and became incorporated by royal charter as a national society. Patrons, the king and queen, and a long list of notables. President, the Duke of Abercorn. Object: that no child in the United Kingdom shall live an unendurable life. This object is sought by (1) warnings; (2) enforcement of laws; (3) promotion of any new law that may be necessary. We quote from an earlier report of the director:

If the reader will conceive of a procession of 1,179,916 children passing before him, child after child, he may gain some adequate sense of the wrong and the suffering the society has been working among since it began in 1889. First come 943,910 sufferers from neglect and starvation, miserable with living irritations and filth, ragged, well-nigh naked. Following these come 128,252 children who suffered violence from all sorts of weapons in the hands of the reckless, vengeful ones who owned them. . . . Then come 69,621 little things who were exposed to suffering to draw the lazy and cruel charity of the street for the benefit of their elders. . . . After these 24,527 pitiable girl victims of immorality. . . . And then 18,167 little slaves of improper, hurtful, and dangerous employments . . . toilers with burdens too heavy, and

sufferers by various other cruel wrongs. . . . And last of all come 4,561 funerals of little ones, where the society obtained its information of their childish wrongs too late to save them, and had therefore nothing that it could do save to bring the cruel parents to their appropriate punishment at the hands of justice. The procession is 558 miles long and takes nine days to accomplish its painful 'march past.'

There is one third of the kingdom where its agencies are not yet established. Organ, *The Child's Guardian*. The League of Pity is the children's section of the society. Its object is to interest happy children in the welfare of the unhappy, and to do as much for the latter as possible. Director, R. J. Parr, Leicester Square, London.

PRICE, HON. THOMAS: Premier, Commissioner of Public Works, and Minister of Education of South Australia since July, 1905; previously leader of the Parliamentary Labor Party from 1901; born 1852. Clerk of works in the government employ at Islington locomotive shops; worked at his trade as stone-cutter on Parliament buildings. He has sat in House of Assembly since

1893. Secretary of Masons and Bricklayers' Society in 1891 and Labor Party in 1901. Prominent temperance leader. Address: Hawthorne, Lower Mitcham, near Adelaide, South Australia.

PRICES: The following table as to the prices of the leading classes of necessary articles of daily consumption at primary markets is from the United States Statistical Abstract for 1907:

The course of prices of commodities is shown and in each case the price is multiplied by the annual per capita consumption, which precludes any one commodity having more than its proper weight in the aggregate. Breadstuffs include many quotations of wheat, corn, oats, rye, barley, beans, and pease; meats include live hogs, beef, sheep, and many provisions, lard, tallow, etc.; dairy and garden products embrace eggs, vegetables, fruits, milk, butter, cheese, etc.; other

food includes fish, liquors, condiments, sugar, rice, tobacco, etc.; clothing covers the raw material of each industry, and many quotations of woolen, cotton, silk, and rubber goods, as well as hides, leather, boots, and shoes; metals include various quotations of pig iron and partially manufactured and finished products, as well as the minor metals, tin, lead, copper, etc., and coal and petroleum; miscellaneous includes many grades

of hard and soft lumber, laths, brick, lime, glass, turpentine, hemp, linseed oil, paints, fertilizers, and drugs. The third decimal is given for accuracy of comparison.

GREAT BRITAIN

Basing his conclusions on the "Report on Wholesale and Retail Prices of the Board of Trade for 1903," Mr. A. L. Bowley ("National

Progress and Wealth and Trade," p. 25) comes to the following conclusions:

If we make up a budget of the goods most usually purchased by the working classes, and compare the prices at which they were bought year by year for the last twenty years, we find that such a budget, costing £1 in the period 1898-1902, would have cost 19s. 6d. in 1893-95, 20s. 6d. in 1888-92, and 21s. 6d. in 1883-87. In other words, during the last twenty years the purchasing power of money has increased about 8 per cent, or (what is the same thing) prices have fallen about 8 per cent. Thus, while the apparent increase of wages

Fall in Prices

HOME PRODUCTION

Trade," pp. 35-42) gives the following table and statements. He says:

There are unfortunately very few cases where we have any direct information as to total production; and the indirect evidence given by the use of raw materials does not enable us to distinguish the output for the home from that for the foreign market. The table below gives the accessible information as to such production.

Of so-called raw materials, the output of coal and pig iron has increased considerably, that of other metals fallen fast. Among agricultural produce wheat has fallen; and other cereals, hay, and roots have fluctuated year by year without any permanent change of level. The quantity of fish landed

¹ Produced from British or foreign ores.

² Average for 1884-87.

³ Average for 1885-87.

⁴ Excluding ships built for the Royal Navy.

was about 30 per cent in that period, the real increase, when we allow for the fall in price, is found to be about 40 per cent.

In the above estimates are included the prices of bread (fall 10 per cent), meat (fall 10 to 20 per cent), sugar (fall 30 per cent), tea (fall 20 per cent), oil (fall 30 per cent), coal (rise 30 to 30 per cent), beer and tobacco (unchanged), and some clothing materials: in all over forty articles.

There are omitted, on the one hand, the innumerable small and rapidly cheapening articles of modern manufacture (e. g., cheap household requisites), and furniture, bicycles, traveling, newspapers, and other miscellaneous goods, which account for a considerable part of the normal expenses of those households where the income is above the bare minimum: in this group the fall of price must have been considerable. On the other hand is omitted rent (including rates), which is generally supposed to have risen in towns. . . .

Taking all these things into consideration, it may be reasonably admitted that the value of £1 in the hands of a workman has at any rate not fallen in the last twenty years; while the evidence on the whole is in favor of the rise of nearly 10 per cent.

Of other countries Mr. Bowley says (*idem*, p. 78):

No reliable comparison can as yet be made with former years, though data are accumulating. In 1902 wheat was about the same price in the United Kingdom, the United States, and Belgium, dearer in Germany, and yet dearer in France. Beef is stated to have been about the same price in England, France, and Germany, and cheaper in Belgium and at New York. For sugar England was much the cheapest and France the dearest of these countries.

The figures we have for Germany ("Fiscal Blue Book," pp. 223-226) show that the course of prices in the last fifteen years has been similar there and in England. A comparison with twenty years ago shows a greater fall in England than in Germany. The German figures come from Essen only. The figures given on p. 227 (*ibid.*) are of wholesale prices, and show great fluctuations.

Concerning production in the United Kingdom A. C. Bowley ("National Progress in Wealth and

on our shores has increased steadily. The tonnage of ships built for the home mercantile navy or for foreigners was 23 per cent more in the years 1893-1902 than in the previous decade.

The conveyance of goods to their destination or to the sea is an essential part of their production, and therefore the weight handled by railways is given in the table.

It is obvious that no general conclusions can be drawn from such incomplete statistics. Practically the only industries of which we know the output are mining, agriculture, and shipping. The only means, then, that we have at present of judging our productive power is by the consumption of raw materials. . . .

When we compare the years 1898-1902 with 1883-87, we find that we have used in manufacture 15 per cent more cotton, 40 per cent more wool, 18 per cent more iron, 60 per cent more lead, 80 per cent more zinc, 85 per cent more leather, 60 per cent more imported wood and timber, 88 per cent more coal, the same amount of tin, but 25 per cent less silk, in the latter period than in the former; meanwhile the population has grown 14 per cent.

To obtain these figures the home production and foreign importations of the raw materials have been added together, the exportation subtracted, and the remainder taken as used at home. There is some doubt about the exact amount of tin, lead, and zinc retained, and we have no figures for home-grown timber nor sufficient figures for flax or jute, while those for copper need expert interpretation.

This list includes the great bulk of the more important raw materials, and shows a very remarkable progress.

PRIMARIES (for the evils of the present system of primaries existing in most states of the United States, see ELECTIONS, p. 439): The flagrant abuses which have arisen in the U. S. from primaries early led to discussions of methods of reform, but only within the last ten or twelve years has there been progress actually made. The first reform undertaken was the so-called

"primary election laws," embodying in various ways the control of primaries by law, by making the primary meeting of a political party a legally organized body instead of a self-constituted group. Massachusetts, New York, New Jersey, Pennsylvania, Illinois, Ohio, Michigan, Maryland, South Carolina, Georgia, and other states have adopted statutes of this nature. While details vary, in general it may be said that they provide that due public notice be given of the time and place of primary elections; that the elections be by ballot, and that the expense be paid by the state. In some states the law defines the qualification for admission to the primary. In general the aim is to give all persons who voted with their party at the last elections the right to a vote in the choice of candidates in the primary.

Besides variation in details, there has also been in most states progressive legislation. In Illinois, for example, two systems have been tried:

(1) The indirect or convention system, wherein the law gives to the parties a method which simply insured that the delegates to the nominating convention were honestly elected and seated.

(2) The direct system, wherein the law furnished parties a method whereby the members of a party should vote directly on various names to determine the nominee of the party.

The general tendency is, however, first, to increase the control of primaries by state law and then, secondly, to abolish them and substitute "*direct nominations*" (q. v.) as in the Minnesota Primary Law.

According to this plan in place of a primary there is held a preliminary election conducted by the state in which a voter may participate. Each voter indicates the name he nominates, and the party for which he nominates him. Prospective candidates may announce their names to the public before the preliminary election in any way or through any organization they will. The election gives the official nomination in each party to the person receiving the largest support.

This is in many ways like the second ballot in France. (See ELECTIONS, p. 440.)

This system was first tried in Minneapolis in 1899 and later was applied to state elections. It is said to be a distinct success and this idea is being largely advocated in other states. At the Congress of Primary and Election Laws, held by the National Civic Federation, April, 1906, Mr. Horace E. Deming (of New York), of the National Municipal League, thus outlined a general system of primary reform:

The nominating election should be a public election to determine as to each elective public officer who, as a candidate for that office, shall have the right as the sole representative of a given set of political principles properly applicable to its conduct to have his name appear upon the official ballot used at the general election. Prior to registration day, let every candidate for nomination be announced as such candidate, together with a statement of the platform of political principles upon which he stands, each distinct set of principles being denoted by a short title or phrase; let the names of all candidates for the nomination be printed by the state upon an official nominating ballot delivered to the voter upon a registration day and immediately after registering, and let the voter mark secretly upon it his preference among all the candidates for nomination to each office; let the ballot then be deposited in the ballot-box under exactly the same circumstances as at the general election, and at the close of the polls let the votes be canvassed and the result be announced, as at the general election; upon the official ballot used at the ensuing general election, let only such policies and candidates appear as have successfully passed the two tests set forth above. In this way the local interests of the city could be freed from confusion with national politics;

and municipal elections could be fought out by local parties, which would appear and disappear according as local issues did or did not warrant their existence.

The incongruity and absurdity of having so many elective offices would be brought out clearly, and the day would be hastened when the nine out of ten offices now elective which should be appointive would be taken out of politics.

PRIMITIVE PROPERTY: According to some sociological writers, the present system of private ownership in land was preceded by a system of collective or communal ownership and cultivation. The main authorities for this view are Sir Henry Maine, in his "Ancient Law"; G. L. von Maurer, in his "Einleitung zur Geschichte der Mark, Hof-, Dorf- und Stadtverfassung" (1854); P. Viollet, in his "Bibliothèque de l'École des Chartes" (1872), and Em. Laveleye, in his "De la Propriété de ses Formes Primitives" (1874), well known to English readers in Marriott's translation, "Primitive Property" (1878). Maine says in the above work (p. 268):

Property once belonged not to individuals, nor even to isolated families, but to larger societies. Maurer says (p. 93): "All land in the beginning was common land and belonged to all; that is to say, to the people." Viollet says (p. 503): "Land was held in common before it became private property in the hands of a family or an individual." De Laveleye says: "The arable land was cultivated in common; private property grew up afterward out of this ancient common ownership."

Maurer builds his argument from certain expressions in Caesar, Tacitus, and other Latin authors, and from certain words and phrases like *communio* and *ager publicus* in classic and medieval formularies, laws, etc. He studies the subject simply in regard to Germanic peoples.

Viollet finds communal property described or referred to among the Greeks and Romans, by Plato, Vergil, Justin, Tibullus, and other writers. He sees a relic of it in the public meals of Sparta, the feasts of the Athenian *prytanes*, and of the Roman *curia*.

De Laveleye traces such communal property in the Javan *dessa*, the Russian *mir*, the Indian village community, the German *Mark*, the family communities of Bosnia, Servia, Bulgaria, Champagne, and Auvergne, in the Swiss *Allmendes*, the Scotch township, the common lands of France, Belgium, and other countries. De Laveleye does not write as an admirer of the "primitive communism." He argues, in his introduction, that inequality overthrew Greece and Rome and threatens us in still more critical form, and then says: "The object of this book is not to advocate a return to the primitive agrarian community, but to establish historically the natural right of property as claimed by philosophers, as well as to show that ownership has assumed various forms and is consequently susceptible of progressive reform." According to De Laveleye, land was first unappropriated at all. Then certain tribes laid claim to certain portions of territory for grazing purposes. Next, portions began to be claimed for cultivation by the tribe. Then this was parceled out among the families of the tribe for cultivation.

Next the parcels were claimed for occupation by patriarchal families. Finally, individual hereditary property appears. For a discussion of the Russian *mir*, see *MIR*; for the German *Mark*, see *MARK*; for the *Allmend*, see *SWITZERLAND*. Of the Slavic family communities De Laveleye gives a specially interesting account. Under this system land belongs to the *gmina* (German *Gemeinde*, or commune), which divides the land among the patriarchal families, according to their size. At the head of each family is a *gospodar*. He is elected by the community and transacts its business. He is the executive, but acts only with the advice of the community. The wife of the *gospodar* or some other chosen woman is the *domachica*, and regulates the domestic interests. The houses cluster around the central house of the *gospodar*. In this house all take their meals. Each community has twenty to thirty persons, and occasionally more. There are usually three generations. When the community becomes too large it divides. The young women usually pass into their husbands' family community. The fruits of the agricultural labor are usually held in common, but of industrial labor, individually. Each community owns about forty acres. The aged and infirm are cared for in common. The women take turns in the common work. Communities aid each other. In the evenings, the community meets for songs and dance. Members are allowed to leave. The system allows of division of labor, union of capital and labor, and simple fraternal life. But it is dying before the forces of self-seeking and western individualism.

Similar communities, De Laveleye says, were developed all through Europe in the Middle Ages, and existed till our own day in Brittany, Auvergne, and various secluded territories.

This view of primitive property in land, however, has been severely criticized by other scholars; notably by Fustel de Coulanges in an essay on "The Origin of Property in Land," first appearing in the *Revue des Questions Historiques* for April, 1889, and translated under the above title by Margaret Ashley (1891).

M. de Coulanges argues that Maurer and Viollet have forced the meaning of the classic authors they quote, and that common meals and family communities by no means prove the communal ownership of land. De Coulanges says in summing up his essay (p. 149): "Are we to conclude from all that has gone before that nowhere and at no time was land held in common? By no means. To commit ourselves to so absolute a negative would be to go beyond the purpose of this work. The only conclusion to which we are brought by this prolonged examination of authors, is that community in land has not yet been historically proved. . . . M. Viollet has not brought forward a single piece of evidence which proves that the great cities ever practised agrarian communism. M. de Jubainville has not brought forward one which proves communism in Gaul. Maurer and Lamprecht have not produced one which shows that the *Mark* was common land. . . . National communism has been confused with the common ownership of the family; tenure in common has been confused with ownership in common; agrarian communism with village commons."

Contrary View

Such are the two opposing schools. Some argue that the correct balance of truth is that property was not originally held either by individuals or communally, but by bodies of men under some "strong man"—despot, tyrant, or at best patriarch. This would be far from communism, but perhaps equally far from individual ownership.

Prof. Ch. Letourneau in his "Property and Its Origin and Development" (Contemporary Science Series, 1892) finds the origin of property in a biological root, which begins among the animals.

The instinct of property, he says (p. 9), is but one of the manifestations of the most primordial of needs—the need of self-preservation of existing, and securing existence to offspring. The banquet of existence is very irregular and sometimes very niggardly; the guests are numerous, hungry, and often brutal. Yet, under pain of death, a place must be gained there, defended, and, as far as possible, retained; for continually recurring needs must constantly be satisfied. The severity of the struggle for existence may be greater or less, but it goes on without a truce; therefore the more intelligent the organized being, whether man or animal, the more he takes thought for the future, the more he tries, by securing some sort of property, to reduce the element of chance in his life. . . . But this may be done in various ways: sometimes selfishly, in isolation, if the individual is gifted enough or well enough armed with force or cunning to suffice unto himself; sometimes collectively, if those concerned are sufficiently intelligent, sufficiently sociable, to supplement their native feebleness by combining, by creating a powerful cluster through the union of small individual energies. These two very different methods of understanding property are found in the animal kingdom, and each of them makes its own mark upon the manners, tendencies, and mentality of the species. Letourneau then goes on to trace the development of the instinct of property in the animals which lay claim to certain tracts of territory, exactly as do nomadic tribes, or to dens, lairs, or nests, exactly like primitive men. Weaker animals, like bees and ants, have to think of the future. They develop sociability and intelligence, and organize armies and clusters, with officers and laws. From the animal, Letourneau passes to man and finds some men lower than the brute in the instinct of property. He notices the property of anarchic hordes, the savages of Borneo, the Vedda of Ceylon, the sociability of the Bushmen, the solidarity of the Fuegians, the Australian clans. Among them all property is, as a rule, communal and not private, though the instinct of private property is developing in the private ownership of a weapon or an ornament. Often these are burned or buried with the dead owner. For the property in women, see FAMILY. Among the republican tribes of America, Letourneau finds the same, from the communism of the North American Indian to the developed kingdom of the Incas (see PERU). A step up we come to the monarchic tribes, where despotic heads develop caste and slavery. Here wives are made to toil as the property of the monarchs, and upon fields owned by the monarchs. In New Zealand there were three kinds of proprietors—the tribe, the family, and the individual. In Polynesia, generally, primitive equality has been wholly left behind, and property is

owned by chiefs. In Africa the aborigines have developed out of equality, but the degrees are not fixed. In southern Asia we find the Javanese *dessa* and Indian communal village. This is perhaps due to the necessity of collective irrigation of rice-fields. In ancient Egypt we have a kingdom something like that of the Incas; all nominally owned by kings, but divided into kings' lands, priests' lands, and warriors' lands. Beneath these grades are herdsmen, artisans, and slaves. In China land is nominally owned by the king, but allotted to families. It must be tilled, or can be forfeited. Land is inalienable. Village communities are traceable. In nomadic Arabia a system of combined individual and communal property exists. Among the Hebrews land was divided among all, by families. The early Aryan races seem to have practised the village community, and this brings us to historic times.

PRISONER OF WAR, TREATMENT OF THE:

In international law, a combatant or person in arms taken by the enemy either by capture or surrender in time of war, is a prisoner of war. By extension, he is any one attached to a hostile army for active aid; sometimes including also civilians such as correspondents, contractors, and sutlers. By the articles of the convention of Aug. 22, 1864, completed by additional articles in 1868, all medical persons, the wounded in ambulances, chaplains, and nurses are considered non-combatants.

Montesquieu, in his "Esprit des Lois" (bk. x., ch. iii.), says: "In the best days of Pagan antiquity the laws of war . . . decreed, with unyielding severity, confiscation and pillage for the possessions of the enemy; slavery or death for the enemy himself." Under the Romans, capitulation was not sufficient to save life. In the flush of their triumphs, they often put to death the enemy's chiefs, even tho they had become prisoners by surrender. When the putting to death of some prisoners became less frequent, they were deported, enslaved, drafted into the armies, or used in the arenas as prey for the wild beasts against which they were compelled to fight. Civilization and Christianity have brought about the modification of this treatment. Probably the most barbarous treatment of all was that practised by the ancient Britons on their captives. These were turned over to the priests and condemned to death by burning; then they were thrust into huge wicker-work cages with oxen and other beasts and burned or cast upon Druid altars to be slaughtered with knives. With the advent of the Roman dominion in Britain the Romans exterminated the Druids and their sacrifices were never revived. Sparing the lives of most of their captives, the Romans led many of them back to Rome in triumph and there they were sold as slaves or sent to the galleys.

When the Normans came to England they respected nothing; neither person nor property. Their prisoners, like so many cattle, became the prey of the conqueror. By right of might or violence, vassals became feudal lords, and seized for themselves daughters of noble families, while the former lords were reduced to serfdom. The Normans confiscated their property and with it lay the foundation of the nobility of today. During the wars between Richard I. and Philip Augustus each monarch blinded fifteen of the prisoners he had taken and sent them back to their camps in that state. While in Palestine, Richard himself ordered the massacre of 2,500 prisoners which he had captured.

With the dawn of Chivalry generosity to a fallen foe asserted itself, and the practise of ransoming prisoners was introduced. The condition of prisoners of war during this period was comparatively secure. Occasionally, it is true, entire garrisons were butchered, but, as a general rule, the captives were ransomed, exchanged, or deported. In the thirteenth century the custom of exchanging prisoners predominated. Then, too, the status of the prisoner of war changed. He was no longer the property of his captor nor that of the commanding officer, but of the government against which he had taken arms. Notwithstanding this, mutilation was still practised in some degree, as by the Japanese, who in their wars with Korea in the seventeenth century lopped off the ears of 3,600 Koreans, sending them home as trophies of their victory. Thus precedent was established for the treatment in recent times of the unfortunate Kongolese by the Force Publique of the Kongo Free State, members of whose troops are said to have cut off the fingers and hands of those who opposed them in the execution of their duty.

During the relentless War of Candia (1667-68) between the Venetians and the Turks, the latter, who ultimately captured the place, put 30,000 Christian prisoners to death in retaliation for their losses, which totaled 120,000 men.

According to modern international law, prisoners of war taken in battle must not be killed or enslaved. By a law passed June 20, 1792, French prisoners of war are placed under the protection of the nation and must be shielded from all insult or outrage. By a later decree (May 25, 1793), it was

ordered that no person captured from the enemy shall be compelled to serve in the army of the State by which he has been taken. With the Napoleonic Wars and the War of the Revolution came the incarceration of prisoners of war, who were often ill fed, poorly clothed, and subjected to gross indignities, being often compelled to perform work that would lessen the cost of their maintenance. On April 4, 1811, a decree promulgated ordered that a prisoner of war of the rank of officer and any hostage who violates his parole shall, if recaptured, be treated as a soldier, receive the same rations, and be confined in castle, citadel, or fort.

The attitude of the British authorities toward the American prisoners of war captured during the Revolutionary Period (1776-83) is shown by the method of imprisonment adopted. They put the captured men in condemned hulks which were moored in Wallabout Bay, New York. In these prison-hells they suffered from cold, hunger, thirst, and disease, so that no less than 11,400 died in less than six years.

The attitude of the American colonies toward prisoners of war during the Revolutionary War may be seen from letters written by Thomas Jefferson at that time. In regard to their comfort he said, writing to Governor Henry: "Is an enemy so execrable that, tho in captivity, his wishes and comforts are to be denied and even cruelties? I think not. It is for the benefit of mankind to mitigate the horrors of war as much as possible. The practice, therefore, of modern nations, of treating captive enemies with politeness and generosity, is not only delightful in contemplation, but really interesting to all the world, friends, foes, and neutrals."

That the health of prisoners should receive consideration also, Jefferson urged on Henry, saying:

"The health (of the British prisoners) is also of importance. I would not endeavor to show that their lives are invaluable to us, because it would suppose a possibility that humanity was kicked out of doors in America, and interest only attended to."

Negotiations for the exchange of prisoners having proved unsuccessful, Jefferson, writing to General de Riedesel, said: "I am sorry to learn that the negotiations for the exchange of prisoners have proved abortive, as well from a desire to see the necessary distresses of war alleviated in every possible instance, as that I am sensible how far yourself and family are interested in it."

Of the treatment accorded to Governor Hamilton by the Americans, Jefferson wrote to Sir Guy Carleton as follows:

"We think ourselves justified in Governor Hamilton's strict confinement on the general principle of national retaliation. Governor Hamilton's conduct has been such as to call for exemplary punishment on him personally. In saying this I have not so much in view his particular cruelties to our citizens, prisoners with him, as the general nature of the service he undertook at Detroit, and the extensive exercise of cruelties which it involved. Those who act together in war are answerable for each other. The known rules of warfare of the Indian savages is an indiscriminate butchery of men, women, and children. These savages, under this well-known character, are employed by the British nation as allies against the Americans. Governor Hamilton undertakes to be the conductor of the war. In the execution of that undertaking he associates small parties of the whites under his immediate command with large parties of the savages, and sends them to act, sometimes jointly, sometimes separately, not against our forts or armies in the field, but the farming settlements on our frontiers. Governor Hamilton is himself the butcher of men, women, and children. I will not say to what length the fair rules of war would extend the right of punishment against him; but I am sure that confinement under its strictest circumstances, for Indian devastation and massacre, must be deemed lenity."

In exchanging prisoners of war efforts were usually made to exchange like for like; that is, men of equal or nearly equal rank were transferred whenever possible.

In 1690 a marshal in the French army was considered worth as many as 10,000 soldiers, but a century later he was not considered worth more than fifty. The number of French prisoners exchanged by cartel in 1781 from the commencement of the war declared by France against England in 1778 was 44,000, and the

number of English prisoners taken by France during the war of the First Coalition (1792-97) was approximated at 6,000, while of French captives in England there were 27,000 in Sept., 1798. During the operations of the Third Coalition and subsequent war with France 47,600 French prisoners were transported to England and released at the close of hostilities.

Prisoners of war that fell into the hands of Napoleon, altho kept in confinement, were, with one notable exception, humanely treated—1,200 Turkish prisoners, the defenders of Jaffa, whom he could not transport and was unable to feed, were shot.

During the War of 1812 Great Britain transported to England a number of American soldiers and seamen who had been captured, and confined them in a prison on Dartmoor. Ill-fed and neglected the men rebelled, and during a riot that ensued (April 6, 1815) seven of the prisoners were killed and thirty-five wounded. The Prince Regent (afterward George IV.) ordered an investigation, and on receiving a report of the incident severely censured the officers in charge of the

prisoners of war. A pleasant contrast was afforded by the treatment accorded to American seamen who, having been taken prisoners during several naval engagements, in 1815, were conveyed to Bermuda, where they were kept in confinement, but where such Bermudians as were permitted to have access to them, extended "generous and tender sympathy" which "prompted the kindest attentions" to the living, and honored those who died during detention (Jan.-Feb., 1815).

The condition of the Russian prisoners taken by the Allies during the Crimean War (1854) was more pitiable than that of the regular troops, which was shameful. Owing to the breakdown of the commissariat, food supplies, clothing, and other necessities were sent to places where there was no need of them, while in others the troops suffered terrible hardships for lack of them. No less than 18,500 men died in the hospitals, which were frightfully mismanaged. Under such conditions prisoners fared severely.

The stern repressive measures taken by the British against the Sepoys during the Indian Mutiny (1857) were the result of the barbarisms which the Sepoys themselves practised on the Europeans who fell into their hands. The ruthless butchery of the white prisoners in Cawnpore was punished by the blowing from the mouths of guns the rebel leaders who had been captured.

During the American Civil War large numbers of prisoners were exchanged, but the Confederate Congress having passed an act (May, 1863) to

punish with death or otherwise all commanders of negro troops taken

in the field, this temporarily put a stop to release by exchange. Ne-

gotiations, however, were reopened

by General Grant, Oct. 15, 1864, and the Secretary of War reported that the number of prisoners

captured to 1864 was 152,434, of which 121,937 Confederates were exchanged for 110,866 Federal soldiers.

From Jan. 1 until Oct. 20, 1865, there were in the Federal prisons 98,802 prisoners

of war of whom 1,955 enlisted in the United States army. When fighting ceased, 63,442 prisoners were released, 33,127 were exchanged, and

174,223 surrendered in the Confederate armies and were released on parole. During the war the

U. S. established prisons at Camp Douglas, Utah; Camp Chase, Ohio; Chicago, Ill.; Elmira, New

York; Point Lookout, Maryland; and Rock Island, Ill., and here the Confederate prisoners of war were detained.

Of the prisons in the Confederate States these were situated at Andersonville, Ga.; Belle Isle;

Castle Thunder; the Libby at Richmond, Va., and Salisbury. Here Federal prisoners

were detained. Of these institutions the Libby Prison and that at Andersonville were notorious for

their unsanitary conditions. The Libby was a tobacco warehouse, three stories

high and containing six rooms 100 feet long by 45 feet wide. The building was situated on Main

Street and was surrounded by a stockade. Within its walls as many as 1,200 prisoners were

confined at one time. The prisoners suffered terribly from want of food, from cold due to scant

clothing, and neglect, and from the lack of proper sanitary arrangements, so that many died during

their confinement and others suffered permanently from impaired health.

Andersonville Prison was an open pen, 1,540 feet long by 750 feet wide. It was situated on a

hillside field and surrounded by a stockade. Within its walls 44,882 Union prisoners were

detained within one year, and of this number 12,926 died from starvation or lack of proper care.

After the close of the war Captain Henry Wirz, one of the officers who had charge of the prisoners and against whom gross cruelty was alleged, was indicted for "injuring the health and destroying the lives of prisoners by subjecting them to tor-

ture and great suffering, by confinement in unhealthy and unwholesome quarters, by exposing them to the inclemency of the winter and the dews and burning sun of the summer, by compelling the use of impure water, and by furnishing insufficient and unwholesome food; for establishing the dead-line and ordering the guards to shoot down any prisoner attempting to cross it; for keeping and using bloodhounds to hunt down prisoners attempting to escape; and for torturing prisoners and confining them in stocks.

A commission began the trial of Captain Wirz, Aug. 21, 1865, and he was found guilty and hanged on Nov. 10th. of that year.

The number of French prisoners taken by the Prussians in the Franco-Prussian War (1870-71) was enormous and they were transported to German soil. They were detained chiefly in fortified towns throughout Germany, the largest contingents being held in Berlin, Breslau, Cassel, Ingolstadt, Königsberg, Leipsic, Mainz, Magdeburg, Munich, Posen, Stettin, etc. Here the only restraint put upon them was presence at roll-call every morning, and report of return at night. During the day the prisoners were permitted to mix with the native population and to hire themselves out to work among such of the German people as could utilize their services. They were fed at their own camp or barrack kitchens, the German Government bearing the cost. Medical attendance was supplied the sick, and clothing served to the destitute. No statistics of the numbers captured and returned are available, but it is known that in the aggregate they totaled several hundred thousands.

In the course of the Russo-Turkish War of 1877 the Russian troops captured no less than 80,000 prisoners, many of whom were wounded and perished from cold during their removal to Russia (Dec., 1877), as no special provision had been made for their care.

During the Spanish-American War (1898) the number of Spanish troops surrendered at Manila was about 13,000, and the number at Santiago about 24,000. None of these prisoners were brought to or held in the U. S. In accordance with the terms of surrender, which contained a proviso that the prisoners should be returned home by the U. S., their return to Spain was conducted by the Quartermaster's Department of the U. S. army.

By the U. S. army regulations, money and other valuables found on a prisoner, such as jewelry and extra clothing, are considered as the private property of a prisoner and must not be appropriated by his captors. A prisoner of war is liable to such confinement as may be considered necessary for public safety, but is not to be the subject of indignity or intentional suffering. If he escapes he may be shot or killed as he flees, but for attempting to escape he is not amenable to military law, such attempt not constituting a crime, according to the rules of war.

A different method of treating prisoners of war was introduced by the Boers during the progress of their war against Britain (1899-1902). At first prisoners were conveyed to Pretoria. The officers were imprisoned in one of the schoolhouses there; the men were kept within a wire entanglement in one of the public squares in the town, where they were guarded by such volunteers as the Irish Brigade. As fighting

wore on and the Boer capitals were captured, the commandants found it most convenient to strip their prisoners of their clothing and other personal property and turn them loose. At Vlakfontein a British patrol of twenty men and a few native scouts surrendered to a commando of 200 Boers, who ordered the scouts to hold up their hands and shot them in cold blood. One of these was a white trooper from Cape Colony. Following this event Commandant Kruitziuger announced that he would shoot all natives, armed or unarmed, who were caught with the British. Fortunately for the reputation of the Boers as civilized people, the example set by Kruitziuger was not followed by his brother officers.

The treatment accorded to the Boer prisoners by the British was somewhat different. Laagers surrounded by wire entanglements to prevent escape were established at Simon's Town, St. Helena, Ceylon, and Bermuda. There the captured officers and men were transported. Within the laagers they were permitted to establish a government of their own, and only in cases of refractory prisoners was appeal made to the British adjutants in charge, who invariably referred such cases to their superiors. The prisoners were not required to do any work, but if they volunteered to do it, were paid at the same rate as British soldiers would be paid. They were allowed the freedom of the laagers and were permitted to bathe in the sea, but not allowed to swim beyond the military zone marked by buoys. The rations served to each prisoner first passed

Rations Served

a joint examination by Boer and British officers. Food declared unfit was promptly condemned. Each man was given per day 1 pound of fresh meat, 1 pound of biscuit or 1½ pounds of graham bread, ½ pound of fresh vegetables, ¾ ounce of ground coffee, 2 ounces of sugar, ½ ounce of salt, ¼ ounce of pepper, ⅓ gill of lime juice, 2 gallons of fresh water. In addition to the above, prisoners who had the means were at liberty to purchase luxuries, as fruit, fresh or canned; preserves; fish, smoked or dried; etc., from a Boeren winkel, or company store, maintained by the prisoners themselves for the common good. No restrictions were placed on fishing from shore, so that those who desired it could add to their rations in this way. In Bermuda, the one hardship was the quantity of fresh water supplied per man—two gallons being held not sufficient for their needs.

On the arrival of the prisoners at the detention camps, each man's kit was examined, and bedding was supplied to him. To those who were

Clothing Supplied

destitute of clothing, new clothing was served. This clothing was of the common kind usually supplied to army laborers, and on this account was occasionally the cause of complaint. Of the complement of prisoners sent to Bermuda (nearly 5,000), only five died from disease in two years and one was shot for attempting to escape. While at sea, on the voyage from Cape Town to Bermuda, twenty-one died from wounds, dysentery, and other causes due to exposure in the field.

The refugee camps established by the British in Cape Colony for the wives and children of the Boers in the field were not prisons in the military sense, and the persons detained were not strictly prisoners of war—the camps having been formed for the sake of the maintenance of the occupants

In the Boer War

in lieu of allowing them to starve to death on desolate farms. The refugees were housed in iron, wooden-lined buildings and marquees, each family having separate accommodation. A free government school where English and Dutch were taught was maintained. The cost of housing and feeding the 137,619 refugees and the 20,000 prisoners of war in various parts of the world was borne by the British taxpayer. Notwithstanding the care given to the treatment of the refugees, an outbreak of zymotic disease, chiefly measles, resulted in a high death-rate among the children. The total deaths of whites (adults and children) during six months of the year 1901 was 13,941—a rate which was gradually reduced as the Boers overcame their prejudices, observed the sanitary regulations made for their welfare, and took the medicine prescribed for them. Throughout the war all communications, such as telegrams and letters, were delivered subject to the censor and approval of the commanding officer.

During the Chino-Japanese War (1894-95) a marked change was noticed by the Chinese prisoners in the treatment accorded them by their foes. They could not account for it, especially as on the Japanese who fell in their hands they had perpetrated nameless atrocities. The common belief was that they were being fattened to kill and that they would have done better to die in battle. But the true cause of this was that in 1886 Japan joined the Red Cross nations. One notable exception was the treatment accorded the Chinese at the taking of Port Arthur (Nov. 21, 1894). Then, long after the surrender of the place, the Japanese continued the indiscriminate slaughter of the Chinese. This inhumanity has been attributed to the frenzied condition of the Japanese who were horrified at the mutilation of their men by the enemy.

As the Russo-Japanese War progressed (1904-1905) the Japanese Government issued regulations for the treatment of the Russian prisoners that fell into their hands.

JAPANESE REGULATIONS

(1) All prisoners of war shall be treated humanely; they shall not be subject to insult or cruelty. (2) They shall be treated in conformity to their rank and position. (3) Except where imposed by military discipline, they shall not be subjected to physical restraint. (4) They shall be at liberty to attend the religious services of their own faith, so long as in doing so they do not infringe the requirements of army discipline. (5) Insubordinate prisoners shall be subjected to disciplinary measures, according to the offense committed, and so also must prisoners who attempt to escape, or who may actually, for a time, contrive to get away and are retaken; no criminal punishment shall be inflicted on account of such attempt at escape. (6) Offenses of prisoners are dealt with and punished in conformity with the established rules of the military court.

(7) Officers to be transported to the place of their internment separately from the common soldiers. (8) The military authorities to provide places suitable for the internment of prisoners; soldiers' barracks, temples, or other convenient buildings are to be used for this purpose. (9) In each place of detention the inmates shall appoint one person to be their chief, who shall be responsible for his fellow prisoners. (10) Prisoners are at liberty to purchase with their own money any articles that may add to their comfort, subject, of course, to the approval of the superintending officer. (11) All telegrams or letters are subject to the approval of the supervising officer; no cipher or suspicious communication of any sort can be permitted to pass. (12) The postal matter sent to or from prisoners is free of charge, in accordance with the postal convention rules.

All articles or money held for safe custody by the Japanese were returned to the prisoners on their discharge. All articles or money belonging to prisoners who died were forwarded to the Prisoners' Intelligence Board.

The rations served to prisoners were based on an amount of money stipulated by schedule.

RATION SCHEDULE. PER PERSON PER DAY

| | Officers and their equals | Non-commissioned officers and men |
|---|---------------------------|-----------------------------------|
| Bread..... | 1½ kin ¹ | 1½ kin |
| Animal food (meat, fish, or poultry)..... | 100 monme ² | 50 monme |
| Vegetables..... | 120 monme | 80 monme |
| Table salt..... | 5 monme | 5 monme |
| Sugar..... | 4 monme | 3 monme |
| Appetizers..... | Some | Some |

¹ Equals 1.325 pounds avoirdupois.

² 1 gram equals ⅓ monme.

The foregoing was modified according to climatic conditions. The amount per diem allowed for the cost of these rations was, for officers and their equals, 60 sen; for non-commissioned officers and men, each 30 sen—a sen is about four fifths of a cent.

Each person of the rank of sergeant-major and above was allowed bed, blankets, and a toilet set, which was loaned to the captives. To non-commissioned officers and men, blankets or wadded quilts were loaned individually, and toilet sets in groups. Of clothing each prisoner wore what he possessed; when that wore out a new suit was lent to prisoners of the rank of officers or above, and second-hand clothing to non-commissioned officers or privates.

The prisoners were quartered at Matsuyama. The officers had quarters in a Buddhist Temple in a wooded park there. The other prisoners were stationed in temples and large bamboo barracks and hospital wards. Their physical condition could not have been better. That the number of prisoners was enormous is shown by Japan's bill for their maintenance. It amounted to about \$75,000,000, the last payment of which (\$24,302,200) was made Nov. 23, 1907.

Of the treatment accorded to the Japanese by the Russians, little or nothing has been published, and no official information is available, but it is known that Russia's expenses for the maintenance of Japanese prisoners were \$40,000,000.

During the last fifty years great strides have been made in the care of prisoners of war. From imprisonment, as if criminals, they have now been emancipated. Sympathy for the conquered by the conqueror has shown itself until, among civilized nations, the sick receive free medical attendance and the healthy are well fed, well housed, and plainly but serviceably clothed. As much attention has been given to their physical well-being as to their treatment. This has been due as much to the placing of prisoners in charge of humane officers as to international comity. Russian prisoners mostly played ball; Boer prisoners enjoyed the privilege of cricket, croquet, football, gymnastics, and various games of ball. Gymnastic appliances, as horizontal and parallel bars, etc., were supplied in several of the detention camps. Schools were conducted, and the prisoners were also permitted to make tennis-courts and billiard-tables for their use. Card games were few. Athletic sports were freely indulged in.

The question of the admission of liquor to the camps was purely one of local option and its exclusion was voted in all. To this may be attributed, in some degree, the small death-rate among the prisoners detained, and the total absence of rioting.

FRANK H. VIZETELLY.

PROBATION AND PROBATION OFFICERS:

Probation in sociology means the suspension of sentence chiefly of juvenile and first offenders for transgressions of not too serious a nature. It rests on two principles: (1) It draws a distinction between those who have transgressed the law from some definite and immediate cause—e. g., hunger, sudden impulse or passion, etc.—and those who are thoroughly vicious and have criminal tendencies. (2) It is a postponement of condemnation while the offender is given an opportunity to redeem himself and become a useful member of society. Probation officers are persons into whose care and supervision the offenders are put while under probation. They may be paid officials of the state or municipalities, or private individuals interested in the prevention of further transgressions by first or juvenile offenders.

Massachusetts passed a law for the establishment of the probation system in 1878. The procedure is briefly this: The probation officer receives notice in the case of a first offender from the clerk of the court, to make investigations concerning him and report. On the day of trial this report is submitted to the judge, and practically decides whether the accused—if found guilty—is considered fit for probation or not. If fit, the judge determines the period during which the offender is to be under the surveillance of the probation officer—the latter becoming "the bondsman to save the offender from prison." The officer has to report to the judge at stated intervals; and if these reports and the behavior of the probationer are satisfactory, sentence may be suspended by the court for a longer period, or canceled. Otherwise it may be pronounced and go into effect at once.

This system of redeeming offenders from prison is now practised extensively both in Europe and America. In Massachusetts 8,140 persons of all ages were placed on probation during 1903, and about 65 per cent proved successes. New York requires probation for at least one year, and the probation officer of Brooklyn advocates its extension to three or four years so as to establish thoroughly friendly relations. In the case of juvenile offenders the process is this: *reformatory* on indeterminate sentence; *release* "on parole" for good conduct under a probation officer; period of probation; period of indefinite suspension of sentence.

Germany's probation law provides for a Court of Guardianship—consisting of local officials, the parents, clergymen, schoolmasters. The advantage of this system is that a number of persons become responsible for and interested in the transgressor—one person is, however, appointed probation officer in each case, and responsibility is centralized. The law of Hungary resembles that of Germany. In Holland, Belgium, France, and Switzerland authorized private organizations—*Sociétés de Patronage*—assume the responsibilities for juvenile offenders.

The question is, whether the expenses connected with this system are a good investment. Massachusetts, for instance, pays probation officers from \$1,500 to \$1,800 per year; New York has just (June 6, 1907) passed a law to create a *State Probation Commission* with voluntary members, but a paid secretary with a salary of \$3,000 a year plus funds for stenographer, etc. The expenses are likely to grow as the probation system develops, and objections are raised. It

would be a good investment even if it saved only one half of the probationers from a career of crime. A German report ("Statistik über die Fürsorge-Erziehung") says that the total cost of over £300,000 per annum in Germany would be amply compensated by restraining only 25,000 offenders for one year from further transgressions. The gain to the State in better citizens is, of course, not expressible in figures.

PROFIT (for facts and statistics as to profits, see following article): The word profit is used in political economy by different writers in different senses. It is not at all difficult to understand its different uses, but great care must be taken to be sure that one knows the sense in which an author uses it, before one can judge or understand his meaning. The failure to do this has led to endless popular confusion, and not seldom to inaccurate statements by economists themselves.

Adam Smith defines it as "the revenue derived from stock (capital) by the person who manages or employs it" ("Wealth of Nations", 1. 7). Mill defines it ("Polit. Econ.", chap. xv., § 1) as "the gains of the person who advances the expenses of production—who, from funds in his possession, pays the wages of the laborers, or supports them during the work, who supplies the requisite buildings, materials, and tools, or machinery; and to whom, by the usual terms of the contract, the produce belongs, to be disposed of at his pleasure."

Jevons ("Primer of Political Economy," p. 52) uses it of wages of superintendence, interest, and recompense for risk. He says:

"The proper share of the capitalist is interest; but this is usually a good deal less than what actually remains in the hands of the capitalist. Business is generally carried on by some capitalist who rents a piece of land, builds a factory, purchases machinery, and then employs men to work the machinery, paying them wages. The capitalist himself often acts as manager, and works every day almost as long as the workmen. When the goods are finished and sold, he keeps the whole of the money he gets for them; but then he has already paid out a large sum as wages, while the goods were being made; another part goes to pay the rent of the land which he has hired. Having struck off these portions, there ought to remain a certain profit, part of which he uses to live upon. But even this profit consists of more than interest upon his capital. It should include also a payment for his labor in superintending the business. The manager of a factory may seldom touch the cotton, flax, iron, or other material, which is manufactured; nevertheless, he works with his head and his pen, calculating the prices at which he can produce goods, inquiring where he can buy the materials most cheaply, choosing good workmen, keeping the accounts straight, and so on. Severe mental labor is really far more difficult and exhausting than manual labor; and in raising up a good business, and carrying it through times of danger, a manager has to undergo great anxiety and mental fatigue. Thus, it is necessary that a successful manager should receive a considerable share of the produce, so as to make it worth his while to give this labor. His share is called the wages of superintendence, and, altho usually much larger than the share of a common laborer, it is really wages of the same nature."

What Profit Is

"Another part of the capitalist's so-called profit ought to be laid aside as recompense for risk. There is always more or less uncertainty in trade, and even the most skilful and careful manager may lose money by circumstances over which he has no control. Sometimes, after building a factory, the demand for the goods which he is going to produce falls off; sometimes the materials cannot be bought; perhaps it is discovered, when too late, that the factory has been built in an unsuitable place; occasionally, too, the workmen are discontented, and refuse to work for such wages as the capitalist can afford to pay. Now, whenever any of these mistakes or misfortunes happen, it is the capitalist who mainly suffers, because he loses a great deal of money, on which he might otherwise have lived comfortably."

Professor Ely uses the word to exclude interest and wages of superintendence. He says ("Political Economy," p. 217, 1st ed.):

"Whatever is left after paying interest, rent, and wages is profits. It is the return which is received for the organization and management of a business at one's risk. It is, strictly speaking, not "wages of superintendence," for that may be deducted, and often is deducted."

Profits then may be considered (1) to be what the stockholders or owners of a business receive after those who manage the business have received their "wages of management," after the capital invested or borrowed has received its due interest, and after payment has been made for risk; or (2) profit may be used in a larger sense to include one or more of all these items.

Of the law which governs profits we have many statements. John Stuart Mill says ("Political Economy," 5th London ed., book ii., chap. xv.):

The lowest rate of profit which can permanently exist is that which is barely adequate, at the given place and time, to afford an equivalent for the abstinence, risk, and exertion implied in the employment of capital. . . . Such, then, is the minimum of profits; but that minimum is exceedingly variable, and at some times and places extremely low; on account of the great variability of two out of its three elements. The rate of necessary remuneration for abstinence, or, in other words, the effective desire of accumulation, differs widely in different states of society and civilization. . . . There is still a wider difference in the element which consists in compensation for risk. . . . But the profits thus vary, the parity, on the whole, of different modes of employing capital (in the absence of any natural or artificial monopoly) is, in a certain and a very important sense, maintained. On an average (whatever may be the occasional fluctuations), the various employments of capital are on such a footing as to hold out, not equal profits, but equal expectations of profit, to persons of average abilities and advantages. By equal, I mean after making compensation for any inferiority in the agreeableness or safety of an employment.

Law of Profits

Representing much later and, at present, far more generally accepted thought, Professor Marshall says ("Economics of Industry," book vi., chap. viii.):

The profits of a business are the excess of its receipts over its outgoings, and the annual rate of profits is the ratio which the yearly profits bear to the capital invested. We have next to inquire whether there is any general tendency of the rate of profits to equality.

The first difficulty arises from the fact that the outgoings of a business, and therefore its profits, are not always estimated in the same way. This was well pointed out by Adam Smith, who said: "The whole drugs which the best employed apothecary in a large market-town will sell in a year may not perhaps cost him above thirty or forty pounds. The he should sell them, therefore, for three or four hundred, or a thousand per cent profit, this may frequently be no more than the reasonable wages of his labor in the only way in which he can charge them upon the price of the drugs. The greater part of the apparent profit is real wages disguised in the garb of profit. In a small seaport town a little grocer will make 40 or 50 per cent upon a stock of a single 100 pounds, while a considerable wholesale merchant in the same place would scarce make 8 or 10 per cent upon a stock of 10,000."

Professor Marshall's View

There are even reasons for thinking that the rate of profit, rightly estimated, on large capitals tends to be higher than on small. For of two businesses competing in the same trade, that with the larger capital can nearly always buy at a cheaper rate, and can avail itself of many economies in the specialization of skill and machinery and in other ways, which are out of the reach of the smaller business; while at most the only important advantage which the latter is likely to have consists of its greater facilities for getting near its customers and consulting their individual wants.

There are some trades which require a very high order of ability, but in which it is nearly as easy to manage a very large business as one of moderate size. In rolling-mills, for instance, there is little detail which cannot be reduced to routine, and a capital of £1,000,000 invested in them can be controlled by one able man. A rate of profits of 20 per cent, which is not a very high average rate for some parts of the iron trade, would give the owner of such works earnings of management amounting to more than £150,000 a year. And since ironmasters can with so little additional effort get the earnings of management on an increased capital, wealthy men remain in the trade longer than in most others; and the competition of the great ironmasters with one another is said to have reduced the average rate of profits in the trade below the ordinary level.

The rate of profits is low in nearly all those trades which require very little ability of the highest order, and in which a public or private firm with a good connection and a large capital can hold its own against newcomers, so long as it is managed by men of industrious habits and sound common

sense and a moderate share of enterprise. And men of this kind are seldom wanting either to a well-established public company or to a private firm which is ready to take the ablest of its servants into partnership.

We may then conclude, firstly, that the true rate of profits in large businesses is higher than at first sight appears, because much that is commonly counted as profits in the small business ought to be classed under another head. . . .

Profits are exceptionally high where the wages bill is very large, relatively to the capital. . . .

It is obvious that wholesale dealers who buy and sell large quantities of produce in single transactions, and who are able to turn over their capital very rapidly, may make large fortunes, tho their average profits on the turnover are less than 1 per cent; and, in the extreme case of large stock exchange dealings, even when they are only a small fraction of 1 per cent. But a ship-builder, who has to put labor and material into the ship, and to provide a berth for it, a long while before it is ready to sail, and who has to take care for every detail connected with it, must add a very high percentage to his direct and indirect outlay in order to remunerate him for his labor and the locking up of his capital.

Again, in the textile industries, some firms buy raw material and turn out finished goods, while others confine themselves to spinning, to weaving, or to finishing; and it is obvious that the rate of profit on the turnover of one of the first class must be equal to the sum of the rates of profit of one of each of the three other classes. Again, the retail dealers' profit on the turnover is often only 5 or 10 per cent for commodities which are in general demand, and which are not subject to changes of fashion; so that, while the sales are large, the necessary stocks are small, and the capital invested in them can be turned over very rapidly, with very little trouble and no risk. But a profit on the turnover of nearly 100 per cent is required to remunerate the retailer of some kinds of fancy goods which can be sold but slowly, of which varied stocks must be kept, which require a large space for their display, and which a change of fashion may render unsalable except at a loss; and even this high rate is often exceeded in the case of fish, fruit, flowers, and vegetables.

To pass to another point, the number of those who succeed in business is but a small percentage of the whole; and in their hands are concentrated the fortunes of others several times as numerous as themselves, who have made savings of their own, or who have inherited the savings of others and lost them all together with the fruits of their own efforts, in unsuccessful business. In order, therefore, to find the average profits of a trade we must not divide the aggregate profits made in it by the number of those who are reaping them, nor even by that number added to the number who have failed; but from the aggregate profits of the successful we must subtract the aggregate losses of those who have failed, and perhaps disappeared from the trade; and we must then divide the remainder by the sum of the numbers of those who have succeeded and those who have failed. It is probable that the true gross earnings of management—that is, the excess of profits over interest—is not on the average more than a half, and in some risky trades not more than a tenth part, of what it appears to be to persons who form their estimate of the profitability of a trade by observation only of those who have secured its prizes. There are, however, reasons for thinking that the risks of trade are on the whole diminishing rather than increasing.

John Stuart Mill adds an important point. He says ("Political Economy," book ii., chap. xv., § 5):

To popular apprehension it seems as if the profits of business depended upon prices. A producer or dealer seems to obtain his profits by selling his commodity for more than it cost him. Profit altogether, people are apt to think, is a consequence of purchase and sale. It is only (they suppose) because there are purchasers for a commodity, that the producer of it is able to make any profit. Demand—customers—a market for the commodity, are the cause of the gains of capitalists. It is by the sale of their goods that they replace their capital and add to its amount.

This, however, is looking only at the outside surface of the economical machinery of society. In no case, we find, is the mere money which passes from one person to another the fundamental matter in any economical phenomenon. If we look more narrowly into the operations of the producer, we shall perceive that the money he obtains for his commodity is not the cause of his having a profit, but only the mode in which his profit is paid to him.

The cause of profit is that labor produces more than is required for its support. The reason why agricultural capital yields a profit is because human beings can grow more food than is necessary to feed them while it is being grown, including the time occupied in constructing the tools and making all other needful preparations; from which it is a consequence that, if a capitalist undertakes to feed the laborers on condition of receiving the produce, he has some of it remaining for himself after replacing his advances. To vary the form of the theorem: the reason why capital yields a profit is because

Labor, the Source of Profit

food, clothing, materials, and tools last longer than the time which was required to produce them; so that if a capitalist supplies a party of laborers with those things, on condition of receiving all they produce, they will, in addition to reproducing their own necessities and instruments, have a portion of their time remaining, to work for the capitalist. We thus see that profit arises, not from the incident of exchange, but from the productive power of labor; and the general profit of the country is always what the productive power of labor makes it, whether any exchange takes place or not. If there were no division of employments, there would be no buying or selling, but there would still be profit. If the laborers of the country collectively produce 50 per cent more than their wages, profits will be 50 per cent, whatever prices may or may not be. The accidents of price may for a time make one set of producers get more than 50 per cent, and another less; the one commodity being rated above its natural value in relation to other commodities, and the other below, until prices have again adjusted themselves; but there will always be just 50 per cent divided among them all.

All economists, however, do not agree with Mill that the cause of profit is that labor produces more than is required for its support. They deny the fact. Mr. Edward Atkinson, e. g., argues that capital is as necessary to labor as labor to capital. He says ("The Industrial Progress of the Nation," p. 147):

Many an honest workman now sincerely contests the equity of distribution by way of capitalists. What is the true answer? There is and there can be but one reply to this question. Labor does not

Part Played by Capital

produce the entire product; it only shares in the work as it shares in the product. Without capital labor alone would be almost incapable of sustaining those who constitute the mere working classes in the narrowest sense. Capital is a force, and capitalists are those who direct this force. By the direction which the owners or the administrators of capital give to this force, which requires mental work of the most uncommon kind, the joint product of labor and capital is so much increased that even tho the capitalist secures to his own use a large part of the joint product, what is left to the workman is more in quantity and in value than he could otherwise have attained by his own unaided efforts.

Mr. Atkinson says elsewhere ("The Distribution of Profits," p. 38): "The late Cornelius Vanderbilt may be taken as an example of a communist in a true sense. He was the greatest communist of his age. He consolidated and perfected the railroad service in such a way that a year's supply of meat and bread can be moved 1,000 miles from the Western prairies to the Eastern workshop at the measure of cost of a single day's wages of a mechanic or artisan in Massachusetts."

Says Mr. George Gunton ("Wealth and Progress," chap. i.):

The idea most prevalent, indeed, well-nigh universal, among working men regarding the production of wealth, to use the official language of the largest labor organization in the world,¹ is: "(1) That labor creates all wealth. (2) That all wealth belongs to those who create it." From this it manifestly follows that all wealth rightfully belongs to the laborer. Hence, all who obtain wealth without his consent do so by cheating him out of the product of his labor, and are "thieves and robbers."

This is not merely the official dogma of a single society, but it constitutes the basis of nearly every proposition and the essence of nearly all economic literature put forth in the name of industrial and social reform. With financial reformers the robbery is labeled "interest and usury"; with land reformers it is "rent," and with the Socialists, in the language of their own economist, Karl Marx, it is "surplus value," which is more sweeping than any of the others, and includes all rents, profits, and interest.

If this formula is correct, and all profits, interest, rents, etc., are "exploitation"—mere plunder of the laborer—clearly the working men would be justified in using any means within their power to take possession of all the wealth in the community, as many of their leaders are expecting them some day to do.

But is it correct? If the first proposition is true, the balance of the formula is indisputable; but if it is not true, then the whole fabric falls, and all efforts at social reformation based upon it must surely fail to produce the desired and expected result.

A very little reflection will suffice to show that this proposition, while seemingly true, is essentially false. . . . There are clearly two sets of forces or two kinds of motor power that can be employed in producing wealth. One is labor power engendered and put forth by human beings; the other is natural power engendered and put forth by material objects,

as capital (machinery, etc.). The former is slow, clumsy, and ineffectual, and capable of very little increase, while the latter is rapid, exact, and powerful, and is capable of indefinite increase.

Accordingly, in proportion as wealth is produced by human labor it is scant and dear, and the masses are poor and barbarous; and according as it is produced by natural forces (steam, etc.) it is abundant and cheap, and the masses are materially prosperous and socially civilized. Thus, e. g., in India, where wealth is produced mainly by human labor, the annual earnings are about £2 (\$10) per capita of the population, as against £13 (\$165) per capita in this country, where human labor supplies the smallest per cent of the productive power of any country in the world.² The same is true of other countries.

Hence we find that in England over 78 per cent of the productive power is furnished by steam, as against 10 per cent in Russia. In Spain, 24; Italy, 34; and Portugal, 42 per cent of the productive power is furnished by human labor, as against 4 per cent in England and America.

It is, therefore, clear that human labor does not, except under the most primitive state of savagery, "create all wealth," and that the social condition of the laborer is not necessarily the best when he gets the whole product; but, on the contrary, wealth is produced by the combined effort of labor and capital, and that, according as the proportion of the total wealth produced by human labor diminishes, the actual amount the laborer receives increases.

Most Fabian Socialists do not hold that labor produces all wealth. They argue that wealth comes from land, labor, and capital.

Socialist View

They agree, however, with the Marxian Socialists that labor should get all the wealth, because they believe that all men should labor, and that it is neither wise nor just that one class in the community should own the land and capital and be paid for their use, and another class furnish the labor and be paid for their work. They would have the same men and women (the whole community) own the capital and land and furnish the labor, and so receive the whole product. The Socialist's and the workman's quarrel is not with capital, but with the capitalist; that is, with the wage system where one class does the work and another class furnishes the capital.

Already the share that goes to capital as a whole is falling, even tho, by concentration, a few capitalists are gaining enormous wealth. The profits on capital may fall so low as to fail to induce men to furnish capital or allow them to live on the returns to capital; then a cooperative system will become necessary, or the whole community be compelled to work and be paid by a few successful capitalists who will get enormous returns, at very low rates, from still more enormous investments.

That the rate of profits is falling is not denied. Says Professor Marshall ("Economics of Industry," book ii., chap. xii., §§ 7-8):

The total amount of the earnings of management got by business men in a country may be found by subtracting interest on the whole amount of their own capital from their total net incomes after allowing for all expenses and losses; and, even after allowance has been made for insurance against personal risks, this amount certainly gives a very high rate of wage for the skill and ability of business men. But this rate is not so high as at first sight appears; for great deductions must be made on account of those who have lost their capital in trade. The earnings of the labor that these men have wasted, together with all the capital that they have lost, must be deducted from the earnings of management got by successful men before the average earnings of management can be found. Those who fail are quickly lost from sight and memory; but their number is very great. It is said that in America three fourths of those who engage in trade become insolvent in the course of the first five years (Bowen, "American Political Economy," chap. x.).

§ 8. The supply of skilled labor is increasing faster than that of unskilled labor, and the supply of business power is

¹ "Polity of the Labor Movement," vol. i., p. 4, published by the Knights of Labor, 1885.

² See Mulhall's "Progress of the World," p. 48.
³ Ibid., "History of Prices," p. 53.

increasing faster than that of the lower kinds of skilled labor. Thus the competition of business power for the aid of the lower orders of labor in production is increasing. And, as a consequence, the earnings of management that can be got by doing work of a given order of difficulty—the task-earnings of management—are diminishing. The continual increase in the complexity of business, and the continual increase in the amount of capital that can be employed in business under a single management, are indeed giving to business ability of the highest order the opportunities of obtaining greater earnings of management than were ever heard of in earlier generations. But the total amount of the earnings of management is not so high in proportion to the amount of capital employed as it used to be. And the ratio which the earnings of management of a business bear on the average to the capital employed goes on diminishing; and will probably continue to diminish. For the growth of education will increase rapidly the supply of business power that is competing for the aid of hired labor in production; and this competition will prevent the earnings of management from growing as fast as capital is likely to grow.

Since the normal rate of interest is likely to fall, and the ratio which normal earnings of management bear to capital is likely to fall, and since profits are composed of interest and earnings of management, therefore the normal rate of profits is likely to fall. It will not fall rapidly for a time, and then remain stationary at a minimum. But subject to some oscillations its fall will probably be continuous, the increasingly slow, so long as the world is inhabited by men of the same nature with ourselves.

So argues Mr. Edward Atkinson. He says ("The Industrial Progress of the Nation," p. 305):

Under existing institutions and laws the working classes, in the sense in which they use that word, have been securing to their own use and enjoyment an increasing share of an increasing product. 2d. The richer classes controlling and using capital are securing to their use, control, and enjoyment a decreasing share of the same increasing product.

For Mr. Atkinson's proof of this, as also for contrary views, see articles WEALTH and WAGES.

PROFITS (NET): For a discussion of the principles involved, see PROFIT. We are concerned here simply with the facts. Statistics as to net profits, and conclusions deduced from them, must be suspiciously viewed. The "Twenty-first Annual Report of the Massachusetts Bureau of Statistics of Labor" reports on the net profits of sixty-four manufacturing industries in that state, but even this report has been most severely criticized. We give its conclusions, and some of the criticisms upon it. Says the report (pp. 623-630):

We first bring forward the following general caution: No one should make use of these tables without careful consideration of the analyses for each industry which follow the tables. These analyses are intended to supplement the tabular presentations, as deductions drawn from the figures alone, without due regard to the analyses, would, in many cases, be misleading.

In the returns as to net profits 10,013 establishments are represented, representing 75.45 per cent of the grand aggregate of capital invested in all establishments in all industries, and in them was produced nearly 70 per cent of the entire product turned out in the manufacturing and mechanical industries in the commonwealth. Of the 10,013 establishments, 9,251, or 92.39 per cent, made a profit, while 762, or 7.61 per cent, did not make a profit. The establishments making a profit had 81.22 per cent of the capital invested, and made 88.77 per cent of the goods manufactured. The establishments not making a profit had 18.78 per cent of the capital invested, and made 11.23 per cent of the goods manufactured. The result for all industries was a net profit amounting to 3.90 per cent of the selling price, and equivalent to 4.83 per cent on the capital invested.

Out of the grand total of \$500,594,377 of capital invested in manufacturing and mechanical industries in the commonwealth, land, buildings, and fixtures are valued at \$118,886,643, or 23.74 per cent of the total; machinery, implements, and tools at \$115,254,330, or 23.03 per cent; cash at \$173,440,947, or 34.65 per cent; and credit at \$93,012,457, or 18.58 per cent. For every \$100 invested the proportions of the details are as follows: Land, buildings, and fixtures, \$24; machinery, implements, and tools, \$23; cash, \$35; credit capital, \$18. The total plant values represent \$47, and the total cash and credit capital, \$53.

As to cost of production, each \$100 of total cost includes the following elements: Stock (including raw or manufactured materials), \$67.67; salaries, \$1.98; wages, \$25.66; rent, 85 cents; taxes, 64 cents; insurance, 38 cents; freight, \$1.46; new equipments, 28 cents; repairs, 93 cents; other expenses, 15 cents; these items aggregating \$100, or 100 per cent, if the items are considered as percentages instead of dollars and cents. By total cost is meant the cost to the manufacturer of the completed product, ready for sale, but excluding profit.

As to selling price, each \$100 of selling price includes the following elements: Stock, or materials, \$58.91; salaries, \$1.73; wages, \$22.34; rent, 73 cents; taxes, 56 cents; insurance, 33 cents; freight, \$1.27; new equipment, 24 cents; repairs, 81 cents; expenses not previously enumerated, 13 cents. In each \$100 there is an excess of selling price above the cost of production amounting to \$12.95. This \$12.95 is the manufacturer's gross profit, and is equivalent to 16.01 per cent on the amount of capital invested in, and needed to carry on, his business. These items, as enumerated, including gross profit, aggregate \$100, or 100 per cent, if the items are considered as percentages of selling price instead of dollars and cents. By selling price is meant the price for which a given quantity of manufactured product is sold by the manufacturer, and it includes, as shown above, cost of production, and profit, if any.

Of the sixty-four industries considered in the investigation all but one, print works, dye works, and bleacheries, show an excess of selling price above the cost of production; that is, all but one made a gross profit. The net profit was determined by the following deductions, determined upon after careful consideration:

| | |
|--|-------------|
| Interest on cash and credit capital..... | 5 per cent |
| Depreciation in the value of machinery, implements, and tools..... | 10 per cent |
| Allowance for selling expenses, losses, and bad debts..... | 5 per cent |

After these deductions were made 58 out of 64 industries exhibited a net profit.

The excess of selling price above the cost of production amounts, on an average, to \$12.95 in each \$100 worth of manufactured product. If from this \$12.95 excess are deducted the following: \$2.15 for interest, \$1.90 for depreciation on machinery, implements, and tools, and \$5 for selling expenses, and to make up for losses from bad debts, there will then remain as net profit \$3.90, which is equivalent to 4.83 per cent on the amount of capital invested, or an annual return of \$4.83 upon each \$100 of invested capital.

In private firms, each of 257,650 employees (including both sexes and all ages) receives an average of \$36.23 for annual earnings in return for his labor, while each of 12,558 partners in private firms, with an average investment of \$10,701, receives an average net profit of \$517 in return for his money investment and his labor.

Earnings and Profits

In corporations, each of 162,310 employees (including both sexes and all ages) receives an average of \$33.22 for annual earnings in return for his labor, while each of 30,967 stockholders in corporations, with an average investment of \$7,857, receives an average net profit of \$379 in return for his money investment, mainly, as comparatively few stockholders render any personal service, unless paid salaries therefor, to the corporations in which they are financially interested.

As a general result in all industries it appears that: First, in private firms, the percentage of the average yearly earnings of each employee of the average net profit to each partner is 70.02, or a little more than seven tenths; second, in corporations, the percentage of the average yearly earnings of each employee of the average net profit to each stockholder is 87.86, or a little more than seven eighths. These figures show the narrow money margin between the earnings of employees and the net profits of partners and stockholders.

If net profits are added to the wages fund, and the sum is divided equally among the employees, the employees of private firms would receive, on the average, an increase of \$37.47, or 10.34 per cent, on their present average annual earnings; the employees of corporations would receive an advance of \$89.44, or 26.84 per cent, while the employees of all establishments, including both private firms and corporations, would receive an advance of \$57.55, or 16.40 per cent, on the average, above their present average annual earnings.

Eliminating 71,025 partners and stockholders, and assuming that all the gross profits and the wages fund go to the employees, then each employee, regardless of sex or age, would receive \$541.86 for an annual income, or \$10.42 per week on the average. Of the employees now employed in manufacturing industries in Massachusetts 38.70 per cent receive more than \$10 per week under the present application of the wage system.

If gross profits are added to the wages fund, and the sum is divided equally among the employees, the employees of private firms would receive, on an average, an increase of \$124.24, or 34.30 per cent, on their present average annual earnings; the employees of corporations would receive an advance of \$296.55, or 89 per cent, while the employees of all establishments, in-

cluding private firms and corporations, would receive an advance of \$190.84, or 54.07 per cent, on the average, above their present average annual earnings.

In the case of private firms, if net profits and wages are added together, and divided equally between the employees and partners, the employer thus sharing alike with each of his employees, the amount falling to each would be \$360.15; in the case of corporations, each employee and stockholder would receive \$334.57, while, as a grand aggregate for all establishments (including private firms and corporations), the wages fund and net profits combined would give \$349.47 to each employee, partner, or stockholder.

On the share-and-share-alike plan (or an equal division among employees, partners, and stockholders of the net profits and wages fund combined), the average annual earnings per employee would have been \$349.47 instead of \$351.02, or a decrease of 0.44 per cent; the net profits per partner would have been \$349.47 instead of \$341.20, or an increase of 2.42 per cent; and the net profits per stockholder would have been \$349.47 instead of \$339.71, or an increase of 2.87 per cent.

Assuming that giving the entire net profits or the entire gross profits to labor would be more than just to labor, and consequently unfair to capital, and also assuming that the share-and-share-alike plan is just and fair to both labor and capital, these results prove that the average financial condition of the employee shown under the wage system is slightly better, as a general average, than it would have been if the net profits had been added to the wages fund, and the sum equally divided between the employees and their employers.

The average annual financial returns to the employee from the wage system, and from a plan in which the net profits and the wages fund, if combined, were divided equally between employees and their employers, are substantially the same, the variation being but \$1.55 per year, that sum being the excess paid by the wage system over and above what would have been derived from the share-and-share-alike plan.

The report says further, pp. 629-630:

The results of the investigation seem to warrant the inference that material improvement in the workingman's condition is not to be expected from an increase of his money wages gained by adding to a portion of the profits now absorbed by capital, but rather from an increase in his real wages, gained through materially increased production, accompanied by materially reduced prices, with consequent increased consumption; the rise in the standard of living implied by the increased consumption being accompanied and still further raised by reduced hours of labor.

In the light of the results, too, it would seem that theories of industrial reform which relate chiefly to changes in the mode of distribution of the existing results of production should give place in importance to plans involving an increase in production itself, whereby both labor and capital may have more, without diminishing the amount which either now receives.

So far as cooperation, profit-sharing, or any other scheme of industrial reform involves an increase of production, so far it moves in the right direction. But the success of any such scheme would seem to rest

Conclusions largely upon its power to augment production in the aggregate, by stimulating endeavor, diminishing waste, promoting harmony, simplifying management, or otherwise, rather than in the changes it might introduce in the mode of division of the fruits of production.

The general results of the investigation indicate average conditions—but no one sees such conditions. We see the exceptionally prosperous establishment, or the very rich manufacturer, and are apt to consider that all manufacturing is equally prosperous, and all manufacturers equally rich. The bankruptcy court shows the other side of the picture, but its records do not appeal to the eye or the imagination as does a large factory or an imposing mansion.

The results, on the percentage basis, for net profits show that in few industries, if any, can the profits be called exorbitant, all things considered, for we find the largest percentages of net profit in the small industries, while large industries involve small profits, and, sometimes, large losses. As to the general result for all industries, no one, we think, will maintain that the percentage of net profit is excessive. While it is true that this conclusion is based upon an average, and may not show the condition in any one industry, it must be remembered that any of the proposed changes so frequently urged for the improvement of our industrial system must be measured by its effect upon average conditions, and that such changes may be fairly tested by comparing the new averages resulting from them with those based upon conditions now prevailing.

Where are we, then, to look for the margin between cost of production and the price to the consumer? If neither the workingman nor his employer is profiting unduly by the present system, may it not be possible that the middleman, or the distributor of wealth in its various forms, may be securing more than his rightful share, and is thus bearing down upon the two extremes between which he is placed? Are not the creators and the consumers of wealth suffering in common

from the exactions of the distributors of wealth? This question cannot be answered from data now at hand, but it is evident that the mechanism of distribution, as well as the mechanism of production, must be brought to the statistical basis before the final solution of the question of profits will be secured.

This report, however, seems open to the severest criticism. Says the *Christian Union* for Oct. 3, 1891:

The Massachusetts returns were utterly untrustworthy. One large industry reported a net loss amounting to 28 per cent of the value of the goods sold. Yet the returns of the manufacturers are much less misleading than the deductions of the commissioner who has edited them. The manufacturers in estimating their profits naturally deducted whatever they paid as rent, and this amounted to 4 per cent upon the capital invested in lands and buildings. The commissioner obligingly supplements this deduction by a further one of 5 per cent for "interest" upon the cash and credit capital invested. The manufacturers in estimating their profits have naturally deducted 3 per cent upon the value of the goods sold for "salaries and freight." The commissioner obligingly makes the further deduction of 5 per cent for "selling expenses and loss through bad debts." The manufacturers in estimating their profits had naturally deducted for "new equipments and repairs" an amount equal to 6 per cent upon the capital invested in machinery and tools. The commissioner obligingly makes a further deduction for "depreciation" of an amount equal to 10 per cent upon the capital invested in machinery and tools. By this means the profits are whittled down from 16 per cent, as reported by the manufacturers, to 4 1/4 per cent, as returned by the commissioner. That this report should have been published by the Bureau of the Statistics of Labor shows the direction which has been given to the work of this department. The figures leave no one wiser than before and could have been published only from a desire to help manufacturers by representing that, after all, their business is in a bad way, and that higher wages, shorter hours, and lower tariff are not to be thought of. The department might better be called the "Bureau of the Statistics of Capital."

Mr. Frederick B. Hawley ("American Statistical Association Publications," 1893, vol. iii., p. 38) also severely criticizes the Massachusetts report. He finds many suspicious points in the report, all pointing one way. The great cotton-goods industry is reported as selling at a net loss of 10.91 per cent of the selling price. Says Mr. Hawley:

The cotton-goods industry, like others, has its ups and downs, but I do not believe it ever had as bad a year as this. But if the figures are correct, then it follows that the choice of that year for gathering of the original data was an unfortunate one.

Yet it employed 27.33 per cent of the capital and 11.55 per cent of the whole output of the 10,013 establishments reported, and vitiates the final conclusion, Mr. Hawley calculates, by no less than 64.61.

On the other hand a business man writes to the Statistical Association that, adding together the total dividends of all the larger manufacturing and other companies in Massachusetts which have not changed their capital from 1882 to 1892, he gets \$24,420,913, and he also says that Jan. 1, 1892, their stocks could be bought for \$11,005,913 less than Jan. 1, 1882, and that, deducting this from the dividends, we have \$13,415,446 as the net dividends, which would make only 2.68 per cent a year.

Such contradictory statements as these show the difficulty, if not the impossibility, of making any correct general statements as to net profits. It depends very largely upon what is included under profits. (See PROFIT.) This is true of all industries. It is particularly true of mercantile establishments. Some great stores are said, on good authority, to make 25 per cent profit on their capital; many make little or none, and vast numbers go into bankruptcy. (Of the railroads it is almost as difficult to speak, because of the dif-

ferences of bookkeeping. Many railroads declare small and often no dividends. The inference would seem to be that they are making low net profits or none at all. This, however, by no means necessarily follows. It is true, undoubtedly, of some roads, but of many roads it is simply a matter of bookkeeping. Watered stock accounts for a part of it. Railroads with watered stock try to pay dividends on capital never paid in. (See STOCK-WATERING.) Duplication in accounts explains much. Railroads absorb small roads, and in their accounts the capitalization and bonds of the smaller roads appear both separately and added to the capital of the main road. Salaries and jobs granted to the officers of the road account for much. Sums put down as expenses of maintenance really often mean immense profits for some favored few. Hence, roads nominally making nothing often immensely enrich some of their owners. Undoubtedly, however, the legitimate net profits of many forms of investment are not large. Most of the large fortunes made in industrial investments are made in more or less illegitimate gambling in stocks, the buying and bearing of railroads, or in monopolies, natural or the creatures of the law. (For a discussion of this, see WEALTH.)

It follows from this view that, if social reformers would increase wages, and lower profits, thus equalizing distribution, what they must strive for is not so much the increase of wages in legitimate industry, as for a change in laws and customs allowing of the immense profits made to-day by speculation in natural or artificial monopolies. Most reformers believe, to-day, that a more equitable distribution must come from change of system rather than from mere generosity on the part of employers. That in some way immense net profits are made to-day, the facts of the distribution of wealth, both in England and America, abundantly prove (see WEALTH).

PROFIT-SHARING: This system of industrial remuneration has been defined as "the division of realized profits between the capitalist, the employer, and the employee, in addition to regular interest, salary, and wages"; and it is claimed by its advocates to be "the most equitable and generally satisfactory method of remunerating the three industrial agents."¹

It has also been defined by the International Congress, held in connection with the Paris Exposition in the summer of 1889, as "a voluntary agreement under which the employee receives a share, *fixt* beforehand, in the profits of the business."

Participation of the workmen in the profits of business undertakings is, historically, a method first prominently associated with the name of the Parisian house-painter and decorator, Edme Jean Leclaire (*q. v.*). As a youth he became an apprentice to a house-painter in Paris, and showed himself remarkably diligent in his work. He set up for himself in 1827, and his first great stroke of business was a contract for painting seven houses in 1829, by which he cleared 6,000 francs; he paid his men 5 fr. per day on this job, instead of the usual 4 fr. In 1838 he established a mutual aid society for them, which he found "a powerful means of moralization." But he desired, furthermore, to provide for his men in their old

age, and in case of a change in the ownership of the business. A friend, M. Frégier, told him that he saw no solution to the problem except in the participation of the workmen in the profits of the master. "This was in 1835," writes Leclaire. "My head was too thoroughly crammed with all the ideas of the economists and reformers of the time to relish this proposition. It appeared to me entirely impracticable. I rejected it emphatically." But all at once, five years later, he perceived that he might have made a great mistake in his reasoning. He could not afford to take out from his average profits a sum sufficient to help his workmen much. But would not an industrial partnership "create, by the common effort, in view of the division of profit, and with the energy so called forth," a further return beyond the average, which would not only pay the workman a bonus, but might even increase the profits of the employer? Are there not, in the common workman, moral qualities to which the simple wages system makes slight appeal, because it leaves the inspiring word "profit" out of the workman's vocabulary, with all its implications of ambition, zeal, and persistence? Would not the prospect of a share in the profits of business advance the prosperity of the establishment by increasing the quantity of the product, by improving its quality, by promoting care of implements and machinery, and economy of materials, and by diminishing labor difficulties and the cost of superintendence? Leclaire tried the experiment cautiously, beginning in 1842, after due preparation; and he soon found that all these questions were answered by experience with a decided affirmative.

His workmen, despite his many efforts for their good and his careful preparations for the new scheme, were suspicious at first, but the first bonus changed their feelings. On Feb. 12, 1843, Leclaire distributed to forty-four workmen 12,266 fr. When he was a candidate for the Constituent Assembly, in 1848, he stated in his electoral address that he had distributed in six years 112,588 fr. The number of participants had risen to ninety-eight. "This is what we can do without touching any one's property; this is what I have practised for six years; I have found my profit in it, and others also."

In 1853 Leclaire associated with himself M. Alfred Defournaux, the son of an overseer, who had grown up in the house, and the Mutual Aid Society was reconstituted for a second term of fifteen years, its entire resources to consist of annual donations from the house. In 1860 the time limit was abolished, and retiring pensions established. In 1863 the Mutual Aid Society was incorporated and became a perpetual sleeping partner with limited liability in Leclaire et Cie. Of its accumulated capital, 116,442 fr., 100,000 fr. were invested in the firm at 5 per cent interest. It received 20 per cent of the net profits, while 30 per cent went to the workmen as a bonus calculated on wages. This was the result of twenty-one years' trial of profit-sharing. In 1865 Leclaire withdrew from active business; in 1869 the system was thoroughly revised, and in 1871 a resolution was passed admitting to a share in the profits the apprentices and auxiliary workmen. Henceforth, even a single day's work entitled a transient employee to a share in the bonus. Leclaire died at Herblay, near Paris, in 1872, leaving a fortune of 1,200,000 fr., which he attributed largely to his system of participation.

¹"Profit-Sharing Between Employer and Employee," by N. P. Gilman, p. 412.

The Maison Leclaire is now an elaborate and almost ideal industrial partnership. It has two managing partners and one sleeping partner, the Mutual Aid Society. The society holds half of the capital of 400,000 fr. and each partner a fourth. If, when a new partner is chosen by the men, he has not this amount of capital, the acquisition of it is rendered easy for him. The reserve fund is 100,000 fr. When it falls below this amount a first levy of 10 per cent is to be made upon the profits of the year until it is restored to its normal size. Capital receives 5 per cent interest, and each manager 1,200 fr. as salary for superintendence. After interest, salary for management, and any needed sum for the reserve fund have been taken from the gross profits of the year, the net profit is thus divided: One quarter part goes to the two partners, a second to the society, and the remaining half to the working force in proportion to wages and the number of hours' work done. Between 1870 and 1886 the number of participants varied from 710 to 1,125, the total of wages paid from 406,414 fr. to 1,069,905, the total bonus from 61,625 fr. to 240,050, and the ratio of bonus to wages from 12 to 24 per cent. The liability of the workmen is confined to their interest in the reserve fund, which has never yet been drawn upon to pay losses.

The Maison Leclaire

The *noyau*, or nucleus, is an important feature in the Maison Leclaire. The conditions of membership are five years' service in the house; age between twenty-five and forty; ability to read, write, and cipher; skill in work, and good moral character. The membership is kept at nearly the same figure; the members have a first claim to employment in bad times; it supplies men for vacancies in the clerical force, from which it elects a new partner on occasion. It chooses eight members of the committee of conciliation, the partners being the other two. This committee takes cognizance of any misconduct in the force, and examines candidates for admission. The *noyau* chooses the foreman each year from a list submitted by the managers. Membership in the *noyau* is a condition for admission to the Mutual Aid Society, which is thoroughly organized and generously administered, giving aid in sickness, at death, and in pensions and life-insurance policies. In 1887 its property was 2,053,618 fr.

The workman in the Maison Leclaire receives the highest wages paid in his craft in Paris; a year's bonus varying from 12 to 24 per cent; in case of sickness 5 fr. a day; in case of permanent disability, a pension of 1,200 fr., and he may retire on such a pension after twenty years' service. His sons are preferred as apprentices, and at his death 1,000 fr. of life-insurance are paid to his family and the funeral expenses defrayed. The standard of skill and character corresponds to these exceptional advantages. Peace and good-will reign in the establishment, and its long career of more than sixty years of prosperity has made it the classic instance of profit-sharing elaborately developed.

The profit-sharing firms of France are now some 125 in number. Among the more important cases, for size and length of trial of the system, are the noted Bon Marché of Paris, employing 3,000 persons, and doing a business of \$30,000,000 a year; the immense Chaix printing house of Paris; the great Godin foundries at Guise, with a capital of 6,000,000 fr., and

the Laroche-Joubert paper works at Angoulême, with its thousand employees.

The French Society for the Practical Study of Profit-Sharing, founded in 1879, is a flourishing organization. Membership in the society is confined to business men practising the system.

In Germany and other countries of the Continent the heads of some 70 firms would be eligible to such membership.

In the United States it is a conservative estimate that there are now half a hundred firms practising profit-sharing. No list of such firms has been published since 1891.

United States The manufacturing company the head of which is Mr. N. O. Nelson (*q. v.*), of St. Louis, is, in several ways, the most conspicuous of all American profit-sharing enterprises.

The N. O. Nelson Manufacturing Company, at Edwardsville, Ill., is situated within an hour's ride of St. Louis. In this village, Leclaire (*q. v.*), the building of a home is rendered easy by the Cooperative Building Association and special facilities provided by the company; a large clubhouse is managed by a considerable number of men, who lodge and board in it at a moderate price; all the buildings are provided with water, steam-heat, electric light, good drainage, and nearly every other convenience of a city house; provision for amusements has not been overlooked.

The first year's dividend, paid by the company in 1887, was 5 per cent on wages; the next, 10 per cent; the third, 10 per cent; the fourth, 8 per cent; the fifth, 10 per cent; the sixth, 7 per cent, and the seventh, 4 per cent; making 54 per cent in seven years, or, practically, 8 per cent a year. In 1893 the company succeeded in paying its full force full wages for full time (a nine-hour day), but earned no bonus. The dividends for the first five years were paid in cash, but employees were always at liberty to take it in stock, and about three fourths did so. After having paid the dividends in cash for five years, the company took up the plan of paying only in stock; it has always been a rule to redeem the stock at par, when the holder leaves the company's employ.

Two other cases of profit-sharing in the United States deserving particular attention are the Bourne Cotton-Mills at Fall River, Mass., and the Procter & Gamble Soap Works at Cincinnati. (For a full account of these two cases, and of the Nelson case, see "A Dividend to Labor," part iii.)

The cause of profit-sharing is ably represented in Great Britain by the Labor Copartnership Association. In its monthly paper, *Copartnership*, it states its principles briefly thus, with an indication of the results (issue for Aug., 1907): "Our object is to bring about an organization of industry based on the principle of labor copartnership; that is to say, a system in which all those engaged shall share in the profit, capital, control, and responsibility. With this view we seek (1) in the cooperative movement to aid by propaganda and advice all forms of production based on the above principle. (2) In other businesses to induce employers and employed to adopt schemes of profit-sharing and investment tending in the same direction. This system is no mere dream. Independent of the copartnership steps taken by ordinary businesses, the principle is carried out by British productive businesses,

organized by working men, which, at the end of 1906, numbered 120; had a capital of £1,938,980; sold in the year £3,806,156 worth of goods; made a net profit of £187,501 (after deducting losses); and paid to labor, in addition to provident funds, a sum not easily ascertained, but exceeding £22,308, as labor's share of the results over and above standard wages. In some, the part of labor, whether in profit or in management, is smaller, and in some larger, but in all there is co-partnership."

The number of cases in England where profit-sharing is at present in effect in the "ordinary businesses" just mentioned is 82, according to the latest figures of the Board of Trade. Among these instances of profit-sharing some having special interest are Fox Bros., woolen manufacturers, Wellington, Somerset (now the oldest instance, going back of 1866); J. T. & J. Taylor, of Batley (fourteen years); Hazell, Watson & Viney, printers, of London; Wm. Thomson & Sons, woolens, Huddersfield (twenty years); Clarke, Nicholls & Coombs, of London, confectioners; and Sir W. G. Armstrong, White-worth & Co., the immense engineering works. The most notable development in a particular business, however, is in the manufacture of gas. Here the South Metropolitan Company of London has followed the counsels of Sir George Livesey, the managing director, with the striking result shown in the first line of figures of the following table, which also shows the experience of four other gas companies, influenced by the

companies, is that since 1898 the former has had three workmen directors on its board, chosen by the workmen, and the latter also has had such directors. (The Consolidated Gas Company of Boston, Mass., has recently put into effect a stock-sharing plan like that of these English companies.)

In view of this record a recent utterance of Sir George Livesey, now chairman of the company, may be quoted. At the annual meeting of the Labor Copartnership Association, held Oct. 31, 1906, he moved this resolution:

"That this meeting, recognizing the serious inequalities which abound in the existing social system, affirms its belief in the principle of copartnership, by which labor and capital are united in a common endeavor to produce and distribute wealth in the most efficient manner, and hopes that both employers and employed will give increasing support to an industrial method so well calculated to solve some of our most acute social problems."

He then said he had studied the industrial question very closely since 1889, and he did not think that employers and employed were getting closer together under the present wage system. The remedy, he believed, was to be found in the union of capital and labor in the same hands. Copartnership united capital and labor and also enabled the laborer to become the owner of property. In advocating copartnership as the remedy, he was simply stating what he believed to be the absolute truth. Mere profit-sharing did not in his experience go far enough. The distribution of profits each year in cash did

PARTICULARS OF COPARTNERSHIP AND PROFIT-SHARING IN BRITISH GAS COMPANIES

| NAME OF COMPANY | No. of years scheme has been in operation | Capital in 1906. Total share and loan | No. of employees under agreement for profit-sharing or copartnership | Amount divided among employees for year ending June, 1906 | Amount per cent on wages | Total profit to employees since scheme was adopted | Amount of shares and deposits held by employees in the company. Market value (about) |
|-------------------------|---|---------------------------------------|--|---|--------------------------|--|--|
| South Metropolitan..... | Since 1889 | £ 8,245,445 | about 5,000 | £ 43,962 | 9½ | £ 345,214 | £ 309,000 |
| Commercial..... | Since 1901 | 2,478,280 | 1,236 | 5,742 | 5½ | 23,446 | 30,043 |

example of the South Metropolitan Company. (See the full account of this company's scheme in "A Dividend to Labor," pp. 317-323.)

It will be seen that the total sums credited to the employees under the schemes for the year ending June 30, 1906, was no less than £53,256, while the aggregate amount since the schemes were adopted exceeds £396,478, and the total amount capitalized equals £368,548. It is expected that the total amount standing to the credit of the 7,137 employees in the capital of the companies in two years will be not far short of £500,000. What this great sum, owned by men most of whom before the adoption of these schemes probably never possess a penny after they had paid their debts, means in freedom from anxiety, stimulus to careful habits and forethought, and all that goes to add to happiness and strengthen character, it is difficult to overestimate. On the face of it is clear that not only are the individual workmen the gainers, but, as is the case with all genuine progressive steps, the community gains too. One thing at any rate these schemes show, and that is that labor copartnership is practicable in gas companies, and if these alone throughout the country would take the matter up, as five have already done, the improvement in the lives of some tens of thousands of workmen would be great indeed.

The most striking point about the scheme of the South Metropolitan and the South Suburban

not encourage thrift because often those among whom the profits were divided did not make the best use of them. Copartnership meant that the workers would have a sense of responsibility because as shareholders they would experience the effects of bad times as well as of good. When the South Metropolitan gas scheme was started the share of profits was paid in cash, with the option of investment, but only about 45 per cent of the men invested. In 1894 it was decided that half the amount due should be credited to the men as stock in the company and the balance paid in cash. Now, practically every pound allotted is invested, the men realizing that it is much to their advantage to let their share of profit accumulate. Of the £43,000 allotted to the men last July none had been withdrawn, except that paid to men leaving or in respect of workmen who had died. To-day every man in regular employ was a shareholder, the total amount invested being over £300,000. Copartnership, continued Sir George, increased the workers' self-respect and removed the fear that in

old age they would be in want. To show how the men had benefited he said that eleven of them employed in one department held between them £2,000 in the company, while one man had £400. Sir George referred to the many difficulties that had to be contended with in carrying out the scheme, the men having to be educated up to it step by step, but he did not see why other companies should not put copartnership into operation as his own had done.

Profit-sharing is a conservative movement. It attempts to recall, as far as is possible under

Practicability

the changed conditions of modern industry, the old sentiment of partnership felt when the shoe manufacturer in his small shop worked at the same bench with his few employees, or when the farm was let on shares, or the catch of the fishing schooner was apportioned among the crew. We can no longer divide the actual products of industry among the workers. But we can modify the wage system, and strengthen it at a weak point, by adding to fixed wages a variable bonus, dependent on the workman's zeal. Industrial partnership, again, has this singular advantage over the socialisms of the day, and even over the more sober scheme of productive cooperation: it pays due respect to the two great principles of modern society which must find a *modus vivendi*—democracy and aristocracy. Those who would solve all industrial troubles by a resort to the easy but deceptive analogy of democratic government, and the erection of an "industrial republic," declare that profit-sharing is not a practical reform, that it is unjust to the workman, since the bonus is bestowed as a gift and not as a right, and that, in reality, it intensifies the evils of the wage system by making the workman more dependent on the employer. These objections by Socialists and revolutionary reformers have the character usual in criticism of moderate and statesmanlike measures by theorists. The practicability of the system has been amply proved by many firms in long years of trial. The bonus tends steadily to become a fixed and regular addition to wages, dependent not on the mere will of the employer, but on a written agreement and the results of the year. In its developed and logical form, profit-sharing makes the transition to cooperative production more gradual, easy, and sure than any other method yet devised. Its advocates do not find any objection to it in the fact that the employer often profits by the system as well as the employee, but this fact seems sufficient to stamp the plan as iniquitous in the eyes of so-called reformers who consider that the employer should either lose or, at least, not profit by any change in existing methods. A system advantageous to both parties fails to commend itself to such very partial thinkers! Profit-sharing, on the contrary, starting from the actual state of things, would modify this in the interest of both parties and to the injury of neither; and here is its recommendation to the enlightened employer and the sensible workman.

It is not on the ground of abstract justice or inherent right—these are matters about which it is very easy to be mistaken—but on the ground of ordinary human nature and actual experiment, that the advocate of profit-sharing bases his confidence in its gradual diffusion.

He can now appeal to a large body of experience in favor of his claim that a regular dividend to labor out of profits is one of the next steps which the evolution of industry is likely to follow in numerous quarters. The chief reason why profit-sharing has not made greater progress than the above figures show, is undoubtedly the common opposition of the trade-unions. How far this opposition is justifiable from the standpoint of the general welfare of society we cannot here take room to consider. Profit-sharing is a move by the employer toward industrial peace; if it is not accepted by the workman, the latter should offer, if he can, a system better calculated to advance the interests of both parties.

For details of the history of profit-sharing and its present condition, and a full statement of the argument for it, see "Profit-Sharing Between Employer and Employee," chap. ix. of "Socialism and the American Spirit," and "A Dividend to Labor" (part iii. and appendices), by N. P. Gilman (a bibliography may be found in the first work, continued in the other two volumes); "Profit-Sharing Between Capital and Labor," by Sedley Taylor; "Profit-Sharing and the Labor Question," by T. W. Bushill (an employer); "Sharing the Profits," by Mary W. Calkins; "La Participation aux Bénéfices," the French translation of Dr. Victor Böhmert's work, with additions, revised edition; "Guide Pratique pour l'Application de la Participation aux Bénéfices," par A. Trombert; "Methods of Industrial Remuneration," by D. F. Schloss, third edition; "History of Cooperation in the United States"; the "Bulletin of the French Society"; *Copartnership*, the monthly organ of the Labor Copartnership Association of London, and the annual reports of the Labor Department of the Board of Trade since 1894, usually summarized in the *Labor Gazette* of the department.

N. P. GILMAN.

OBJECTIONS TO PROFIT-SHARING

1. That it is not practical, not being suited to the times. The distinguishing economic characteristic of the present time is a tendency to combination. Firms that will not enter into combines, or are not themselves doing a very large business, are troubled not as to the way in which to share their profits, but as to their inability to make any profits to share. In the best times many firms make no profits. Profit-sharing is scarcely then applicable except to great monopolies and the strongest firms. Of the seven instances in New England cited by Professor Bemis ("Cooperation in New England," by Professor Bemis, in publications of the American Economic Association, Nov., 1886), one, a shoe establishment of Brockton, Mass., was not a case of profit-sharing, but a percentage on capital paid in by workmen; one, the New Haven Wire Company, merely proposed the plan to the employees, which was rejected; and only one of the entire seven had ever paid a dividend. Mr. Paul Monroe states, in the *American Journal of Sociology* for May, 1896, that of 50 cases of profit-sharing only 12 continue. Its friends claim that in many cases of discontinuance the failure was due, not to anything inherent in the system, but to intrinsic causes. This is true and is the most damaging and conclusive testimony against the system. It is not suited to the times. Extrinsic causes

usually prevent its successful operation. Its diagnosis of present evils does not go deep enough. Employers can rarely practise it, and employees care little for it.

2. Even when successful, as it is in a few strong firms, it is of questionable advantage to working men. Unless coupled with other reforms, which are not profit-sharing, it gives the worker no voice in the management. It does not develop the responsibility of the worker. Its advocates claim, indeed, that while it does not do everything it is at least a practical first step to-day toward industrial partnership. This, its critics say, is not the case. In their view it is not a step toward industrial democracy or fraternity. It intensifies paternalism. It says, "If you, the worker, will work a little harder, we, the management, will give you a slight share of your increased earnings." Mr. Monroe (see above) sums up the case as to profit-sharing by declaring it of some importance from a statistical point of view, but little, if any, from that of social progress.

3. Profit-sharing is unjust.

Says a recent writer—we abridge his words:

There is only one party to it, and that is the employer. He proposes it; he decides when a surplus of profits exists, and how much it is; he lays down rules for apportionment and distribution among employees; in a word, he manages the business and the books without any right of interference or question by employees, and from his decision there is no appeal. All these things give profit-sharing the appearance of a gift bestowed, whereas it is a payment earned. It is not legally a gift which must take effect immediately; it is a mere promise without consideration, and cannot be enforced. Wage-workers demand not merely greater wages, which they have already obtained, but a greater proportionate share of products in accordance with the new ethics of social justice. Profit-sharing not only offers no balm for this, the real wound of industrial society, but aggravates the difficulty. Mr. Gilman, in the work above quoted (pp. 415-416), says that employers who have adopted profit-sharing "generally agree that the division of a bonus among the working men is good business policy; . . . in most cases they claim that their own share is greater than the whole profits were under the simple wage system." By what means has their share become "greater"? Through whose efforts are they enriched by extra profits? Says Mr. Gilman: "Out of this extra profit comes the share of men whose diligence and care have created it."

Profit-sharing thus reduces the proportionate share of workmen. If extra profits, or, in other words, more goods, are produced solely by the "diligence and care" of employees, to them should belong the goods. No part of them should go to capital, for this has played no part in creating the surplus; no part should go to the employer, for he has done actually less. Every consideration of justice demands that laborers, who have by increased exertion produced more, should alone have the fruit of their labor. To bestow a part of this on the laborer, and a part on the employer, is what profit-sharing graciously offers to do!

4. Profit-sharing misleads. It has been before the world fifty years. Largely tried, it has to-day only 108 firms in all the United States and Great Britain. Meanwhile the social question is developing a crisis around the world. Society demands deeper remedies than what has accomplished so little in fifty years, and that of doubtful good.

PROGRESS (UNITED STATES): The table on pages 968, 969 is compiled from the monthly summary of the U. S. Bureau of Statistics for March, 1907.

PROHIBITION: The object of Prohibitionists is to obtain laws prohibiting the manufacture and sale of intoxicating liquors, except for the purpose of manufacturing industries, science and art, and medicine. They argue that this is advisable because vast sums of money are annually wasted by the people in the purchase of liquor, and its

consumption reduces the productiveness of labor; because pauperism and crime are largely increased thereby; because the habit of drinking renders the citizen less able to serve in the defense of government, when necessary, or to perform his part in the upbuilding of the nation, and because the government should protect the defenseless women and children, who are most injured by drunkenness. They also urge that the sale of liquor as an organized business is an element of corruption in national life. The opponents of prohibition dispute some of the facts of its advocates; assert that drunkenness is rather the accompaniment than the cause of pauperism and crime, and argue that, in any event, prohibitory laws cannot be enforced, and that some other system will be more effectual in restraining the sale of liquor. They also contend that prohibitory laws infringe the individual liberty of the citizen. On Dec. 5, 1887, the Supreme Court of the United States rendered an important decision, holding that it is within the discretionary police powers of a state to protect public health, safety, and morals, even by the destruction of property, and that the Kansas laws, providing for the destruction, without compensation, of property used in connection with liquor-selling, do not violate the provision in the Fourteenth Amendment to the Constitution, that "no state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the U. S., nor shall any state deprive any person of . . . property, without due process of law." A prohibitory law was passed in Maine in 1846, and in 1851 a more stringent one, including the provision for the seizure and destruction of intoxicating liquors

History

(known as the "Maine Law," and drafted by Neal Dow), was enacted, and has since been in force, except for the years 1856 and 1857. Vermont in 1852, New Hampshire in 1855, and Connecticut in 1854 passed the Maine law. New York enacted a similar law in 1855, but it was promptly declared unconstitutional by the courts on account of the exposure to confiscation of liquors owned prior to its passage. A prohibition law was enacted in Indiana in 1855, but declared unconstitutional, and was repealed in 1858. Illinois also had a nominal prohibition law, 1851-53. Ohio and Michigan, by their constitutions, forbade the passage of a license law. A prohibitory amendment to the constitution of Kansas was ratified by the people in 1890, and this has been enforced by legislation. A similar amendment was passed in Iowa in 1882, and had a large popular majority, but in the next year it was pronounced invalid because of informalities in its passage. In 1884 a prohibitory law was passed by the legislature. Alaska was placed under prohibition in 1887 by executive order of President Cleveland. Rhode Island has at various times had prohibitory statutes in force. North and South Dakota were admitted to the Union in 1890 as prohibition states. The Indian Territory was early placed under prohibition by act of Congress and the prohibitions were added to by legislation of the Indian "nations." Georgia passed a prohibitory statute in 1907, exceedingly stringent and far-reaching in its terms, and Oklahoma, on Sept. 17 of the same year, adopted a constitution containing a prohibitory clause.

Prohibition in Vermont was repealed in 1902 by political agitation. The same thing came to pass in New Hampshire in 1903. Connecticut repealed

the law in 1872. Rhode Island repealed her latest prohibition law in 1889. Iowa nullified the prohibition law by enacting the "mulct law" (to all intents a license law) in 1894. Ohio retains its antilicense constitution, but legalizes the liquor traffic under a "tax." Michigan repealed prohibition in 1875. South Dakota repealed its law in 1896, and Congress voted a license law for Alaska in 1899.

The year 1907 closes with five prohibition states, including the new State of Oklahoma—Maine, Kansas, North Dakota, Georgia, and Oklahoma, and probably Alabama.

It may properly be said here that in spite of all that is alleged to the contrary, prohibitory law has never been a "failure" in any of the states where it has been tried, tho, on account of political corruption, it has frequently lacked much of accomplishing the full results desired. Its repeal, in every case, has been secured by tremendous efforts upon the part of the liquor interests which have resorted to misrepresentation, bribery, intimidation, and frauds of the grossest character.

The year 1907 witnessed a marked revival of the prohibition idea, especially in the South, where already (see article LOCAL PROHIBITION) there is much territory under no-license law. North Carolina, Tennessee, Mississippi, and Alabama are believed to be upon the eve of passing prohibitory laws.

I. What Prohibition Means

Prohibition, the opposite of permission, is not a synonym of annihilation. Those who say, "Prohibition does not prohibit"—a self-contradictory proposition—mean that prohibition does not annihilate. This is manifestly true of all kinds of prohibitions in this world—those of the divine government; of family government, and of civil government alike. Prohibition does not annihilate, not even when it forbids murder, adultery, theft, false witness, and Sunday-work.

Prohibition does not define accomplishment, but only the aim and attitude of government toward wrong. License is a purchased truce—sometimes a surrender; prohibition is a declaration of war. License is an edict of toleration—sometimes a certificate of "good moral character"; prohibition is a proclamation of outlawry. The first requisite of law is justice. A law that sanctions wrong is not law at all, but legislative crime. It is not "public sentiment," but public conscience, out of which law should be quarried. Law is an educator. Dueling, and smuggling, and liquor-selling were once in the "best society." Gradually the law has made them disreputable. Rum-selling under prohibition is a sneaking fugitive, like counterfeiting—not dead, but disgraced, and so shorn of power.

In Maine children grow up without ever seeing a drunken man. In most parts of Kansas and in Iowa, while the prohibition law was in force, the law against the saloon is as effective as the law against the brothel or the burglar. To this fact testify governors, senators, congressmen, pastors, physicians, manufacturers—against whose evidence scarcely a witness can be brought in rebuttal except "anonymous." The liquor-dealer's statement that more liquor is consumed under prohibition than without it is canceled by actions that speak louder than words, by frantic

efforts, at great cost, to defeat prohibition wherever it is proposed.

The argument for prohibition may be concisely stated in four propositions:

1. The business interests of our country demand the suppression of their worst foe—the liquor traffic.

2. The homes of our country demand the suppression of their worst foe—the liquor traffic.

3. The political liberty of our country demands the suppression of its worst foe—the liquor traffic.

4. The conscience of the country demands that the attitude of government toward this foe of business, home, and liberty, as toward other foes of the public good, shall be one of uncompromising hostility.

The prohibiting of the sale of a maddening poison is not a "sumptuary law"—that is, a law against luxury—but rather a law to promote luxury; to give every year to the impoverished families of those who waste their money for drink, in place of it, a billion dollars' worth of pianos, books, pictures, etc.

Prohibition is consistent with liberty in the same way as fire-escapes and quarantines are. A prohibitory liquor law is not aimed at the habits of the drinking-man but at the vicious business of the seller, and therefore is a law for the promotion of commerce, for the protection of labor, for the prevention of cruelty and crime, for the preservation of health and home and liberty.

The capital that is invested in the liquor business, if invested in legitimate forms of trade, would give employment to hundreds of thousands more people than are now employed by it, producing goods that would be demanded if the money spent for drink were turned to the legitimate channels of trade.

Not only life, but liberty itself, is menaced by alcohol. In the words of the *Catholic Review*, "There is nothing fanciful in the assertion that in most of the large cities the saloon-keeping interest has as much representation in the common council as have all other interests combined—that is to say, the minority in numbers, intelligence, and decency governs the majority in most of our large cities." It is this "spoils system" of the saloons that civil-service reformers should strike at, if they would cure political corruption at the root. It is not so much examination of office-seekers as extermination of these office-brokers of the saloon that is needed. Municipal reformers also should learn that it is not by a change in the mayor's office, but by a change in the saloon, that city politics is to be purified. If our city politics is in slavery to the saloons to-day, when the states are able to restrain them by their yeoman majorities in the legislatures, what of the time when the cities shall have the majority of our voters?

Those uses of alcoholic liquors which have been made the excuse for their continued sale, specially their use in medicine, have far less importance now than formerly. The whole trend of medical science is away from the use of alcohol as a medicine. Only a small part of the amount so used a quarter of a century ago is employed to-day. Thousands of successful physicians now never use it at all, and its most ardent advocates use it with care and far less frequently than in the past. In the realm of the arts, denatured alcohol—that is to say, alcohol made unfit for drinking purposes by adding substances having a repelling taste—is now coming into common use.

II. Results of Prohibition

Benefits of Prohibition.—The practical trial of the prohibition policy in the U. S. has been interfered with by many and serious difficulties. Great as is the extent of territory, in the aggregate, where experiments have been made since the agitation began, this policy has never had the advantage of a systematic introduction and broad foundation. The national Congress has never enacted general prohibitory legislation, and has never given support to or even recognized the prohibitory measures adopted in states and localities; indeed, the attitude of the federal government for nearly fifty years has been in formal antagonism to prohibition. The states, with very few exceptions, have uniformly (or with but brief intervals of prohibition) permitted license under certain conditions—conditions that, in practice, have effectually excluded prohibitory law from most of the chief centers of population. Thus, in New England, while two states

(Maine and Vermont) were constantly under complete prohibition for a long term of years; the other four states (Massachusetts, New Hampshire, Connecticut, and Rhode Island), tho nominally prohibiting the traffic at times in that period, have so far inclined to license as to give continuance to liquor manufacture and commerce in such cities as Boston, Portsmouth, New Haven, Hartford, and Providence. Kansas has for years stood alone at the West; meantime the neighboring license states with their great cities have been aggressively hostile to prohibitory laws and diligently sought to flood the prohibition districts with liquor. There is no prohibition state or county, city, village, or township where the success of the policy is not or may not be at any time endangered by the interference of the liquor trade in license states, counties, or localities close at hand.

By a decision of the U. S. Supreme Court no prohibition state can, without the consent of Congress (not yet granted), prevent an interstate railway or express company from carrying to any point within its borders liquor brought from another state.

The chief of the local difficulties undoubtedly arises from the failure of the controlling political parties to earnestly identify themselves with the cause of prohibition. This is not at all equivalent to saying that the people, as the source of parties and of government, are fundamentally responsible in cases of neglect or opposition; for the existence of prohibition implies that popular consent and approval have already been granted. An indifferent or a hostile partizan attitude is frequently, if not always, taken without regard to genuine public sentiment—at least without regard to the sentiment of the best citizens; party action is controlled by designing leaders, and leaders are readily influenced against prohibition by aggressive demands, bribes, threats, and promises of support from the liquor element. Thus it has happened nearly everywhere that prohibition has not enjoyed the cordial political support necessary to its full success. Men personally opposed to prohibition, or deliberately pledged to its organized foes, have been chosen to fill the offices most intimately connected with the administration of law—as judges, prosecuting attorneys, mayors, sheriffs, aldermen, police authorities, etc.; juries have been packed with

saloon adherents—in short, it has often seemed that the entire machinery of government has been given over to the outlawed traffic. Would thoroughly enforced prohibition be beneficial? Are the benefits of partial prohibition such as to justify enacting a prohibitory law that may be only partially effective?

Experience

In sifting the great mass of testimony that every patient inquirer may easily gather, it is difficult to adopt an entirely satisfactory method of classification. For the purposes of this article the testimony will be presented under two heads: (1) Diminution of the Consumption of Drink, and Effects upon Crime and Kindred Evils; (2) Economic and Other Effects.

Nothing is more suggestive than the unanimity and the vigor with which prohibition laws are opposed by all engaged in the liquor traffic. In the uncompromising hostility with which the "trade" meets every attempt to establish prohibition lies a strong indication of prohibition's effectiveness.

Neal Dow, the "Father of the Maine Law," made this declaration: "I think I have seen nearly an acre of punchcoons of West India rum at one time on our wharves, just landed from ships. All this time seven distilleries (in Portland) running day and night! Now I will venture to say that we have not had a punchoon of West India rum imported here in five years—yes, I will say ten years, and there is but one distillery in the state, and that not running, I think; but if it runs it is laid under \$3,000 bonds to sell no spirit except for medicinal or mechanical purposes or for exportation."

These statements are confirmed with the strongest emphasis by well-nigh all the eminent men of Maine. It is impossible in this article to make even a summary of all the important testimony.

Senator William P. Frye in 1890 wrote:

I can remember the time when in the State of Maine there was a grocery store at nearly every four corners in certain portions of the state, whose principal business was in the sale of New England rum; when the jails were crowded and poverty prevailed. To-day the country portions of the state are absolutely free from the sale of liquor; poverty is comparatively unknown, and in some of the counties the jails have been without occupants for years at a time.

The law is not a failure; it has been, on the other hand, a wonderful success.

Senator Eugene Hale in the same year wrote:

Throughout the state generally the prohibitory law has driven out the grog-shop, and while liquor is undoubtedly sold in the larger towns and cities, it is not done in an open way, and the amount of liquor-selling is smaller even in these larger towns and cities than in corresponding places elsewhere. Maine people believe in prohibition because they are everyday witnesses to its good effect.

These letters were published in *The Voice* with the following indorsements:

James G. Blaine: "On the point of the relative amount of the liquors sold at present in Maine and in those states where a system of license prevails, I am sure, from personal knowledge and observation, that the sales are immeasurably less in Maine."

Hannibal Hamlin, U. S. senator from Maine, and formerly vice-president of the U. S.: "I concur in the statements made by Mr. Frye. In the great good produced by the prohibitory liquor law of Maine, no man can doubt who has seen its results. It has been of immense value."

Lot M. Morrill, U. S. senator from Maine: "I have the honor unhesitatingly to concur in the opinions expressed in the foregoing by my colleague, Hon. Mr. Frye."

John Lynch, member of Congress from Maine: "I fully concur in the statement of my colleague, Mr. Frye, in regard to the effect of the enforcement of the liquor law in the State of Maine."

John A. Peters and Eugene Hale, members of Congress from Maine: "We are satisfied that there is much less intemperance in Maine than formerly, and that the result is largely produced by what is termed prohibitory legislation."

Confessedly, of late years, there has been much violation of the law in Maine. The assertion has frequently been made that it cannot be enforced. The election of a Prohibition Party sheriff, Samuel F. Pearson, in Portland, in 1900, answered that assertion, and the law has since been enforced there and in other cities by Republican officials under proper incentives.

In Kansas there has always been a tremendous opposition to the law, and at times the opponents have been in practical possession of the state government. In some of the cities, notably in Kansas City, Leavenworth, Atchison, and Wichita, the law has been openly violated without opposition, for years in succession. Yet the results considering the whole state have amply justified the policy.

In 1880, when prohibition was adopted, Kansas had 4 distilleries and 39 breweries, producing 42,779 gallons of spirits and 32,270 barrels of beer. In 1906, in spite of the reported failure of the law, only 18,800 gallons of spirits (and that an increase of more than 7,000 gallons over 1905) and 29,565 barrels of beer were produced in Kansas, Indian Territory, and Oklahoma together. The figures for Kansas alone are not given by the government. In 1907 the last illegal brewery in Kansas closed up and left the state. A considerable number of U. S. liquor-tax certificates have always been issued in Kansas, but in the greater part of the state liquor is not sold openly.

In 1889, when the law was fairly well enforced, *The Voice* applied to the probate judges of the 106 counties of Kansas for information as to the effects of the law; and, among other questions, the following were asked: "How successfully has prohibition closed the saloons in your part of the state?" and "To what extent, in your judgment, has it diminished drunkenness and the consumption of intoxicants for beverage purposes?" There were replies from ninety-seven counties. Ninety-four of the writers declared positively that there were no open saloons, while the other three made qualified reports. Ninety-two stated that drunkenness and the consumption of drink had been greatly diminished. A majority, in estimating the extent of the diminution, placed it at from 75 to 90 per cent; others said that drunkenness and drink had been "entirely eradicated" in their parts of the state, or "almost totally," or were "too small to estimate," etc.¹

Perhaps the best illustration of the success of the enforcement of the prohibitory law in the State of Kansas has been furnished in the present year (1907) in Kansas City, where the Hon. C. W. Trickett was appointed assistant attorney-general for the purpose of enforcing this law. Kansas City, Kan., lies in close proximity to Kansas City, Mo., so that the problem presented special difficulties. The results are summed up in *The Defender*, New York, on Sept. 26, 1907, and show that by the enforcement of the law Mr. Trickett closed every one of the 256 saloons doing unlawful business in the county when he took office, and that 200 gambling-dens and sixty in-

famous resorts closed with them; that bank deposits increased; that attendance at public schools, by boys and girls, who had been obliged to work while liquor was sold, grew at once; that the expense of prosecuting criminals at once decreased, and crime sank to a minimum, while all kinds of business flourished and the city treasury showed an unprecedented favorable balance. With \$84,000 of unlawful revenue from saloons Kansas City, Kan., was always in debt. Without that revenue and without the expenses caused by the saloons, her municipal finances in 1907 are prosperous. Governor E. W. Hoch, of Kansas, writing of the prohibition revival in that state, in a letter to *The Defender*, on Sept. 16, 1907, says:

The state (Kansas) was never so free from saloons and joints as it is to-day. It was never so prosperous as it is now materially and financially. I do not believe that there are anywhere on earth 1,600,000 people maintaining a higher standard of morals than the 1,600,000 who constitute the population of Kansas, nor do I believe that there are anywhere else on earth a similar number of people enjoying such freedom from pauperism and poverty. We have not only proved the wisdom of the prohibition policy so far as the moral and intellectual interests of the people are concerned, but we have established its wisdom from a financial standpoint.

From July 4, 1884, to and including 1893, Iowa was a prohibition state. During the first four of these years the law was well enforced in the greater part of the state. That it ministered to the welfare and prosperity of the state there is ample evidence. The Hon. Henry Sabine,

superintendent of public instruction in that state, testified of it, "Prohibition has not only emptied our jails, but it has also filled our colleges and schools, and brought prosperity to all our educational interests." In 1885 thirty-eight newspaper editors, from all parts of the state, headed by C. F. Clarkson of the leading Des Moines daily paper, signed the statement that the prohibition law was "as well enforced throughout the state as other laws." In 1899 the Hon. William Larrabee, who had been governor of the state, 1886-90, made a public statement in which he showed the results of enforced prohibition, of its nullification, and of its repeal, in a statement of the prison population of Iowa for twelve years, as follows:

| PROHIBITION YEARS | | | |
|------------------------|-------|-----------|-------|
| 1886..... | 696 | 1888..... | 596 |
| 1887..... | 667 | 1889..... | 574 |
| ANTI-PROHIBITION YEARS | | | |
| 1890..... | 588 | 1892..... | 659 |
| 1891..... | 631 | 1893..... | 727 |
| MULCT LAW YEARS | | | |
| 1894..... | 847 | 1896..... | 1,094 |
| 1895..... | 1,094 | 1897..... | 1,118 |

In his message to the legislature in 1889 Governor Larrabee, speaking of the success of the law, said: "The deposits of the banks show an unprecedented increase, and there are everywhere indications of a healthy growth of legitimate trade."

In existing circumstances the decision of the question whether state prohibition has wholesome practical effects, if executed with tolerable fairness, rests mainly upon the conclusions coming from a thorough study of Maine, Kansas, and Iowa experience; for these are the only states in which there has been anything like an adequate and a prolonged trial of the policy

¹ See *The Voice*, June 13, 1889.

throughout a broad extent of territory embracing considerable cities and peopled by enterprising classes of citizens.

Vermont and New Hampshire.—These two states, since the repeal of their prohibitory laws, mentioned above, have given startling proof of the dissatisfaction of the public with license laws, in the fact that no-license territory has constantly increased until the larger part of both the states is under local prohibition.

North Dakota.—In this state the enforcement of the prohibitory law has been strenuously opposed by railroad interests, influenced by money received for transportation of liquors, yet in many towns, notably in Fargo, the law has proved a great success. Fargo, judged by the tests of prosperity, absence of crime, etc., is immeasurably in advance of the license city, Moorehead, located just across the Red River in Minnesota. (See "Fargo and Moorehead," a leaflet published by the National Temperance Society of New York.)

The year 1907 is specially notable for the appearance of a strong movement to repudiate the constitutionality of any law licensing the sale of liquor. Judge Samuel R. Artman, of Indiana, in a formal decision, declared the license laws of that state unconstitutional, on the ground that the sale of liquor is opposed to those things for which the constitution is established, and is a nuisance per se which the legislature cannot legalize. Judge Artman has been followed by several other circuit court judges in Indiana, and, tho one of the cases, passed upon by the supreme court of that state, has been decided adversely, the movement is by no means checked, and the prohibitionists of Indiana are using every effort to bring the case before the Supreme Court of the U. S. It is freely charged that the supreme court of Indiana was influenced by political necessities in its decision. This movement rests upon the ground taken by the U. S. Supreme Court when it said (*Stone vs. Mississippi*, 102 U. S., 816): "No legislature can bargain away the public health or the public morals. The people themselves cannot do it, much less their servants. Government is organized with a view to their preservation and cannot divest itself of the power to provide for them."

WILLIAM P. F. FERGUSON.

PROHIBITION PARTY, THE: The Prohibition Party was established in 1869. The early efforts (1844-60) to secure the prohibition of the liquor traffic were purely non-partizan. The liquor business had little or no political influence and was without effective organization. In most of the cases where prohibition laws were submitted to the people of a state the submission was in good faith and the vote honestly taken.

It is considered memorable that Rev. Charles F. Deems published at Greensburg, N. C., in 1854, a newspaper urging independent political action by the advocates of prohibition. Only a few numbers of this journal were issued.

In the Civil War (1861-65) all political questions save the supreme questions arising from that conflict were lost sight of. The liquor traffic was given a new footing by the internal revenue legislation. Brought into political prominence and schooled in political arts by its close relations with the federal government, the liquor element gradually asserted itself in politics. No

new prohibitory measure was enacted at the North during the war. Rhode Island's statute was repealed in 1863, other state laws were weakened, and nearly all were flagrantly violated. Soon after the restoration of peace it became evident that the liquor dealers were bent on sweeping away, by political operation, all the prohibitory legislation of the union. In Massachusetts, the most populous of the prohibition states, the liquor forces made an aggressive political canvass in 1867, resulting in the election of a legislature which rescinded the law the next year. In Connecticut, in 1860, an active agitation for repeal was begun. In the same year the National Brewers' Congress (at Chicago, June 5, 1860) adopted the following resolution:

Whereas, The action and influence of the temperance party is in direct opposition to the principles of individual freedom and political equality upon which our American union is founded; therefore

Resolved, That we will use all means to stay the progress of this fanatical party, and to secure our individual rights as citizens, and that we will sustain no candidate, of whatever party, in any election, who is in any way disposed toward the total abstinence cause.

A steadily growing disposition upon the part of political leaders to cater to the wishes and consent to the demands of the liquor interests gradually forced the advocates of prohibition to the position that the interests which they championed could be conserved only by the control of the machinery of government by the advocates of those interests.

In Feb., 1867, the State Temperance Convention of Pennsylvania declared that "if the adversaries of temperance shall continue to receive the aid and countenance of present political parties we shall not hesitate to break over political bands and seek redress through the ballot-box." The Grand Lodge of Good Templars of Pennsylvania, at Pittsburg, June 10, 1860, passed a similar resolution, and the Right Worthy Grand Lodge of Good Templars (the supreme body of the order), in session at Richmond, Ind., May 28, 1868, recommended the formation of a prohibition party.

In 1869 (at Oswego, N. Y.), at a meeting of the Grand Lodge, a conference of those favoring separate political action was held, and the duty of preparing a call for a national convention to organize a national prohibition party was assigned to a committee of five, composed of Rev. John Russell, of Detroit, Mich., Prof. Daniel Wilkins, of Bloomington, Ill., J. A. Spencer, of Cleveland, O., John N. Stearns, of New York, and James Black, of Lancaster, Pa.

The organizing convention met in Farwell Hall, Chicago, on Sept. 1, 1869, with nearly five hundred delegates in attendance. The name Anti-Dramshop Party at first found favor, but the organization was launched as the National Prohibition Party. Articles II. and III. of the platform adopted by this convention set forth the party's position. They read:

2. That the traffic in intoxicating beverages is a dishonor to Christian civilization, inimical to the best interests of society, a political wrong of unequalled enormity, subversive of the ordinary object of government, not capable of being regulated or restrained by any system of license whatever, but imperatively demanding for its suppression effective legal prohibition, both by state and national legislation.

3. That in view of this, and inasmuch as the existing political parties either oppose or ignore this great and paramount question, and absolutely refuse to do anything toward the suppression of the rum traffic, which is robbing the nation of its brightest intellects, destroying internal prosperity, and rapidly undermining its very foundations, we are driven by an

imperative sense of duty to sever our connection with these political parties and organize ourselves into a National Prohibition Party, having for its primary object the entire suppression of the traffic in intoxicating drinks.

The platform denounced "all repudiation of the public debt," pledged "fidelity to the principles of the Declaration of Independence and the federal Constitution" and deemed it "not expedient at present to give prominence to other political issues." The fifth section expressed reliance upon divine aid. From that day to this the party's utterances have always been deeply religious in tone and form.

At the fall elections of 1869 Ohio was the only state returning votes for the Prohibition Party as a distinct organization, 679 being reported from that state. But Maine cast 4,743 and Minnesota 1,061 votes for "Republican Prohibition" candidates.

In 1870 support was received at the polls in six states, as follows: Illinois, 3,712; Massachusetts (lieutenant-governor), 8,692; Michigan, 2,170; New Hampshire, 1,167; New York, 1,459; Ohio, 2,812—total, 20,012. In Massachusetts the Prohibition candidate for governor, Wendell Phillips, indorsed by the Labor Party and Independent Republicans, polled 21,946 votes.

Only a few of the states held elections in 1871. Five returned Prohibition votes: Massachusetts, 6,598; New Hampshire, 314; New York, 1,820; Ohio, 4,084, and Pennsylvania, 3,186—total, 16,002. In New York the party took the name of "Anti-Dramshop."

The first National Nominating Convention was held on Feb. 22, 1872, at Columbus, Ohio. James Black, of Pennsylvania, and John Russell, of Michigan, were unanimously nominated for president and vice-president, respectively.

Besides the prohibition planks there were planks favoring a sound currency, convertible into gold or silver, suffrage irrespective of color or sex, low rates of travel and transportation, direct vote for presidency and vice-presidency, promotion of immigration, transportation, and purity of office. The total vote was only 5,607, only six states having tickets in the field.

The second National Nominating Convention met in Cleveland on May 17, 1876. Green Clay Smith, of Kentucky, was nominated for president, and Gideon T. Stewart, of Ohio, for vice-president. "The National Prohibition Reform Party" was substituted for the old name.

Resources for a canvass were wholly lacking, the contest between the old parties was bitter, Hayes and Tilden being the candidates, and only 9,737 votes were recorded, but they came from eighteen states. A national conference was held in New York in Sept., 1877, and in state elections that year marked progress was shown. Iowa, which had hitherto ignored the movement, cast 10,545 votes, and Massachusetts, 16,354. The politicians of the former state hastened to submit a prohibitory constitutional amendment to counteract the movement.

The third National Nominating Convention met at Cleveland, June 17, 1880. General Neal Dow, of Maine, was nominated for president, and the Rev. H. A. Thompson, of Ohio, for vice-president.

Again no campaign was waged and in only sixteen states did the party appear, receiving a total of 9,678 votes.

In Aug., 1881, a group of temperance leaders, most of whom had not been identified with the prohibition movement, in a meeting at Lake Bluff, near Chicago, decided to secure a reorganization of and a wider support for the party. A call for a national convention to absorb and supersede the Prohibition Party was issued, and the body met in Farwell Hall, Chicago, Aug. 23 and 24, 1882; 341 delegates being present from twenty-two states. The name, the "Prohibition Home Protection Party," was adopted and was more or less readily accepted by prohibition agitators and voters. The state elections of 1881, 1882, and 1883 were encouraging.

The nominating convention of 1884 was called to order at Pittsburg, May 21st. But it was desired by some of the new

leaders, and by many who had not fully made up their minds, to make a final test of the tendencies of the other political parties before entering the field, and this was done.

The platform committees of the two conventions, after listening with scant courtesy to the advocates, ignored their requests. Many who had hoped that the Republican or the Democratic Party would take up the cause in due time, were now convinced

1884 to 1888

of the hostility of both these organizations, and, when the Prohibition convention assembled at Pittsburg, on July 23d, it was evident that a profound impression had been made on the country. Thirty states and territories and the District of Columbia sent 465 accredited delegates. The original name of the party was restored. John P. St. John, who had been governor of Kansas for two terms as a Republican, was nominated for president, and William Daniel, of Maryland, for vice-president. The temperance women were given special representation in the committee, by the selection of Miss Frances E. Willard, of Illinois, and Mrs. Stewart, of Ohio, as members-at-large. Woman suffrage, however, was left to the discretion of the states, and the platform devoted almost entirely to prohibition. John B. Finch was elected national chairman, and held the office until his death, in 1887.

With the presidential campaign of 1884 the National Prohibition Party ceased to be a merely nominal organization, and began its active career.

An event contributing much to the success of the campaign of 1884 was the founding of a new prohibition paper, *The Voice*, in New York City, by Dr. F. K. Funk. This paper was continued until 1907 and was one of the greatest factors of the reform.

Prohibition electoral tickets for St. John and Daniel were in the field in thirty-four states, and a total vote of 150,626 was counted. The great growth of the party created a sensation, which was intensified by the fact that the votes drawn by it from the Republican Party in New York caused the defeat of Blaine and the election of Cleveland. The resentment of the Republican politicians took the form of persecution of Prohibitionists, but the party thrived upon it.

The National Convention of 1888 was held in Indianapolis. General Clinton B. Fisk, of New Jersey, was nominated for president, and John A. Brooks, of Missouri, for vice-president. In spite of much opposition, especially from the South, the platform made a distinct declaration for woman suffrage. A number of other issues were also recognized.

The campaign waged was vigorous, but the excitement created by the tariff issue between the old parties and the failure of the Methodist Church to support

1888-1904

General Fisk, who was a leading member of that body and depended much upon the strong utterances of its conferences, made the vote disappointingly small. However, 249,945 votes were counted, every state excepting South Carolina contributing.

Following the election of 1888 the party propaganda was vigorous in almost all parts of the country and resulted in a large and enthusiastic national convention in Cincinnati in 1892. General John Bidwell, of California, was nominated for president, and J. B. Cranfill, of Texas, for vice-president. In addition to prohibition the platform declared for woman suffrage, currency reform, laws against monopoly, the restriction of emigration, arbitration, just pensions, support of public schools, and suppression of speculation.

Samuel Dickie was continued as chairman of the national committee, and William T. Wardwell, of New York, the treasurer of the Standard Oil Company, became the secretary of the committee.

The currency issue, the question between the advocates of free silver and a gold standard, was much agitated in the Prohibition Party during the years which followed, and as a result the national convention of 1896, which met at Pittsburg on May 27th, attended by 840 delegates representing thirty-nine states, "split" the free-silver advocate mustering 387 out of 814 votes in the test vote on platform. The platform adopted was known as a single-plank platform, making no declaration on any subject except the prohibition issue. Joshua Levering, of Maryland, was nominated for president, and Hale Johnson, of Illinois, for vice-president. The advocates of the free-silver policy, under the leadership of John P. St. John, R. S. Thompson, Helen M. Gougar, L. B. Logan, withdrew from the convention and formed the "National Party," which polled a few votes in the election which followed and disappeared.

The first McKinley-Bryan campaign so centered public attention upon the currency question that the prohibition issue had hardly a hearing. Only a little over 130,000 votes

were cast for the party's candidates—a falling off of one half. The party rallied itself after this blow, and it was evident that the movement was too deep-rooted to be checked by any disaster. In 1899 the leading prohibition paper, then known as *The New Voice*, was purchased by the firm of Dickie & Woolley and removed to Chicago under the direction of John G. Woolley with William P. F. Ferguson as managing editor.

The National Convention of 1900 met in Chicago and nominated John G. Woolley, of Illinois, for president, and Henry B. Metcalf, of Rhode Island, for vice-president. The platform adopted confined itself entirely to the prohibition issue and the relation of that issue to other questions of national importance. The vote was largely increased, almost 210,000 ballots being counted, every state excepting Louisiana, Nevada, and Mississippi returning Prohibition votes.

In the year 1903 began the movement which has since assumed some importance in the election of Prohibitionists to state legislatures. In that year Mr. Stewart, the national chairman, was elected on the straight Prohibition ticket to the legislature of Illinois from a Chicago district. In 1904 three Prohibitionists secured seats in the Illinois legislature, two others being possibly elected but counted out. In 1906 three Prohibitionists were elected to the legislature of Illinois, and three in Minnesota, while some ten other candidates narrowly missed election. Pronounced Prohibitionists were also elected to the legislature, by the aid of other parties, in Massachusetts and Connecticut, while, in New York, Pennsylvania, and West Virginia, Prohibitionists took part in successful fusion movements.

The National Convention of 1904 met at Indianapolis and nominated Silas C. Swallow, of Pennsylvania, for president, and George W. Carroll, of Texas, for vice-president. Dr. Swallow had gained wide public attention by campaigns in the State of Pennsylvania against political corruptionists and had polled a large vote for governor in that state on the Prohibition ticket.

The following is the presidential vote of the Prohibition Party from 1872 to 1904:

The platform, as the latest and as well the broadest official utterance of the Prohibition Party, is worthy of reproduction here.

NATIONAL PROHIBITION PLATFORM, 1904

The Prohibition Party in national convention assembled, at Indianapolis, June 30, 1904, recognizing that the chief end of all government is the establishment of those principles of righteousness and justice which have been revealed to men as the will of the ever-living God, desiring His blessing upon our national life, and believing in the perpetuation of the high ideals of government of the people, by the people, and for the people, established by our fathers, makes the following declaration of principles and purposes:

I. The widely prevailing system of the licensed and legalized sale of alcoholic beverages is so ruinous to individual interests, so inimical to public welfare, so destructive of national wealth, and so subversive of the rights of great masses of our citizenship, that the destruction of the traffic is, and for years has been, the most important question in American politics.

II. We denounce the lack of statesmanship exhibited by the leaders of the Democratic and Republican parties in their refusal to recognize the paramount importance of this question, and the cowardice with which the leaders of these parties have courted the favor of those whose selfish interests are advanced by the continuation and augmentation of the traffic, until to-day the influence of the liquor traffic practically dominates national, state, and local government throughout the nation.

III. We declare the truth, demonstrated by the experience of half a century, that all methods of dealing with the liquor traffic which recognize its right to exist, in any form, under any system of license or tax or regulation, have proved powerless to remove its evils, and useless as checks upon its growth, while the insignificant public revenues which have accrued therefrom have seared the public conscience against a recognition of its iniquity.

IV. We call public attention to the fact, proved by the experience of more than fifty years, that to secure the enactment and enforcement of prohibitory legislation, in which alone lies the hope of the protection of the people from the liquor traf-

fic, it is necessary that the legislative, executive, and judicial branches of government should be in the hands of a political party in harmony with the prohibition principle, and pledged to its embodiment in law, and to the execution of those laws.

V. We pledge the Prohibition Party, wherever given power by the suffrages of the people, to the enactment and enforcement of laws prohibiting and abolishing the manufacture, importation, transportation, and sale of alcoholic beverages.

VI. We declare that there is not only no other issue of equal importance before the American people to-day, but that the so-called issues upon which the Democratic and Republican parties seek to divide the electorate of the country are, in large part, subterfuges under the cover of which they wrangle for the spoils of office.

VII. Recognizing that the intelligent voters of the country may properly ask our attitude upon other questions of public concern, we declare ourselves in favor of:

The impartial enforcement of all law.

The safeguarding of the people's rights by a rigid application of the principles of justice to all combinations and organizations of capital and labor.

The recognition of the fact that the right of suffrage should depend upon the mental and moral qualifications of the citizen.

A more intimate relation between the people and government, by a wise application of the principle of the initiative and referendum.

Such changes in our laws as will place tariff schedules in the hands of an omnipartisan commission.

The application of uniform laws to all our country and dependencies.

The election of United States senators by vote of the people.

The extension and honest administration of the civil service laws.

The safeguarding of every citizen in every place under the government of the people of the U. S., in all the rights guaranteed by the laws and the Constitution.

International arbitration, and we declare that our nation should contribute, in every manner consistent with national dignity, to the permanent establishment of peace between all nations.

The reform of our divorce laws, the final extirpation of polygamy, and the total overthrow of the present shameful system of the illegal sanction of the social evil, with its unspeakable traffic in girls, by the municipal authorities of almost all our cities.

In December, 1904, Charles R. Jones, of Pennsylvania, was elected national chairman.

WILLIAM F. FERGUSON.

PROPORTIONAL REPRESENTATION: No one, who has not analyzed the statistics of political elections, can realize how defective is the electoral machinery of most countries. The late Mr. Thomas Hare, who was known in England as the "Father of Proportional Representation," calculated that no less than two fifths of the voters were wholly unrepresented in Parliament, while in this country Mr. Salem Dutcher, to whom we owe an excellent work on "Proportional Representation," curiously enough found the same proportion of two fifths to be true also for the Fortieth, Forty-first, and Forty-second Congresses of the United States. In Switzerland the statistics for the years 1881, 1884, and 1887 of the elections to the National Council, which corresponds to our House of Representatives, revealed the same unjust state of affairs. Down to the present time the same system goes on producing similar results. As matters now stand in these countries, the powers of government are entrusted to a majority of the majority, who may be a minority of the whole electorate. If, for instance, three fifths of the electors only are represented in a certain legislature, and one half plus one of the representatives, or say two thirds in order to leave a little margin, regulate the character of legislation, then the majority in that legislature, which frames the laws, represents a minority of the electors; for two thirds of three fifths is two fifths, which is less than one half. Mr. Garfield, while still a Congressman, described this unjust feature of our political machinery with characteristic clearness in a speech delivered before the House of Representatives on June 23,

1870. "In my judgment," he said, "it is the weak point in the theory of representative government, as now organized and administered, that a large portion of the voting people are permanently disfranchised. . . . Take my own district as an example; I have never been elected by less than 9,000 majority. Sometimes the majority has exceeded 12,000. There are about 10,000 Democratic voters in my district, and they have been voting there for the last forty years, without any more hope of having a representative on this floor than of having one in the Commons of Great Britain."

Many readers can supply illustrations of similar injustices, either from their own electoral district or from the wider field of national politics. Here are a few recent examples of similar injustice and disproportion:

The congressional delegation elected in Ohio in 1906 contained 16 Republicans and 5 Democrats. According to the actual vote cast, the proportion ought to have been 11 Republicans and 10 Democrats.

In the British parliamentary election of 1906 the Ministerialist groups had 56 per cent of the votes and elected 72 per cent of the members. The Conservatives had 44 per cent of the votes and elected only 28 per cent of the members. So that the huge Ministerialist majority of 256 ought to have been only 68.

The Oregon House of Representatives consists of 60 members. In the election of June, 1906, the vote cast was, in round figures, as follows: Republicans, 54,000; Democrats, 30,000; Socialists, 7,000; Prohibitionists, 5,000. The fair and proper representation for each party would, therefore, have been 34 Republicans, 19 Democrats, 4 Socialists, and 3 Prohibitionists. Yet the actual result was 59 Republicans, 1 Democrat, and no Socialists or Prohibitionists.

Hundreds of similar examples could be given. The present system is unjust to Republicans as well as to Democrats, to Liberals as well as to Conservatives, and most of all to the smaller parties. The system is hopelessly faulty. By mere accident it sometimes approximates fair results as between the two main parties, but between them alone.

Undoubtedly the habit of manipulating the boundaries of electoral districts for party purposes also tends to aggravate these discrepancies. This abuse is called by the Germans *wahlkreisgeometrie*, or the geometry of electoral districts. In the United States it has been nicknamed the *gerrymander* (q. v.).

But even if dishonest electoral districts were never created, there would still remain a high percentage of unrepresented voters. The truth is, the whole system of electing representatives, as now practised the world over, cannot be made to produce accurate results. It is evident that a radical reform is demanded—one which shall make the vote of every elector effective, by applying the principle of proportional representation.

The various systems proposed of proportional representation are all based upon what is known technically as the electoral quota.

Suppose that in an illustrative state 70,000 votes are cast for the election of seven representatives on the proportional principle. Now, if 70,000 can elect seven, then one seventh of

Injustice of Present Methods

70,000, that is, 10,000, ought to be able to elect one. Thus 10,000 is the electoral quota in such a case. Every candidate who obtains 10,000 votes is sure of election; and every party is entitled to one representative for each 10,000 votes. This assumes that all these seven representatives are elected from the one electoral district.

Basis of Proportional Representation

The same principle applies to a meeting of seventy persons who elect a committee of seven. Any ten persons voting together ought to be able to elect one of the committee, and the electoral quota is therefore ten. Any candidate obtaining ten votes is sure of election. If sixty persons are electing a committee of five, then any twelve of them ought to be able to elect one; and so on, whatever the number of electors or of representatives.

The theoretical basis of the electoral quota is, therefore, to divide the number of votes cast by the number of seats to be filled; in other words, to divide all the votes by all the seats. This gives what may be termed "the large quota." But in practise it is found that a smaller quota is sufficient to insure the election of any candidate and there are simple rules for finding such a quota, with which we will not trouble the reader at this stage. Let it suffice to indicate the general principle on which the electoral quota rests.

Then comes the working out of the quota principle in contested elections. This can best be shown by the descriptions of specific systems which follow:

We take first the Hare or Hare-Spence system, as being more explanatory of the proportional principle than any other, and we describe it in a colloquial way:

If you are voting on the Hare-Spence system in a seven-member electoral district, you mark your ballot for seven candidates (or less) in the order of your choice, with the figures 1, 2, 3, 4, 5, 6, 7. The man whom you like best you mark No. 1, the next best No. 2, and so on in rotation. If your vote goes to help the candidate of your first choice to be elected, then it does not count for anybody else. But if the candidate whom you have marked No. 1—your first choice—has enough votes without yours, or has so few votes that he cannot be elected, then your vote goes to the man whom you have marked No. 2. If your No. 2 does not need or cannot use your vote, then it is passed on to No. 3, and so forth.

The Hare or Hare-Spence System

In counting the votes, the first operation in the Hare system is to sort out the ballots into as many compartments as there are candidates, according to the first choice or No. 1 votes, paying no attention for the present to the other figures on the ballots. While this is being done two tally-clerks are keeping tally of the votes. When the total number of votes is thus ascertained, it is divided by seven, which is the number of members to be elected. This gives the "quota" or number of votes required to elect any one man. For instance, if seven members are to be elected and 14,000 votes have been cast, the "quota" will be 2,000.

This is the "large quota." If the more accurate smaller quota of Mr. Droop is used, the process is thus: Divide the 14,000 votes by one more than the seven seats, and add one to the quotient. This gives 1,751 as the electoral quota. Any candidate getting 1,751 votes is sure of election, because if seven candidates get 1,751 votes each, there are not votes enough left to put an eighth candidate on a par with them. Then any one of the candidates who has a quota or more than a quota is declared elected. If he has more than a quota, his surplus ballots are transferred to such of the other candidates as may have been marked No. 2 on the ballots so transferred. If the candidate marked No. 2 on any of these ballots has already been elected, then the ballot goes on to No. 3, and so on.

It never happens that the full number of members required have quotas of first-choice votes; so we then begin at the other end, take the man at the foot of the poll, with the lowest number of votes, declare him "out of the count," and then distribute the whole of his votes among the remaining candidates, according as indicated by the voters themselves, each on his own ballot. This process of elimination is repeated until seven of the candidates either get a

quota or come the nearest to it, and these seven are the elected ones.

From the above it will be seen that there are four chief factors in the Hare system of proportional representation:

1. The multiple electoral district; that is, a district from which several members are elected—not less than five, and more being better, up to the limit of balloting convenience.
2. The single vote; that is, each elector has one vote only which finally counts.
3. The electoral quota.
4. The transfer of votes.

Two or more of these factors are common to all systems of proportional representation.

Hon. William H. Gove (Salem, Mass.) has devised a system on the same general principles as the Hare plan, but greatly simplified. After nomination and before election each candidate publishes, in a certain formal way, a preferential list of those other candidates to whom he directs that any necessary transfers of his votes shall be made; that is, his surplus, if any, or all his votes if he be eliminated. Then at the election each voter marks only one name on his ballot. The counting and the use of an electoral quota are the same as in the Hare system, except that the candidates' lists are

The Gove Plan

used instead of the voters' second or subsequent choices, and actual ballots are not transferred. Transfers are made by calculation only, so that the ballots have not to be brought to one central place for counting.

A simpler plan still is used in Japan. In multiple electoral districts each elector has one vote only. The districts vary in electoral size from five members to fifteen.

The Japanese System

There is no electoral quota, and there are no transfers. The votes are simply counted, and the required number of members taken from the head of the poll. This frequently gives a true proportional result; because the process is just the same as if only the first choices were counted in the Hare system; and often in that system those who head the poll on the count of first choices are those ultimately elected. In any event the only difference the transfers make is a difference of one member, or two at most. The explanation is that the tendency of electoral transfers is from the weaker to the stronger candidates. Therefore the simple single vote in a multiple district is approximately proportional.

An addition to the Japanese system is proposed by Mr. John H. Berry, of Salem, Mass., and has been twice or three times embodied in a bill before the Massachusetts Legislature, but not passed.

The Proxy System

It gives each elected representative as many votes on a division as he has received from his constituents at his election, and provides a simple and ingenious plan by which any voter may transfer his vote from one representative to another, or from an unsuccessful to a successful candidate, thus enabling voters to withdraw support from an unfaithful representative, and insuring that every voter can be represented if he chooses.

A plan called cumulative voting was used for thirty years in the election of English school-boards. It is now in use in the State of Illinois for legislative elections.

Cumulative Voting

In three-member districts—districts too small for really good marking. Each elector has as many votes as there are candidates to be elected, and he may divide these votes among several candidates or "cumulate" them all on one or two of the candidates, as he pleases. The more the voters cumulate, the more proportional is the result. Cumulative voting, used as a system by itself, is an imperfect plan, and leads to great waste of votes. It is used in multiple districts.

Between systems of proportional representation there is a distinct line of cleavage; that between list systems and the non-list methods we have been describing.

The List Systems

A marked feature of list systems is that either the single vote, the multiple vote, or the cumulative vote may be used with them. They all require that the candidates be divided into party lists on the ballots; hence the name. Each list has its appropriate party heading. A vote counts both for the list and for the individuals in it to whom the vote is given.

The process of counting is to ascertain the grand total of votes, and the total for each list. Then the electoral quota is obtained in one of the ways already mentioned, or by mathematical methods such as the d'Hondt plan, which is adapted to list systems only, and gives a smaller quota than even the Droop. Next the lists are divided in turn by the electoral quota, thus showing the number of representatives to which each list is entitled. These representatives are chosen from the candidates having the largest number of votes.

In Switzerland the system is called the free list, and the multiple vote is chiefly used in connection with it; only one canton having the cumulative vote instead. The effect of the multiple vote, so used, is to give proportional results as

between parties, but not as between members of the same party.

In Belgium the single vote is used with the lists, each elector having one vote only; but the nominating arrangements are such as to give great power to the party organizations.

Akin to proportional representation is the preferential plan of securing an absolute majority at one balloting when electing a single officer such as a governor or mayor, no matter how many candidates are running. There is also the great advantage of promoting free nomination of candidates because a weak candidate can be nominated without fear of cutting into the vote of a stronger candidate in the same interest. The method is simply that of the Hare or Gove system without the electoral quota. The counting finally concentrates the whole vote on two of the candidates, one of whom must then have a clear majority; barring a tie, which then is dealt with in the ordinary way. When at the same election both single officers and representatives have to be chosen, it is an advantage to use a similar method of balloting for each kind of election.

The Absolute Majority Method

Turning now to the actual use of proportional representation in legislative elections, we have the example of Switzerland, Belgium, Denmark, Tasmania, Japan, and Finland.

Switzerland uses the free list with multiple vote, Canton Zug having the additional feature of cumulation.

A Swiss canton is the equivalent of an American state or a Canadian province. Six cantons elect their legislatures by proportional representation, namely, Ticino, Neuchâtel, Geneva, Zug, Basel, and Soleure. Besides this, the people of Soleure elect the tax commission proportionally; also all municipal councils which consist of more than seven members. When the number is less than seven, the proportional method of election ceases to be obligatory and becomes optional. In Canton Freiburg there is the option of electing municipal councils proportionally. Canton Bern and Canton Ticino also use proportional representation municipally; this including the large capital city of Bern. Recent news is that the canton of Schwyz has voted for the adoption of proportional representation by a good majority.

Belgium uses the free list with the single vote and elects both houses of Parliament on that system, which was first used in the general elections of May, 1900. There have since been general elections in 1902, 1904, and 1906, all on the same proportional plan.

The Kingdom of Denmark has used a modified Hare system in the elections to the Upper House for the last fifty years; also in the election of parliamentary committees. In this case the application of the proportional principle is restricted and partial.

The British colony of Tasmania used the Hare system in Jan., 1897, and again in March, 1900, in the cities of Hobart and Launceston respectively, for the election of members of the island legislature. Six were elected in Hobart and four in Launceston. After the formation of the Australian Commonwealth, the then new state of Tasmania elected her six commonwealth senators and five representatives by the same Hare system. Then interested politicians brought about an indirect abolition of the system, by doing away with the large electoral districts in which alone it could be worked. The government responsible for this was overwhelmingly defeated at the next general election, and the new government reenacted proportional representation, their bill passing the Lower House of the legislature almost unanimously. But the Up-

per House defeated the measure by a majority of two, and there the matter stands for the present. This Tasmanian Upper House is a monopolistic and reactionary institution, small in numbers, and elected for long terms on a restricted franchise.

Japan's Parliament or "Diet" consists of two chambers, the House of Peers and the House of Commons. There are 379 members in the House of Commons, elected from forty-seven electoral districts, thus averaging eight members to a district. The number of members elected from these districts varies from five to fifteen. In every district each elector has one vote only, which gives an exceedingly simple electoral system, with a close approximation to proportional representation in its results.

Finland's new constitution contains a provision for proportional representation, and the system was used for the first time in the 1907 legislative elections of that interesting Russian dependency.

The results of all these various and widely differing practical tests may be shortly summarized in the one word, success.

We will take Belgium as an example, because it is there that proportional representation has been tried on the largest scale, in a country where exact data are available. The information given here comes from "La Représentation Proportionnelle en Belgique," a book published by the distinguished statesman and author, M. le Comte Goblet d'Alviella. We choose the election of 1900 instead of later ones, because, being the first election under proportional representation, the contrast between the new and old systems can be better shown:

Actual Results in Belgium

In the general elections for the Belgian Parliament at the end of May, 1900, a million and a half voters cast their ballots under the free-list plan of proportional representation. There are three parties in Belgium—the Clerical Conservatives, the Liberals, and the Socialists. The Clerical Conservatives prefer to be called simply the Catholic Party. At the previous election under the old system, the Catholics were grossly over-represented, chiefly at the expense of the Liberals; but the new system set this nearly right, and had the effect of giving each party a fairly proportional representation in accordance with the numerical strength of each, thus proving its right to the name it bears. The figures for the Chamber of Deputies (the Lower House) are worth giving.

The defunct Chamber, elected under the old system, contained 112 Catholics, 12 Liberals, and 28 Socialists. In 1900, on May 27th, proportional representation elected 86 Catholics, 33 Liberals, 32 Socialists, and 1 "Democratic Christian"—a dissident from the Catholic Party. This striking difference is indeed an object lesson.

One noteworthy result of the new system has been a great lessening of partizan virulence, largely because each party realized that the system prevented unfair advantage being taken. Another beneficial effect is stated by Count d'Alviella as follows:

"One of the advantages of our proportional representation consists in having broken the old lines that divided in politics our Walloon and our Flemish citizens. Formerly the Walloon districts returned Socialist and Liberal members; the Flemish without exception only Clericals, or Catholics, as they prefer to call themselves. Now, of course, each district has members belonging to both parties, or even to three; and this tends to diminish racial antagonism.

"Another result has been to awaken political life in numerous districts where for a long time it had seemed to be extinguished, especially in the Flemish provinces. In the heart of the two Flanders, notably at Anvers and even at Limbourg, liberal associations have been born or revived in localities most devoted to the conservative Catholic Party. The Socialists entered into the struggle wherever they could find candidates, and the Catholics raised their flag in districts in the Walloon country where they had never succeeded in electing a candidate within the memory of man.

"Among other indirect advantages, proportional representation has thus put an end to the perilous coincidence which tended to establish itself between political divisions

and racial or linguistic divisions. (In Belgium there are two distinct races, speaking different languages.) The Flemish Liberals have to-day in the Chamber of Deputies members who know their country and speak their language; just as the Catholics of the industrial districts find other representatives of their interests than "Luxembourgeois"—country squires, or Flemish proprietors."

The system used in Belgium promotes the solidarity of the great political parties. Count d'Alviella says: "These elections show that Belgium has room for three parties, but only for three. Even in the city of Brussels, which was one large constituency, returning eighteen members, so that to carry a seat less than one eighteenth of the votes cast was required, the lists of the commercials, of the industrial commercials, and of the P. O. L. obtained with difficulty some thousands of votes; but further, neither the independents, in spite of the personal influence of M. Theodor, nor the Christian Democrats, in spite of the intense propaganda of Abbe Daens, succeeded in reaching the electoral quotient which gives a seat. Except the one follower of Abbe Daens elected at Alost, not a dissident has entered either the Chamber or the Senate. The three parties are certainly more homogeneous than they were in the last Parliament elected under the old system."

"On the other hand, proportional representation has put an end to the heterogeneous coalitions which have tended for some years to be introduced into Belgian politics, and which end in reciprocal disappointments. Everywhere the radicals, who generally form the mainspring of anticlerical combinations, have had to resign themselves to go with the moderate Liberals or to struggle alone. At Brussels the independents have been constrained to break with the Catholics, and thus is terminated an equivocal alliance which had monopolized for fourteen years the 'representation' of the district. Each party, freed from the care of seeking at any price allies which it hoped to dupe on the morrow, has been able to present itself with an integral and homogeneous program which, for the first time, perhaps, in an electoral contest, was distinguished for clearness and sincerity."

Coming now to the prospects, progress, and propaganda of the proportional-representation movement in countries other than those mentioned, we find pending legislation or an active propaganda in at least five countries, namely: Sweden, France, Australia, England, and the United States.

The American Proportional Representation League was organized in 1893 (*q. v.*).

The recent work of the American Proportional Representation League has been to collect and distribute information to inquirers and others as to the principles and progress of the movement, particularly among workers for direct legislation, who are to-day among those most interested in political and electoral reform. One result of this policy is a local campaign for the adoption of proportional representation in Oregon, where the old system has had a particularly obnoxious outcome.

The American Proportional Representation League now consists of something over a hundred members, and keeps quietly, but steadily, at work.

A Proportional Representation Society has existed in England for many years, but was almost dormant from 1888 until March, 1905, when a reorganization took place,

with Lord Avebury as president, Hon. Leonard Courtney (now Lord Courtney) as chairman of committee, and Mr. John Humphreys (107 Algernon Road, Lewisham, S. E. London, England) as honorary secretary. Since then much active work has been done. Articles have been published in many newspapers, pamphlets printed and distributed, two bills introduced into the imperial parliament, and a Blue Book of authoritative information issued by the House of Lords, concerning the use of proportional representation in various countries.

In Great Britain the only system proposed is that of Mr. Hare, as modified by Miss C. H. Spence, by introducing the feature of electoral

districts instead of the whole of the country being one district as Mr. Hare proposed. Hence the method is sometimes known as the Hare-Spence system. Altho approved in England, a densely populated country, many members of the American League believe that the Hare system would not work well in the U. S.

South Australia is the home of Miss Catherine Helen Spence, an able advocate of electoral reform; now over eighty-one year of age, but still active as a journalist and public speaker. For some years proportional representation has been in practical politics in that state, but so far without actual adoption. Its prospects seem bright for the near future.

In Victoria attempts have been made to introduce the proportional principle, but so far unsuccessfully. Professor Nanson, professor of mathematics in the University of Melbourne, is leader of the movement in that state.

Tasmania has been already referred to. Some propaganda work has been done in New South Wales.

There is now before the commonwealth Parliament a government bill for the use of preferential voting in single member districts. The Hare-Spence system is the only plan of proportional representation advocated or used in Australia. France during the last few years has been much stirred by the example of her near neighbor, Belgium, and a strong movement for proportional representation is in progress. The organ of the movement is *Le Proportionnaliste*, a quarterly journal published at 71 Grande-Rue Roubaix, France; and it has the support of powerful daily newspapers.

At the general election in May (1907) proportional representation figured in the program of many candidates, and, as soon as the new Parliament was opened, three bills tending to establish it in municipal and parliamentary elections were introduced.

As a result of the long struggle for electoral reform in Sweden the Swedish Government introduced into Parliament in Jan., 1907, a comprehensive measure which includes provisions for proportional voting in the elections for both chambers of the Riksdag and for municipalities.

PROSTITUTION OR THE SOCIAL EVIL: The "social evil," as one form of social wrongdoing is commonly denominated, is not an evil peculiar to any age, country, or civilization. Herodotus tells us of an extent and infamy of prostitution in ancient Babylon almost beyond belief. Prostitution in terrible and unnatural forms was a part of the religious cultus of goddesses or gods worshiped under different names in Phoenicia, Syria, Phrygia, Egypt, and the ad-

Progress and
Propaganda

Great Britain

jacent countries. Similar rites entered into the idolatry which repeatedly led the children of Israel astray, and are connected with the "groves" and "pillars," and other terms under which the English Old Testament covers the literal meaning of the Hebrew original. In Greece and at Athens, as well as in Corinth, we find the same sexual worship and prostitution made a matter of civic glory and religious gain. Unnatural vice was openly practised and defended by Greece's sages, heroes, and statesmen. Prostitution was taught as an art. The most educated women of Greece were courtezans. In Rome, if vice was less beautiful, it was more unbridled. Women of the highest rank, even of the imperial purple, enrolled themselves as common prostitutes. Orgies took place in the baths and in the temples. Obscenity ruled the stage.

We find the evil in every portion of the globe; in India, in Japan, in Hawaii, and everywhere about in proportion to our knowledge of the life of the age and country. We find it in the Middle Ages alike in hovel and in palace; in cloister and in hall. If under the Puritan régime it was temporarily restrained, it broke out in the Restoration in a wilder carnival of vice. (See CRIME.) It exists to-day in modern Babylons as in the old; if it is now publicly condemned and the number of the pure is enormously increased, there are those who believe that it is eating to-day under the surface far more than is generally known. At the National Purity Congress in Baltimore (Oct., 1895) it was stated that the number of prostitutes in the United States was 230,000, and that this implied at least 1,150,000 prostitute-men, which is probably far under the truth. Miss Kate R. O'Hare, a rescue mission worker of many years' experience, estimates (*The Worker*, May 26, 1906) 600,000 public prostitutes in the U. S., and possibly as many more who sacrifice their chastity in connection with some other means of livelihood. Prostitutes are mainly found in the cities. Their male companions live not only in the cities, but also in the towns and villages, whose residents go to the cities for business, or pleasure, or both.

In a paper prepared for the World's Congress on Social Purity, held in Chicago in June, 1903,

Extent

Hon. Elbridge T. Gerry states that Superintendent Byrnes, of the police department, and himself compared notes with exactly the same result, and, viewing the matter from two different standpoints, they were agreed that the number of prostitutes at that time in New York City was at least 40,000.

Some think this estimate was too high. The Rev. F. M. Goodchild, writing in *The Arena* for March, 1896, says:

It has been declared that in New York City there are between 40,000 and 50,000 such women. That would make one habitual prostitute for every nine mature men in the city. As it is estimated that every fallen woman means on an average five fallen men to support her, it would appear that more than half our men are regular contributors to the brothel, which I should hesitate very much to believe.

Mr. Goodchild, however, appears to forget that prostitutes in a city are not supported by residents of that city alone, so that there may be 40,000. Nor is there any reason for believing that New York is much, if any, worse than other places in proportion to their size.

Mr. George K. Turner (*McClure's*, April, 1907)

estimates that \$20,000,000 a year is made by prostitution in Chicago. He says:

There are at least 10,000 professional prostitutes. Average annual receipts of \$2,000 each are brought in by these women. They do not themselves, however, have the benefit of this revenue. Much of it is never received by them. They are, in fact, exploited by large business interests.

There are four large interests which are concerned in the exploitation of prostitution. The first of these is the criminal hotels, the second is the houses of ill fame, the third the cheap dance-halls and saloons, and the fourth the men—largely Russian Jews—who deal in women for the trade. There are large indirect interests—such as, for instance, the leasing or subletting of tenements to the business, an operation which yields enormous percentages of profit—but these are the four principal direct interests in the trade.

He states that 292 hotels interested in prostitution are known and recorded, with 10,000 rooms, and receipts of not less than \$8,000,000 annually, probably \$10,000,000. They are, however, now being proceeded against. The number of good-sized houses of prostitution he puts at 350, with more than 4,000 women. The annual gross receipts are not less than \$8,000,000; they are more likely over \$10,000,000. These houses are disposed throughout the city. Their profits are not only from their shares in the women's wages, but from excessive prices for liquor. They also secure large returns from furnishing clothing and other necessities of life to their employees, at prices ranging from 100 to 300 per cent higher than the usual retail price. By this system the wages of the women are largely secured by the proprietors of the establishments. The plan is not different in principle from the familiar "company store" system of the manufacturing and mining district. It is a first rule of the business, as generally conducted, to keep the employees continuously in debt, so that they are unable to leave the establishments unless the proprietors desire it.

The business of the small places, the flats, cannot be estimated, but it is very large and is growing constantly, especially since the official attacks which have frightened away custom from the criminal hotels. There are certainly not less than 2,000 women in these flats, and annual expenditures are certainly not less than \$4,000,000. In some sections of the city there are scores of these small places. One building of over seventy apartments is said to contain nothing else.

These places and the hotels cater to the demand for ruining young girls—especially the low-paid employees of department stores and factories, which furnish the majority of the English-speaking women in the profession in Chicago. The dance-halls and irregular saloons also take a part of the profit from this source. The direct business of supplying women to the trade, while not so large as these others, is also profitable. Some of the more enterprising of the keepers of the regular houses of ill fame have private arrangements with men, who ruin young girls for their use. Most of the young women who come into the business in this way do so before reaching the age of nineteen.

The largest regular business in furnishing women, however, is done by a company of men, largely composed of Russian Jews, who supply women of that nationality to the trade. These men have a sort of loosely organized association extending through the large cities of the country, their chief centers being New York, Boston, Chicago, and New Orleans. . . . The price paid is about \$50 a head. In some exceptional cases \$75 has been given. This money paid over to the agent is charged up to the debt of the woman to the house. She pays that for her own sale. In addition she gives over a large share of her earnings to the man who places her.

In New York City prostitution is perhaps less open than in Chicago, but the social evil has probably also been more widely spread through all classes of society, from the very wealthy to the very poor. Recently there has been much agitation against it and its more open forms much reduced. According to the report, however, of "The Committee of Fifteen" (1902), in one police precinct, not more than a mile square, there were known to be in 1900 forty houses of prostitution, besides sixty well-known centers of prostitution in tenement-houses.

The Raines Law, requiring saloons to become "hotels," has given opportunity and a cloak of attractiveness and ease to prostitution. The appearance of the "cadet" (who makes money by seducing girls and placing them in houses of prostitution, and receiving from them \$40 or \$50 per week) is but one link between the tenements and

the evil trade. The partnership between some of the police department and the keepers of evil houses has given immunity from arrest in exchange for a share in the profits. Says the report: "When a house containing not more than ten inmates, exclusive of the proprietress, and known as a 'fifty-cent house,' could afford to pay an initiation fee of \$500 to the wardman and \$50 a month for the privilege of continuing in this illegal occupation unmolested, an estimate can be formed as to the amount of trade which must be carried on within."

Of Philadelphia Mr. Goodchild writes (see above):

There are not less than 1,000 houses of ill fame in the city, and as many as 5,000 women live among us by the sale of their bodies. I wish I might have confidence that the estimate is too high; but nearly six years of observation make me fear that the figures are much too low. This does not include, of course, the vast multitude of poor girls whose labor yields scarcely enough to keep body and soul together, many of whom fall victims to the lecherous men who are always on the watch for "new cases."

In many cities like Boston, where there is perhaps less prostitution, there is much evil in society. A responsible reform worker in that city points out a fashionable avenue almost lined with the apartments of the kept mistresses of business men.

But the older cities of Europe are probably even worse. General Booth of the Salvation Army in his "Darkest England" chart estimates the number of prostitutes in London at 30,000.

They have, however, also been put at 10,000. The fact is that no one knows the number of prostitutes in any city. Certainly so far as street solicitation goes, police regulation has of late years much reduced the evil in London, while the fact that any private citizen can set in motion the severe laws against houses of prostitution and their owners has broken up very many such houses, and most of the centers where formerly they multiplied. The believers of the English system of depending on such measures to reduce the evil, and of not attempting medical or legal supervision as on the Continent, point to these successes and prove the decrease of syphilis in the army of Great Britain (not in the empire, in parts of which, as India, conditions are very different).

It must be remembered, however, that London is a world center and that all its evils are not due to local conditions. Critics, therefore, of the English system, in Germany especially, claim that the English system does not work.

A German authority says: "In no country of the world does prostitution assume such a cynical character as in England. In no

Great Britain

country do so many children become its victims as in England; in no country does traffic in girls, especially that of minors, flourish as in England. London is the center for the traffic in girls, the central point for men trading in girls and of their agents. The London houses of ill fame maintain agents of both sexes in every country of Europe, who furnish them with fresh 'goods.' Numberless girls who are enticed to go to England as seamstresses, milliners, servants, governesses, etc., lose their maidenhood in London resorts of ill fame." (See "Freiheit oder gesundheitliche Ueberwachung der Gewerbsunzucht," by Gaston Vorberg, M.D., 1907, p. 43.) This authority goes on to say that some keepers of houses maintain from six to ten houses, and that stock

companies have been formed for this purpose, the under different names. One of them is said to have a capital of £100,000, and divided £56,389 as profit after the first year. It states as its purpose "the better exploitation of real estate of little value." The company has 128 houses, the rent of which would under ordinary circumstances amount to only £40-£50. Each house has ten girls, of whom each yields a net profit of 5s. per diem. The managers, generally women, are entitled to 25 per cent of the income, and are pensioned after ten years.

In Berlin a commission appointed by the Society of Medicine, with Professor Virchow as president, found 4,364 prostitutes in that city recognized by the police, and estimated the total number at from 40,000 to 50,000. ("Addresses of National Purity Congress," 1895, Baltimore, pp. 250-252.) The prefect of police of Paris is quoted as saying that there were in Paris over 100,000. ("Addresses," as above, p. 310.)

Germany has a strict system of supervision by means of registration, and of these statistics can be given. The number of registered prostitutes

in 1900 in cities with a population in 1897-98 was: Berlin, 4,500 with a population of 1,677,304; Breslau,

1,021 with 373,169; Dresden, 250

with 336,440; Hamburg, 733 with 625,552; Cologne, 500 with 321,564; Leipsic, 294 with 399,963; Munich, 60 with 409,307. The number of

these women is stated to have decreased since 1900, because a law went into effect that year which enabled the police to send all prostitutes under eighteen years to an institution, and a large number of those between eighteen and twenty-one. The number of non-registered prostitutes is estimated to be about three times that of the registered, and that of mistresses, considerably higher. The registered girls are visited regularly by physicians, about twice a week in some places, and sent to the hospitals for free treatment, where they are retained until cured.

The houses of assignation in Paris have decreased more than 66 per cent since 1872. In that year the city had 138 houses with 1,092 inmates; in 1907, 41 with 390. This

France

change does not, however, of necessity indicate an increase in morality, but simply one of fashion. The registered houses are no longer allowed to admit girls under twenty-one years of age, since experience has proved that if girls can be tided over to that year, they are less susceptible to temptation; statistics show that only 25 per cent have fallen after their twenty-first year. The registered women are visited weekly by a physician, but must report at once if they are ill. The hospital of St. Lazare furnishes free treatment. Owing to this close supervision, syphilis has largely decreased among the inmates, i. e., from 23.9 per cent in 1872 to practically nil in 1906, perhaps because the diseased women go to the provinces for treatment. In 1904 Dr. Hennequin made confidential inquiries in behalf of the Ministry of the Interior among the mayors of the larger cities. Out of eighty-seven answers, seventy-four were in favor of supervised bordels.

All courtzans who live alone must submit to a physical examination twice a month, and have to show their card of health, if requested. Their number has increased in proportion to the decrease of those in houses, i. e., from 2,583 in 1872

to 5,776 in 1906. Syphilis among them has been reduced greatly, from 20 per cent in 1872 to about 4 in 1906.

The secret or unregistered women who solicit in the streets are examined only when arrested; they do not seek medical aid, altho it is furnished free to them, and thus cause infection. Their number has changed little since 1872, i. e., from 2,498 to 2,265 in 1906; but an average of 25 per cent are treated for syphilis. The number of those who solicit in secret is, of course, considerably larger. Among the alarming facts as to these is, that most of them are minors, e. g., from 1878-87 the police caught 12,615 minors; in 1904 alone, 2,439. They are most susceptible to syphilis, and very dangerous to the public health. The number of other women who have "friends" or supplement their scanty earnings for a compensation of one kind or another, is estimated variously from 50,000 to 100,000.

Other cities in Europe have in the main copied the systems of Paris or Berlin, tho of recent years there has been a decided tendency to abolish the supervision of prostitution owing to the steady protest and agitation of the critics of the system, and the organization

Other Cities

of societies to work for its abolition.

French cities, however, in the main have followed Paris, and in smaller cities it is usually somewhat easier to enforce effective regulations. German cities as a rule regulate vice. Hungary is said to have an efficient system, Austria a less efficient one. Belgium has in the main copied Paris. The larger Italian cities, down to 1888, copied Brussels. In 1888 the law of supervision was abolished, under Crispi, and an increase of venereal diseases in the army is said to have taken place in one year from 4.25 per cent to 10.25 per cent. The Scandinavian cities usually control vice, tho Norway abolished the system in 1888, and Denmark in 1906. Russia demands the registration of both houses and prostitutes. Switzerland is divided, some cantons still maintaining supervision, others abandoning it.

Of the evils connected with prostitution there is scarcely need to speak. Many careful students are coming to believe that the sexual evil, in its various forms, is greater even than that of intemperance. Says Prof. A. G. Warner ("American Charities," p. 66): "Careful observers believe it to be a more constant and fundamental cause of degeneration than intemperance. It certainly effects degeneration of a more or less pronounced type in a much larger number of persons. It persists almost to the end in the most degenerate stock, while at the same time it is operative among the healthier classes. . . . Intemperance is, however, all but universally the companion of prostitution. It has been frequently said that girls rarely can, and men rarely do, continue a fast life without drink. If the saloon is often literally the entrance to a brothel, the brothel as frequently leads to the saloon. An eminent lawyer is quoted on p. 121 of the published "Addresses of the National Purity Congress" at Baltimore (1895) as saying: "It is my deliberate conviction, based upon facts coming to my knowledge in the course of twenty years' practise, that more boys are converted to drinking habits in houses of ill fame than in the saloons."

Amount of Evil

Of the physical evils attendant upon prostitution, perhaps more than enough has been said.

Yet an evil that at any time may, and repeatedly does, reduce youth to premature, helpless old age; transform the body into a rotten shell; affect not only the sinner, but his posterity; make the kiss of love the means of carrying contagion and foul disease to pure brides and innocent children, it is difficult to describe too strongly.

One of the most atrocious evils connected with prostitution are the abominations of child prostitution. Says the Hon. E. T. Gerry ("Addresses," as above, p. 340):

Few have the remotest idea of the extent to which sexual vice exists among children at the present time. I use the word "sexual vice" as including both self-abuse and prostitution. . . . Nothing but the vigilance of parents and guardians can detect the solitary vice, and hence statistics are very difficult to obtain, excepting when the one vice leads up to the other. But in the other case, the figures show a frightful prevalence, at the present time, of juvenile prostitution. True, under the stringent laws which have been enacted in the various states of our union, at the instance of Societies for the Prevention of Cruelty to Children, those who utilize little children for the simple gratification of lust are made to suffer a felon's imprisonment, and while the effect has been to practically denude the brothels of youthful victims, still the vice exists, more especially among the lower classes, to a degree hardly credible in this civilized country. A large number of the brothels, at the present time, are replenished by juvenile prostitutes, rather than by those who have fallen but once. . . . That the disease is spreading is unquestioned.

In a paper on the subject of "Child Prostitution," read at the World's Social Purity Congress in Chicago in 1893, Mr. Gerry states that there is a fearful theory existing in this country, tho more particularly among foreigners, according to which, if any male who has contracted disease through indulgence, can secure a perfectly pure child as his victim, the disease will pass from him to the child. Nor is it only among the poor that these grosser evils exist. If one is to credit the sad whispers of grave officials of the Church as to the morals in boy choirs, or in private and public schools, one finds fearful evidence of the existence, in all ranks of society, of various forms of unnatural vice.

Akin to this evil is that of the organized traffic in girls, which is declared by all who have investigated the subject to be carried on around the world. A few years ago it was stated to the House committee which was investigating the immigrant question in New York, by the president of the Woman's National Industrial League, that "syndicates exist in New York and Boston, for the purpose of supplying fresh young girls from immigrants arriving in this country, for houses of ill fame; agents of the business go abroad and assist in this nefarious business. Immigrants arriving in New York furnish 20,000 victims annually." Much, however, is now done to protect immigrants and traveling girls. Yet the evil is still real. In very many cities agents of houses of ill fame meet girls coming to the cities on the railroads and on the boats. They advertise for girls wanted for light work and good pay. When the girls come they are detained. Agents go out to solicit boys and men as patrons.

Traffic in Girls

A book, "The Traffic in Girls and Florence Crittenton Missions," exposes many of the traps laid for unwary girls. The schools, private as well as public, are often made the main place for promoting child prostitution, disseminating obscene literature, and obtaining fresh victims.

Mrs. Charlton Edholm said at the Baltimore Congresses ("Addresses," p. 153): "I stand here in the presence of God, to say that of the 230,000 erring girls in this land, three fourths of them have been snared and trapped, and bought and sold."

When one realizes that the average life of a

prostitute is said to be but five years, one can understand what a traffic it must be to obtain the 230,000 for the U. S. alone, while alike in Germany and Japan, in France and in England, the traffic goes on.

It is now necessary to ask what are the causes of prostitution, as a means to asking how the evil can be met. Dr. Sanger, in the book referred to above, attributes, out of 2,000 cases, 525 to destitution, 513 to inclination, 258 to seduction, 181 to drink.

Different writers differ from this. The most thorough statistical study was made by the Bureau of the Statistics of Labor for Massachusetts in 1888. It says:

The statistical method is not the best under which to determine moral conditions; yet, as an auxiliary, it has great efficiency. Statistical science can only be employed to show the results of the lives of the people; it cannot show the inner motives which lead to results.

Observation is not sufficient, and personal interviews might lead to difficulties greater than those belonging to observation alone. The force of statistics in such conditions is rather negative than positive, and this negative quality is brought into use here.

It is often flippantly asserted that the shop-girls, those comprising the class under investigation, recruit the ranks of prostitution. Of course, such a charge cannot be entirely removed when applied to any class. The only question here is, Does it apply to the class against which it is brought?

A few statistics of a negative character have been collected, relating to prostitution. This partial investigation has been made as to how far the ranks of prostitution are recruited from girls belonging to the industrial classes. It should be distinctly borne in mind that this partial investigation was applied only to what may be called professional prostitutes; for no statistical investigation can disclose the amount of immoral conduct of any class of people. So that quiet, unobtrusive, and unobserved prostitution, which exists in all communities, has no place in the present consideration.

Original investigation was made in the following cities: Brooklyn, Buffalo, Chicago, Cincinnati, Cleveland, Indianapolis, Louisville, Newark, New Orleans, New York, Philadelphia, Richmond, St. Louis, and San Francisco.

In 1884 the Massachusetts Bureau of Statistics of Labor made a report as to the previous occupations of 170 professional prostitutes in the city of Boston, and the facts then given have been incorporated in this report.

The number of prostitutes as stated in the following table, for any one of the cities named, falls far below the total number of prostitutes in that city, but the number and variety of those from whom information has been received are sufficient to insure representative results. Thus in Chicago, for example, there are, or were at the time of the investigation of the department, 302 houses of ill fame, assignation houses, and "rooming" houses, known to the police, containing 1,097 inmates. This investigation involved 557 of this number.

The facts as to marriage are shown by the following brief table, which gives the number of prostitutes furnishing information in the cities referred to, the number reporting themselves as having been married, and the per cent of the total number who were married:

| CITY | Number of prostitutes furnishing information | Number of prostitutes reported as having been married | Per cent of married of total number |
|---------------|--|---|-------------------------------------|
| Boston | 170 | 13 | 7.65 |
| Chicago | 557 | 143 | 25.67 |
| Cincinnati | 382 | 77 | 20.16 |
| Louisville | 203 | 70 | 26.62 |
| New Orleans | 167 | 4 | 2.40 |
| Philadelphia | 100 | 3 | 3.00 |
| San Francisco | 323 | 81 | 25.08 |

It is hardly worth while to take space at this time to give the occupations of all those who have entered prostitution from the different cities involved.

The number of prostitutes giving information was 3,866, and the following summary exhibits the occupations of this number preceding their entry upon their present life. For this purpose, occupations similar in character have been grouped, and no occupation or group containing less than

ten persons has been included in the classification—those numbering under ten being put into the general classification of "various occupations":

| | |
|--|-------|
| Actresses, ballet-girls, circus performers, singers, etc. | 51 |
| Bead-trimming makers, embroiderers, lace-workers | 21 |
| Bookbinders | 18 |
| Bookkeepers, clerks, copyists, stenographers, typewriters, etc. | 31 |
| Candy factories | 10 |
| Cigarette, cigar, and tobacco factories | 78 |
| Corset factories | 16 |
| Dressmakers, seamstresses, employees of cloak and shirt factories, buttonhole-makers, etc. | 505 |
| Hair-dressers and hair-workers | 15 |
| Housework, hotel-work, table-work, and cooking | 1,155 |
| Laundry-work | 70 |
| Milliners and hat-trimmers | 71 |
| No previous occupation (home) | 1,236 |
| Nurses (hospital and house), and nurse-girls | 27 |
| Paper-box factories | 33 |
| Rope and cordage factories | 22 |
| Saleswomen and cashiers | 126 |
| Shoe factories | 43 |
| Students (at schools or convents) | 14 |
| Teachers, governesses, etc. | 23 |
| Telegraph and telephone operators | 11 |
| Textile factories | 94 |
| Various occupations | 211 |

The following list shows the character of the more important occupations, omitted from the foregoing summary, with the number of women who had been employed in each, and which are included under "various occupations":

| | |
|----------------------------|---|
| Artificial flower-makers | 9 |
| Button factories | 9 |
| Farm-work | 9 |
| Canning establishments | 2 |
| Necktie-makers | 8 |
| Housekeepers | 7 |
| Straw sewers | 7 |
| Hat and cap factories | 6 |
| Bag factories | 5 |
| Canvassers | 5 |
| Clock and watch factories | 5 |
| Box factories (wooden) | 4 |
| Chewing-gum factories | 4 |
| Florists | 4 |
| Feather curlers and sewers | 4 |
| Restaurants | 4 |

The preceding figures are exceedingly instructive. By them it will be seen that the largest number coming from any occupation has been taken from those doing housework, hotel-work, and cooking; this number, 1,155, being 29.88 per cent of the whole number comprehended in the statement.

The next largest number, so far as occupation is concerned, ranks with the seamstresses, including the dressmakers, employees of cloak and shirt factories, etc., this number being 505.

A fact which strikes one sadly is the large number who enter prostitution directly from their homes. This number is 1,236, being 31.97 per cent of the whole number comprehended.

It cannot be said, therefore, so far as this investigation shows, that the employees in workshops are to be burdened with the charge of furnishing the chief source whence the ranks of prostitution are recruited.

The experience of the writer in making an examination in many cities, both in the U. S. and in Europe, sustains the statement, but more strongly than the figures here given, that working women do not recruit the houses of prostitution.

Nor does the investigation show that employers of labor are guilty of reducing their employees to a condition of prostitution, as is often alleged. Only in the rarest cases can one meet with a whisper that this is the case. And these whispers, followed to their source, have rarely disclosed any facts which would lead to the conclusion that employers make bargains based on the loss of character of their employees.

Working women are not street-walkers. They could not carry on their daily toil and walk the streets, too. A captain of police expressed the matter well when he said that people who charge the working women with walking the streets at night for evil purposes do not know what they are talking about. Night-walkers are, all of them, hardened professionals. The prostitutes, some of them, may have been hard-working women, but no working woman ever walks the streets as a prostitute. This captain said that, when a girl falls from virtue, she has first to graduate as a "parlor" girl, and then serve some time in a still lower house, before she is hardened enough to take to the streets.

Before, however, drawing inferences from this table, it must be remembered that it is only drawn from the facts as to girls in houses of ill

fame. Shop-girls, working girls, are, as a rule, not there. If investigation was made of girls occupying rooms by themselves, quite another story might be found. Even of the bagnios there is another side. Mr. Stead, in his "If Christ Came to Chicago," gives the testimony of Dora Claffin, the "Madam" of a house of ill fame. She says:

Economic Cause

Prostitution is an effect, not a careless, voluntary choice on the part of the fallen. Girls do not elect to cast themselves away. They are driven to the haunts of vice. The more distinctively womanly a girl is—and I mean by that the more she has beauty, delicacy, love of dress and adornment, feminine weakness—the easier a mark she is for the designing. And the designers are not wanting.

Girls, and I say this emphatically, are not seducers. They have innate delicacy and refinement. I say honestly that I do not believe that one woman in 10,000 would cast herself at the feet of lust except under duress or under the force of circumstances.

The recruiting grounds of the bagnio are the stores, where girls work long hours for small pay; the homes that have few comforts, and practically no pleasure; the streets, where girls are often cast, still unknown to sin, but in want and without shelter; in a word, places outside the levee, where distress and temptation stand ever present as a menace to purity and rectitude; behind every effect there is a cause. In the case of prostitution, the real cause lies not in the girls who fall, but in the social conditions that make the fall easy, and the men who tempt to the step and furnish the money support degradation after the step has been taken. Before reform in the levee is possible, there must be reform in the home, on the mart.

All writers on the subject agree in the fact that poverty leads to much prostitution, and that in stores, factories, and offices, salesgirls, working girls, and typewriters are drawn or lured by the lack of money or the desire for money. One speaker at the Baltimore congress considered the factory a mill for the production of prostitutes. Says the Rev. F. M. Goodchild (*The Arena*, March, 1896):

The money returns furnish a very great temptation to girls to part with their virtue. Some fall because they can not find work; some because they do not wish to work. Many a girl who is strong, and healthy, and comely, and lazy, learns that there is a market for such as she; that she can earn more in a night by sin than she can in a week or a month by work, and she sells herself accordingly. Mr. Stead reminded the Woman's Club of Chicago that the peculiar temptation of a woman is that her virtue is a realizable asset. This vice costs a man money; to a woman it yields money. Mr. Booth says that the number of young women who receive \$2,500 in one year for the sale of their persons is larger than the number of women of all ages, in all businesses and professions, who make a similar sum by honest industry. In sin the prizes come first; in honest callings only after long and painful toil. Even in the common houses on Bainbridge Street, at a fifty-cent rate, girls often make \$20 or more a week.

Yet, on one point, one must be guarded. Even if it be true that women of impure life average \$20 a week by their vice, it by no means proves that the average woman can get \$20 per week. A few women of the demi-monde, mistresses, and even prostitutes, have hundreds, and thousands of dollars squandered on them in a brief while. This enormously raises the average income of their class, but the great mass of these women get vastly less. At best, their income is but for a few years, and vast, vast multitudes never live in luxury, but in utter want. Many of their homes, many houses of ill fame are not only not attractive, but poorly furnished. It must be remembered that the wages of sin rise and fall with the market, and with the conditions of different countries. If in "good times" men throw money away recklessly, in hard times, when the women are most tempted to prostitution for profit, they do not. Instances are not unknown where girls have left situations with low wages for the reported "high wages" of the prostitute, and have found,

as actual fact, that, as prostitutes, they earned even less than before. Prostitutes starve; prostitutes are "unemployed," even as in any trade. All this must not be forgotten, even while it remains true that an enormous amount of prostitution is due to the economical conditions which often make it next to impossible for a single woman to earn a decent living, and throw thousands of women on the streets, and bring immorality within easy reach of almost any man.

The throwing of the sexes together in factory and in store, and quite as much in private counting-rooms and offices, has its dangers. Coeducation in the halls of learning is winning its way. Working together in communication, where morals are often at their lowest, is another thing. The evil lies not in the mingling of men and women, but in the evil environment.

The stage, the concert hall, and the ball bear a large responsibility. From the spectacular play and from the ball, with underdressed women at the one, and underdressed women and wine at the other, men hurry to the brothel. It by no means follows that the cure lies in the abolition of the theater or the dance (tho some think so), yet the part in this matter played by the present stage and fashionable society cannot be denied. The supreme social cause of prostitution, however, we believe, has not yet been mentioned. This is the crowded tenement. (See OVERCROWDING; TENEMENTS.) When boys and young girls have no attractive home, and no healthy playground, they must be on the streets. A child cannot be kept in the house all day, and live. When a girl comes from a school or from the store, to the crowded living-room or flat, and finds the narrow quarters redolent with the steam of washing and the fumes of cooking, she must (in the cities) go on the street for fresh air. There bad company captures more girls than in any other one way. Not many girls sell themselves, for the first time for money; after the first great downward step, money directly plays its part, but the supreme social cause of prostitution we believe to be the bad housing of the poor, resulting from low wages, and the poverty of the great masses in our cities.

REFORM

In classic and earlier ages prostitution, not being generally considered an evil, was rarely legislated against; adultery on the part of the wife was considered the one social evil. The Germanic tribes, however, Tacitus says, punished an unchaste person by death (later by punishment and beating). The early Christian emperors also made some attempts at repression of the evil. (See CHRISTIANITY AND SOCIAL REFORM.) Gradually, however, the State came to recognize the evil and undertook to control it. The aim was to

keep the prostitute a class distinct from the community and to prevent the brothel from being a place of disorder. The brothel was therefore licensed and controlled. The prostitute played a recognized part in society, taking part in public festivities, processions, and even sacred festivals. The public women were, as in Nuremberg, organized in guilds of their trade. As later, however, corruption grew, more repression was tried, and sumptuary laws passed controlling these houses, etc. From the medieval customs developed the modern European methods of

History

"regulation." In 1802 in Paris the prefecture of police proceeded to register public prostitutes and to impose upon them the obligation of submitting to fortnightly examination; a little later prostitutes were confined to houses specially licensed for that purpose. By 1848 the present French system was practically developed; prostitutes being licensed either in houses of prostitution or of accommodation. Those in houses are examined every week; those at large every two weeks; the diseased are sent to the hospital of the prison of St. Lazare and detained there till they are supposed to be cured. The medical service numbers a chief and some fifteen assistants. In Berlin this system began, in essence, as early as 1700. In 1839 the licensed brothels were confined to one street. After various experiments, in 1856 the licensed brothels were closed. In Germany to-day, generally, the prostitutes are registered and examined periodically, and in many cities licensed brothels exist.

This is still the general system in Europe, tho everywhere unregistered prostitutes outnumber the registered, often ten to one.

It was in 1864 that by act of Parliament, supplemented by additional legislation in 1866, and again in 1869, the regulation system was introduced in Great Britain, under the name of the "Contagious Diseases Acts." They were applied to sundry military districts, ostensibly to promote the health of the army, but

Great Britain with the purpose on the part of their projectors, later avowed, ultimately to extend them also to the civil population. When their real character and object became known, a vigorous repeal agitation was begun, under the leadership of Mrs. Josephine E. Butler, which was continued for twenty years. At the end of the two decades the repeal movement was triumphant, and the acts were swept from the statute-books. During the prolonged contest the battle of statistics was many times fought, and with great earnestness on both sides. Figures were employed to prove both the hygienic success and failure of the acts.

In America there have been attempts to introduce the registration system in almost all the larger cities, but only in St. Louis has it ever been tried for any length of time, and was there given up after about four years.

It was in 1870 that the license system was inaugurated in St. Louis. The authority for it was obtained by a legislative trick: the interpolation, without debate, of the two words, "or regulate," into

United States an amendment of the city charter, intended, as was generally supposed, to suppress prostitution. The legal effect of this amendment, as was subsequently decided by the Supreme Court of the State of Missouri, was to repeal all State laws prohibiting prostitution, so far as St. Louis was concerned, and to give to it a business status as a legitimate industry. A German municipal official was deputed to visit Europe, to familiarize himself with regulation laws there. An ordinance was subsequently adopted, requiring the registry of prostitute women.

The regulationists of St. Louis, especially those connected with its Board of Health, attempted to show by the figures of the earlier registrations, made at intervals of a few months, a diminution in the number of prostitutes. Dr. William G. Elliot, the honored president of Washington University of St. Louis, who made a most thorough, impartial investigation of the whole matter, says of this claim of a diminished number of prostitutes, that: "In fact, they had scotched the snake, not killed it, and in all probability the number of prostitutes had not been diminished at all. To scatter a nest of hornets," he says, "is a very different thing from its destruction."

The results during the progress of the experiment proved an increase of 34 per cent in the number of brothels, and an increase in the number of registered women of more than 35 per cent. There was also an undoubted increase, meanwhile, of clandestine prostitution. Concerning the sanitary

aspect, Dr. Elliot says: "What is still more startling, when the stamping-out process is examined, it appears that with the number of diseased women under treatment in 1871: was 18 out of 480, or 3½ per cent, it has risen now (1873) to an average of 40 out of 653, or over 6 per cent, showing the remarkable fact, to which, however, we can find a parallel in Paris itself, that even among the registered and regularly inspected prostitutes the hateful disease may increase, a result which, tho unexpected, ought not to surprise us so long as the male prostitutes are themselves exempt from medical inspection." How incomplete was the registration, and of how little practical value, in a sanitary point of view, the system of medical inspection, may be seen from the significant figures presented by Dr. Elliot, taken from the reports of the chief of police of St. Louis, for the years 1871 and 1872. He says: "The year 1871, ending March 31st, shows that out of 3,722 females arrested 1,536 were prostitutes, and 218 keepers of bawdy houses (the Board of Health report of the same date shows 480 registered prostitutes and 99 keepers), being a total of 1,744, or 46 per cent of all females arrested. The year 1872 shows that out of 3,187 females arrested, 2,613 were prostitutes and 71 keepers of houses, or a total of 2,684, being over 84 per cent of all females arrested, and an increase of 940 prostitutes arrested, or 18 per cent more than the previous year."

When it was discovered what had been accomplished by legislative legerdemain, a vigorous agitation for repeal began. A petition for repeal was signed by 4,000 women of St. Louis, and presented to the Missouri Legislature. The archbishop, bishop, and Catholic clergy, nearly all the Protestant clergy, and a majority of the St. Louis bar were enlisted in the cause of repeal, over 150 lawyers and physicians.

The legislature of 1873-74, after a prolonged and embittered discussion, finally voted the repeal by a vote of three fourths of all the members of the Senate, and the House by 90 to 1.

The Philanthropist, to which we are indebted for the above details, thus sums up some of the evils of the license system:

1st. It confers the sanction of law upon the barbarous trade in women.

2d. It subjects these tempted and often coerced helpless women to the atrocity of continuous compulsory examination by men, and the conspicuous posting of their names as having been thus systematically outraged.

3d. It fosters vice instead of "preventing" it, in that it contemplates opportunity, facilities, and safety for the "guests" who are more than equal participants.

4th. It fails to protect health for the community, because it does not adopt any precaution against the spread of venereal contagion by the "guests" for whose indulgence it provides. It makes no provision for their examination and cure, tho they are much more numerous and dangerous than their victims, as transmitters of disease.

5th. It makes a permitted trade of the cruel and dastardly occupation of the procurer and procuress.

6th. It grants permits at a price that will not prohibit the dreadful trade, but will invite to it.

On the other hand there seems little use in the mere effort to suppress houses of prostitution.

In New York City, owing to the agitation conducted by Dr. Parkhurst, hundreds of prostitutes have been turned out of their houses and the houses closed by the police. It is considered a triumph of morals, and other cities are following the example.

But where have the women gone? Have they been redeemed to virtue? If they have, have their male partners in vice been redeemed? If not, even if the women have been redeemed, these men remain to seduce other women to take the place of their victims that have been rescued from them. But no informed mind fancies that closing disorderly houses redeems their inmates to virtue. Where then are they? In the flats of the upper middle class and among the tenements of the poor. Formerly they were brought little in contact with home life and childhood. Now they are scattered among the homes and children of New York. Is this a triumph of virtue? Driving sinful women to continue their trade among homes and children, and letting men go free—is this reform? Dr. Rainford well says that you might just as well take cases of smallpox, and say they should not be allowed in houses by themselves, and therefore scatter them around among homes.

Nor are these results imaginary. Says the report of the New York Tenement-House Committee of 1894 (p. 88):

The presence of many immoral women in the tenement-houses, where they are thrown in contact with respectable people, and, worse than that, with large numbers of ignorant and innocent children, forms a most deplorable condition.

There has been a manifest increase in this condition during the past year or eighteen months, and there is no doubt that the influx of prostitutes into actual residence in tenement-houses is due to the police raids, which have closed most of the houses of ill fame in the tenement-house districts. Under the old order of things, no matter what its evils may have been, the immoral women occupied houses by themselves. At present they form a part of the life of the great tenement-houses, and thus their contaminating influence is felt far more directly by the general public than was formerly the case. The tenements always have had, and probably always will have, their share of immoral women—of a class peculiar to them and separate from the professional prostitutes driven of late into them, from houses of ill fame. Most of this tenement class consists of women who have been abandoned by their husbands, and who, in order to support themselves and their legitimate children, are driven to depend to some extent upon evil sources of income. Such abandonment is distressingly common among certain foreign nationalities. Probably fifty cases have been brought to your secretary's attention. These women, however, generally work when they can, and turn to prostitution only as a last resource. They are surrounded by none of the glamour of the professional prostitute; do not ordinarily live or dress more elaborately than other inmates of the house in which they live, and are generally regarded with more pity than envy or resentment by their neighbors and their neighbors' children. Thus they are not so especially dangerous to the morals of the house. But an apartment full of such prostitutes as have now been driven into the tenements, where they are surrounded by comparative luxury, and live lives of apparent ease, in the midst of a household of adults and children, whose frugal, honest living is obtained only by the hardest of work and the most rigid economy, can scarcely be less dangerous to the moral health of the house than an apartment full of cholera-infected persons would be to the physical welfare.

More Raiding a Failure

Some persons, therefore, would not license or inspect houses of ill fame, but simply, if they do not become too bold, allow them within certain limits by themselves and try to fight the evil by lifting up the general standard of the community.

But the complete districting of the evil seems impossible, if desirable. Mr. E. T. Gerry, in *The Philanthropist* (March, 1895), thus describes the results of the two main experiments in this direction:

In the winter of 1886-87, while at the city of Rome, Italy, I had a personal interview with Cardinal Simeoni, which lasted over two hours, chiefly in reference to the course pursued by the Italian Government while in the hands of the Vatican, in the matter of regulating prostitution. The cardinal stated to me that the experiment of attempting to confine sexual vice within a specified district had been most thoroughly tried. A portion of the city, remote itself and not particularly attractive for purposes of residence, had been selected. . . . At the same time a very strict cordon of police was placed around the geographical boundary, and any attempt on the part of females who had once entered the district to escape therefrom was followed by prompt and immediate arrest. The idea was so novel that at first quite a number of registered prostitutes entered the district, hired and occupied the houses, and attempted to ply their vocation there. But the district soon became very notorious. The thieves, the lawless, and the seditious found their way there, and became permanent residents. They brought with them very little money, and as the sole means which the inmates of the district had of supporting themselves was by the sale of their persons, it was obvious that their custom must come from without and not from within, as men generally did not care to be known as inhabitants of the district. And as soon as the fact of its establishment was made public, men were very wary about entering the district for fear of identification. . . . It was not long before the storekeepers complained that they could not make a living. Even the women found that the money did not flow in upon them as it did when they practised their calling unrestricted by geographical limits, and it was not long before escapes from the district became impossible of prevention by the police, and some of the most notorious women in Rome, after having been put there, and sent there, made their escape and were found in other quarters, plying their trade. . . .

Districting a Failure

The cardinal stated to me that the attempt to district vice was in his judgment a stupendous failure; that the Church had used every effort to reclaim the fallen when so environed by the police and placed in a locality where it could put its hand upon them, but to no purpose.

One further effort for localization of the social evil deserves

to be noticed, that of the Yoshiwara in Japan. For a long time previous to the contact of Japan with the enlightened nations of the earth, the social evil was looked upon as one necessary and unavoidable, and the government took entire charge of the matter. In a suburb adjacent to the capital (Tokio) large houses were built for the purpose, some of them elaborate in construction, and the whole guarded most thoroughly by the soldiery. The number of prostitutes in Tokio alone is said to be about 5,000. The children of the poor are usually utilized for the purpose and sold by their parents, who receive a stipulated income as the result. It is not an unusual thing for these girls to marry, and they are not looked upon as outcasts or pariahs of society by any means. The girls in these establishments range in age from ten to eighteen, and, owing to the developing influences of the climate, at the latter age they are as mature as most of our women at twenty-five to thirty. These are the regular, so to speak, licensed or recognized prostitutes. The women are permitted to leave and marry when they choose. This number of course does not include the kept mistresses of foreigners or others, who occupy small houses at the expense of their maintainers. Of these districts, which are known as Yoshiwara, there are five in Tokio and two in Yokohama, the latter possessing probably the largest and best known. The government has entire charge of the system, derives extensive revenue as the result, and under the Japanese code of morals, from which sexual morality is practically excluded, it is said to be a success so far as engendering public peace and quietness. Such a course naturally destroys all appreciation of the vice as vice.

Yet, on the other hand, there seems little hope in leaving the evil alone.

In London there is neither license, examination, nor practical restriction. Police regulations of recent years have somewhat kept prostitutes off the streets and certain squares where in former years in the late evening they almost literally blocked the sidewalk. Yet facts (see p. 980) certainly show that lack of restriction is no cure. The police usually limit their attempt to keep the peace to requiring these women to move on, and as passers-by do not care to make complaints against them, they simply do move on. A large number of the brothels are situated on the outskirts of London, in such places as St. John's Wood, Pimlico, and the like, which are easy of access by cabs and the railways. Most of these street prostitutes are said to be discharged from the Continent, because infected with disease.

It is thus easier to show what not to do than what to do. With the means of reaching the evil through personal work, religious or ethical, we are not, in this encyclopedia, concerned. Many, however, believe that this is the main thing to do, to raise a higher standard of personal purity, and, above all, an equal standard of purity for both sexes.

The writer of the article in the *Westminster Review*, quoted above, says:

One aim most, if not all, schemes of reform have in common, and that is the establishment of an equal standard of sexual morality for both sexes. On all sides it seems to be agreed that the existing dual standard of morality is, or will be, doomed, now that society, and especially the female portion of it, is becoming so keenly alive to its evils. It is also felt that unless masculine morality is raised to a higher level, feminine morality may fall from the exalted position it has held for so long, as it awakes to the full value of the fact that its purity is only playing into the hands of the impurity which it encounters in the other sex. The proposed paths toward the desired goal are very wide apart, but there are a few main ideas on the subject which can be briefly described.

First, there is the movement started by those persons who believe that the purification of our social morals can only be attained by setting up for men the same high standard of chastity and pureness of living as that which has been hitherto considered as binding only upon women of the protected and wife-supplying classes. . . .

Then there are those who take an exactly opposite view, and who believe that the end is to be reached by some extension of sexual freedom to all classes of women. They regard the attempt to raise men to that high level of morality hitherto reserved for women as a natural impossibility or Utopian dream, and they would seek for equality by lowering

Ethical Means

the standard for women, and thus bridge over the wide gulf which now exists between the average sensual man and the average chaste woman, and still more between the average chaste woman and the woman of the streets.

The writer sympathizes with neither of these extreme views, and favors what he regards as the middle course, viz., reform of sexual morality through more liberal divorce laws. He believes that erring humanity ought to have the opportunity of retrieving even its matrimonial mistakes and failures, and that the sacrifice of individuals to an absolute system is neither moral nor expedient. The current objections to liberal divorce laws he regards as based on religious prejudices rather than on utilitarian social considerations.

For contrary views, see **DIVORCE** and **FAMILY**. Says the Rev. F. M. Goodchild (*Arena*, March, 1896):

The first thing to do, probably, is to arouse the people to a sense of the enormity of the evil as it exists among us. . . .

The best mitigation, probably, must come from our homes. Parents have been criminally negligent. Ignorant innocence leads most girls astray. A prudish silence

The Home

lands many a girl in the brothel, and provides her customers as well. It ought to be possible to impart to our children some instruction about these most important relations of life, without mantling the cheeks of parent or child with a blush. It is little short of criminal to send our young people into the midst of the excitements and temptations of a great city with no more preparation than if they were going to live in Paradise.

And I cannot escape the conviction that women hold in their hands the key to the solution of this problem. They are cruel in their severity toward their fallen sisters, but they are criminally indulgent toward the men who cause their fall. The woman sinner is reprobated. But the man sinner is made a hero, is welcomed into respectable homes, is permitted to marry a pure girl and make her the mother of children, cursed before they are born with lecherous appetites. Let woman's attitude be changed.

Yet, undoubtedly, organized society can do something. It can prohibit solicitation on the street alike for men and women. It can arrest and expose men as well as women in disorderly houses, condemning them to punishment and exposure, and not merely to a fine. It can change the laws and make them bear equally on men and women (see **AGE OF CONSENT**; **MARRIAGE**; **DIVORCE**; **WOMAN**). There is no question that fear of exposure does deter many men from visiting these houses.

The report of the New York "Committee of Fifteen" (1902) says:

The better housing for the poor, purer forms of amusement, the raising of the conditions of labor, especially of female labor, better moral education, minors more and more withdrawn from the clutches of vice by means of reformatories, the spread of contagion checked by more adequate hospital accommodations, the evil itself unceasingly condemned by public opinion as a sin against morality and punished as a crime, with stringent penalties whenever it takes the form of a public nuisance—these are the methods of dealing with it upon which the members of the committee have united.

Yet many reformers, all Socialists, all extreme individualists, and a growing number of earnest men and women of all schools of thought, believe that none of these legislative reforms go to the bottom causes of prostitution. These they find in wrong sociological ideas, coupled with unjust economic conditions. Their remedy is education in right living and relief from economic injustice.

Economic Reform

PROTECTION: An opinion prevails in some circles that, while free trade is scientific and founded upon natural law, protection is artificial,

devoid of philosophy, and but a scheme of selfishness. Protectionists claim that this is untrue; that the theory of protection is, to say the least, as philosophical as that of free trade; that it is more natural, because built upon self-defense, which is the first law of nature; that it promotes, rather than hinders, the development and enjoyment of natural business opportunities; that it coordinates our national existence, and forms the chief reason for it; that it is less selfish than free trade, because it is necessarily cooperative, and that it is more universal, because it is applicable to all the industries of a people, while free trade unavoidably sacrifices some to others.

The history of protection is the history of civilization. Every group of humanity that has risen a degree above barbarism has adopted some form of protection. Preparations for war, the sometimes provocative of war, are generally regarded as protective to peace. Washington advised this precaution in his farewell address. Anciently a nation's commerce, industry, and existence depended upon its readiness for instant defense; nowadays strength in all the resources for war is more important than weapons in hand. An industrial policy which makes the unit man self-reliant and resourceful, and not dependent upon others, is commended by free traders; it is equally claimed by protectionists in its applicability to groups. The people who purchase ore, or wheat, or wool, because it is temporarily easier or cheaper to exchange for them lumber, or fish, or furs, than it is to raise them, never become strong for either peace or war. A few individuals, engaged in trade or transportation, may thrive. But the laws of business are not confined to the handling of merchandise. Production is more important than distribution. The nations which have attained highest development are those which have made the most of their natural endowments. Without a single exception they have done this by protection in some of its varied forms. The only free-trade nations on the earth to-day, Great Britain and Holland, attained greatness through centuries of protection, and maintain maritime supremacy still by that means.

I. History

Commerce between the nations of antiquity was almost exclusively in dissimilar or non-competing articles. This was natural and friendly commerce and it created no occasion for discriminating duties. The most instructive and eloquent description of this commerce is found in the twenty-seventh and twenty-eighth chapters of Ezekiel, in which the prophet portrayed the glories of Tyre. The peculiar products of all lands were brought to Tyre—fine linen from Egypt; purple from the Greek islands; silver, iron, tin, and lead from Tarshish; brass from the Taurus; horses and mules from Armenia; ebony and horns of ivory from many isles; wheat, honey, oil, and balm from Israel, and sheep and lambs from Arabia, all of which were traded for Tyrian wares, "by reason of the multitude of thy handiworks," and "when thy wares went

Ancient Times

forth out of the seas, thou filledst many people; thou didst enrich the kings of the earth with the multitude of thy riches and of thy merchandise." So all this commerce appears to have been mutually beneficial; hence there was no occasion for protection against any part of it

by Tyre, or by the other nations. Competition, in the modern sense, was practically unknown. Whenever it appeared war resulted, and one nation or the other was reduced to vassalage.

There is no record of the revenue laws applicable to commerce. When Matthew was called to the discipleship, he was "sitting at the receipt of customs," on the western shore of the Sea of Galilee, but whether he collected from the caravans, or whether the term "customs" was used indiscriminately for tax or tribute, external or internal, there is nothing to show.

There is almost equal obscurity as to the customs laws of later Rome. Some of the time, at least, protection was applied on land, along the great roads, where traffic was often competitive. This was the case under the illustrious reign of Theodoric, the greatest of the Gothic kings, whose chief desire seems to have been to "restore to Italy its long-lost material prosperity and plenty."

Reviving prosperity caused extensive importations of luxuries from the East. They were purchased by the upper classes in such quantities as to drain the nation of its gold, sometimes at the rate of \$4,000,000 a year, and thus unemployment and decay set in. The Romans were invaders, settlers, builders, warriors, mariners, farmers, but they did not excel as merchants and manufacturers. When conquest ceased to add to their riches, their economic science was not far enough advanced to supply the deficit from their own resources. So long as they could thrive at the expense of others, their thrift was great; left to themselves, they failed.

Venice and Later Italy.—But after 300 years, those who had fled before the Goths and Huns to the marshes of the Adriatic began to develop the wonderful city and commerce of Venice. Forced to a seafaring life, they became familiar with the productions, and, gradually, with the processes of other peoples. To commerce they added manufacture, and soon became famous for ingenuity. They excelled all but the Orientals in the manufacture of textiles, metals, and glass; and as this brought them into direct competition with the artisans of the East, laws were enacted to encourage home production, and to prevent workmen from carrying their arts to foreign countries. Other Italian cities—Florence,

Middle Ages Naples, Genoa, Milan—followed the example of Venice, and became seats of fine production, from which Europe drew supplies. After centuries of unexampled prosperity, Venice became involved in foreign wars, and fell into decay, but United Italy is enjoying greater thrift than ever before, as the result of the wise industrial policy which Venice started, and which, extended and improved, is the national policy to-day. Since 1900 the manufactures of Italy have made rapid progress, and wages have been nearly doubled. Extensive immigration to the United States, where ample employment at high wages has been found, instead of proving an economic loss to the country, has resulted in the return of so much money that the industrial life of the nation has felt its reviving influence. Italy appreciates the value of protection because it promotes the employment of her people both at home and abroad.

The Hanseatic League.—It has been claimed that the manufactures and commerce of the eighty-five free cities of the Hanseatic League,

which flourished in western Europe from 1241 to 1575, were built up without protection, and were greatly promoted by free trade. The fact is otherwise. The league itself was for protection from the cupidity and oppression of the monarchs of those countries; from piracy; from the cornering of raw materials; from trespass upon the field or specialty of one member by another; from the theft of their processes by aliens, and for the encouragement of guilds, apprenticeships, invention, and progress in handicraft. To be sure there was no protective tariff, in the modern sense, but this was because nearly all commerce was an exchange of dissimilar articles, peculiar to different countries.

Flanders and Holland.—What has been said of the Hanse towns applies equally to the Flemish and Dutch a little later. They attained supremacy in manufactures, first, by supplying the home market, and then foreign markets, with goods that were different from what others offered. They did not attempt to compete with Venice in silks, or with India in cottons, but they became the best spinners and weavers of flax and wool in the world, and their cutlery, armor, and leather equaled the famous products of Damascus and Calcutta, which were then more expensive.

Until England had been twice invaded and conquered by foreigners, and until the foreign and domestic trade had all fallen into their hands, no attempt was made to recover for Englishmen their natural opportunities. King after king had sold concessions to aliens, and the native population, almost exclusively farmers and miners, with no home market of any value, and dependent upon other countries for all the products of industrial art, was kept in

Protection in Britain hopeless poverty and weakness. Finally, the Anglo-Saxon spirit rose. There was a revolt against the aliens. It took the form, under Edward I., of higher duties on goods imported by strangers than by Englishmen. Under Edward II. this policy was abandoned, but in 1337 a statute of Edward III. "laid the foundation of the liberties of the people, by providing for the diversity of their employment, and the development of individual faculties." This famous statute prohibited the exportation of wool and the importation of woollen cloth, and required Englishmen to wear domestic cloth. Such a statute could be called drastic and tyrannical now, but it was absolutely necessary then; in no other way could domestic manufactures have been established in the face of all the advantages held by the aliens. The policy was strengthened in subsequent reigns. Under Richard II. it was "ordered and assented that no merchant stranger alien shall sell or buy merchandise within the realm with another stranger merchant alien, to sell again," and under Edward IV. the first of the corn laws "prohibited the import of foreign-grown grain when the price of wheat at the port of entry did not exceed six shillings and eight pence to the quarter." In 1463 a statute prohibited the importation of sixty-seven manufactured articles in most common use; really more than that, for some of them were classes of articles; in 1488 Henry VII. induced skilled laborers to come from the Continent and instruct his people, and in 1552 a general act was passed for the regulation, control, and encouragement of the woollen industries of the realm. Navigation laws were enacted under Mary and Elizabeth, which gave such preference

to English shipping as to drive foreign ships from the internal, coastwise, and foreign trade of the realm. Thus, in 200 years, by the most rigid policy of protection ever before or since set up by any nation, Britain rose from practical vassalage to one of the most independent, prosperous, and powerful countries in the world, and gained the ascendancy in manufactures, trade, commerce, and wealth, which, in many respects, is maintained to this day, and which in no way has been surpassed, save by other protective nations. Those who attribute Britain's greatness to free trade, which did not begin until 1846, when her industrial primacy was of itself protective, and was sure to remain so for many years, must have forgotten all her earlier history, and must have attached more importance to the cramp and hindrance of the guilds which were a part of the protective policy, and to some of the prohibitions, which, however necessary and useful in the beginning, afterward became a hindrance, than they attached to the great and necessary acts which emancipated the kingdom from industrial, monetary, and commercial servitude, and made her factories and her artisans, her merchants and her ships, the wonder and the envy of the world. Since the Royal Commission of 1887 on the Depression of British Industries made its report, there has been growing in the United Kingdom an opinion that a return to protection will be wise if not necessary. It did not take form in politics until 1903, and even then most of the parliamentary elections turned on other issues, but fully 45 per cent of the electorate voted for the Chamberlain policy. The scheme is to have preferential duties between all parts of the empire, and this implies the abandonment of free trade by the United Kingdom. Economically it means imperial federation. Some call it "fair trade" in contradistinction from free trade. It draws support from all parties and factions, but organized labor opposed it in 1903, through fear that it would increase the cost of living. Its advocates showed, however, that when the duty on sugar was raised the price was not increased; that when the shilling registration duty on corn was taken off in 1869 the price of bread was not lowered; and that when it was put on again in 1902, on account of the cost of the Boer War, it did not raise the price of bread; also that when Italy raised the corn duty in 1888 from 1s. 10d. to 7s. 6d. the cost of food was not increased, partly because foreign growers met the duty by lowering their prices and partly because domestic agriculture was greatly stimulated by the protection; and finally, Mr. Chamberlain promised to remove the duties from tea, coffee, and chocolate, so that the working-man's table as a whole should cost less rather than more. For the first time in more than fifty years literature contrasting the effects of protection and free trade was circulated, the sources of it being a committee at Birmingham and the United Empire Trade League in London. It was admirably prepared, its data authentic, and its arguments so clear that the plainest people could understand them. The end is not yet.

Until near the close of the sixteenth century the condition of the people of France was similar to that of the English a century before. But in 1592 Henry of Navarre became king, and with a purpose to develop the country,

Sully, who was appointed Minister of Finance, studied conditions in all parts of the realm, and

soon the nobles were prohibited from taxing the people; the royal treasury became plethoric; roads, bridges, and canals were built; mines were opened, and manufactures were introduced by giving protection to artisans who were induced to come from Holland and Venice. Slow progress was made under the next reign, that of Louis XIII. and Cardinal Richelieu, but in the latter part of the long reign of Louis XIV., with the great Colbert as Minister of Finance, not only was Sully's system of internal improvement continued, but the first general tariff of duties upon imports was enacted. This was in 1664. The principles upon which this tariff was based were: "1. To reduce the duties on the importations of all articles required for the manufactures of the kingdom, and 2, to exclude foreign manufactures by raising the duties." In 1667 duties were much increased on such articles of foreign production as competed with the new industries; towns sprang up where there had been but wastes; the people turned from discontent to occupation, and the country grew great and strong. After the death of Colbert the king committed the fatal blunder of persecuting the Huguenots, with the result that nearly 400,000 of the people, most skilled in industry, fled the kingdom, and spread over countries that soon became rivals in peace and enemies in war. The next century was one of many wars and abuses which culminated in the Revolution. An experiment in fiat money had been tried, with disastrous results, of course. Fully one half of the people belonged to the privileged classes, and paid no taxes. Agriculture, thus doubly burdened, fell into decay. Such conditions had not been favorable to the growth of manufactures, and what protective laws remained were all but inoperative. And what was even more to be deplored, they were confused by a school of French economists which became known as physiocrats, which was formed by Quesnay, the physician of Louis XV., and which first promulgated the free-trade doctrine of *laissez-faire*, "let things alone," with the abuses of power which were tyrannical on the one hand and paternal on the other. These so-called economists failed to see the difference between a government's protecting the natural opportunities of its people and the exemption of favorites from taxation, or between promoting the growth of industries which would afford employment, yield wealth, and reduce the cost of necessities, and the granting of monopolies, farming the collection of revenue at excessive profits, and the placing of duties upon exports as a means of replenishing the plundered treasury. In the presence of so many abuses of power, every act of government that related to revenue, or to the industries of the people, seemed to them alike a wanton interference. It is easy to excuse them for the failure to discriminate, but the motto which they coined for their place and time, and which has been accepted as the fundamental principle of free trade, is seen in the light of the subsequent history of France, and of all other nations, to have its limitations. "Let alone" may well be said to a blacksmith who would tinker a watch, but what man of sense would cry it to a general about to repel an invasion; a board of health redeeming a marsh, or a government whose people are competing against the export bounties and subsidized ships of other nations? Napoleon Bonaparte, who, if he had known when to stop his foreign wars, would have been

Protection in France

The greatest statesman as well as the greatest conqueror of his time—he of whom Byron wrote

A single step into the right had made
This man the Washington of worlds betrayed—

did not forget the industries of France, and did not neglect the means for their promotion. "Duties," said he to Las Casas, at St. Helena, "which were so severely condemned by political economists, . . . should be the guaranty and protection of a nation, and should correspond with the nature and the objects of its trade. . . . Foreign trade, which, in its results, is infinitely inferior to agriculture, was an object of subordinate importance in my mind. Foreign trade is made for agriculture and home industry, and not the two latter for the former." During and since his reign France made its greatest progress in the arts of peace, for protection has been its policy, with the exception of a partial abandonment, which Cobden persuaded Louis Napoleon to make, and which was one of the causes that led to the downfall of that emperor, and the humiliation of his country. During the twenty years of the Cobden treaty French commerce declined 65 per cent, and many industries barely lived, thanks only to the partial protection that remained. On Jan. 26, 1876, M. Thiers, afterward the first president of the French Republic, and one of the greatest statesmen of any country, ancient or modern, in speaking upon tariffs to the Assembly, drew this instructive and most prophetic contrast between France and England. After complimenting England for its civil liberty, and other great characteristics, he said:

But I may be allowed to say that it has in its industrial greatness that which is not so solid as the situation of France. France has her consumers within itself. Its market does not depend upon a cannon-shot fired in Europe. And for exportation she has her beautiful products. England, on the contrary, has an artificial existence. She depends upon the days of the United States; upon the doings of her colonies, which already oppose her with hostile tariffs. May not the day come when its immense production will find no purchasers? She produces ten times as much as her consumption. This little island, in the words of Fox, embraces the world. True; but when she embraces the world, she is vulnerable everywhere. Such was the situation of Holland in the seventeenth century, which had realized a prodigy almost as marvelous. What was needed to make Holland, which gave laws to France, descend from this lofty place? It needed only fifty years. It needed only a Navigation Act in England; it needed only a Colbert in France. God forbid that I should predict for England such a destiny! but I repeat it, her existence, which depends upon consumers which she seeks everywhere without herself, is less solid than that of France, which has her consumers in her own bosom.

Germany is no less interesting than France. The first progress in manufactures began with the coming of the Protestant refugees from France after Louis XIV. had revoked the Edict of Nantes. Under Frederick the Great, from 1746 to 1786, the economic policy of Prussia embraced duties

on imports, bounties on exports, premiums on production, and exemptions of new manufactures from taxation, and the result was an unprecedented development of all the industries of the kingdom. The smaller German states presented a less encouraging picture. Governed expensively, their exactions of revenue were burdensome to industry and restrictive of trade in its natural field. Later their industries were nearly crushed by the Napoleonic wars and the inundation of French and English goods after the battle of Waterloo, but in 1818, Prussia leading, they adopted a vigorous policy of protection. It abolished State monopolies and special privileges

to individuals, gave all citizens equal chances, admitted necessary raw materials free, and adhered to the system of duties and bounties established under Frederick. Subsequently it was found that most of the states were too small for each to set up a national policy of this kind. They needed each other's markets. In 1833 six of them formed a Zollverein, or customs union, with no duties between themselves and with a division of outside duties according to population. By 1842 the other German states had come in. The basis was the Prussian tariff of 1818. The administration was by a Zollverein Parliament, which was succeeded by the German Reichstag when the empire was formed in 1871. From time to time duties had been raised to meet aggressive importation, but the production of fine goods had hardly been attempted, and the classes which consumed them were easily persuaded by Mr. Cobden that they ought to have them free of duty. Those classes were influential. The result was that a free-trade wave swept over Germany, first in the form of lower duties in 1865, then in a commercial reciprocity with Austria in 1868, and by successive annual reductions until the full English policy was reached, when everybody felt rich and grew extravagant and careless under the payment of the French indemnity in 1871. The result of open ports was to close the factories. There was failure upon failure. Wages and prices fell, but taxes rose. Foreign corn depressed agriculture. The people wore the fabrics of England and France, and labor began to starve. A powerful reaction set in. Bismarck, after profound study, began in 1878 to advocate protection. Among his arguments was this:

The success of the U. S. in material development is the most illustrious of modern time. The American nation has not only borne and suppressed the most gigantic and expensive war of all history, but immediately afterward disbanded its army, found employment for all its soldiers and marines, paid off most of its debts, gave labor and employment to the unemployed of Europe as fast as they could arrive within its territory, and still by a system of taxation so indirect as not to be perceived, much less felt. Because it is my deliberate judgment that the prosperity of America is mainly due to its system of protective laws, I urge that Germany has now reached that point where it is necessary to imitate the tariff system of the U. S.

In 1879 the Reichstag accepted his policy by a vote of 217 to 117. In two years the exports of manufactures increased 33 per cent; in eight years the number of artisans in iron and steel increased 30 per cent, their aggregate wages increased 27 per cent, and the average wages in all industries increased 12 per cent. The payment of a bounty on the exportation of sugar caused production to increase from less than 200,000 tons in 1871 to more than 1,000,000 tons in 1891. There was activity in all employments. Machinery improved and skill increased. Wages, tho from 98 to 226 per cent higher than in 1848, were still so much lower than in England that German goods found an increasing market there, to the depression of many British industries and to the ruin of some, and they were even able to overcome many of the duties of the U. S. and undersell the products of some of the best established industries in this country. From 1875 to 1886 the exports of manufactures of silk increased 884 per cent; woollens, 296; cottons, 302; glass, 264; paper, 322; spirits, 258; beer, 446; and machinery, 260 per cent. Industries became diversified as never before in any country, and from 1878 to 1896 schools for technical and manual training were established in 328 places. All these mar-

Protection in Germany

velous figures utterly disprove the theory of free trade that protection dulls and dwarfs the individual and cramps and curtails the aggregation. On Dec. 25, 1902, the agrarians having obtained ascendancy in the Reichstag, duties were raised on most farm products, dressed meats, live animals, lumber, shoes, sewing-machines, electrical machines, machine tools, automobiles, and railway cars, to go into effect in 1906, but subject to be reduced by treaty. Treaties were made with seven European countries and a provisorium with the U. S., which has been followed by a compact liberalizing our administrative customs practices, so that the higher duties are not yet levied on goods from this country. Germany's industrial progress has continued, and there is very little desire among her people to introduce free trade.

Russia, the wonderland of two continents, affords a most striking example of the influence of protection to convert barbarism into civilization and transform deserts into cities and gardens. Russia entered upon its career as a modern power with the reign of Peter the Great, which began in 1689. That enlightened monarch worked incognito in the shipyards of Holland, that he might

Protection in Russia

teach his people how to build ships. When he visited England, the tendered kingly honors, he took private lodgings and studied the laws and industries. The "dropping pearls and vermin," and leaving evidence in his lodgings that "a barbarian had been there," he took away about all that was to be learned, at that time, of national development. This knowledge was applied at home under the disadvantages of popular ignorance, but in a thousand ways Russia was transformed. Agriculture, manufactures, and commerce became established. In treaties and decrees the protective principle was carefully observed. Near the close of the seventeenth century, or contemporaneously with the U. S., Russia adopted a tariff of protection, and in many cases of prohibition. Again, as in the U. S., this policy was relaxed in 1816-19, but returned to in 1822 and maintained until 1849. In the revisions of 1851 and 1854 prohibitions were generally abolished and the duties made discriminating, as suggested by economic changes. The same policy was adhered to in the revisions of 1867 and 1876; the last increasing the protection. A new revision, on the same lines, was begun in 1887 and completed in 1891. In these later and scientific tariffs Napoleon's idea of subordinating revenue to protection prevailed. The general results of a century of protection were progress in every domestic industry, a favorable balance of trade, and a steady gain in employment and wages. In 1894 Russia produced nearly two billion bushels of grain and more than one and a quarter billion pounds of cotton. In 1890 the output of the mines and factories was valued at \$828,000,000. Of the European countries, Russia is second to only England in cotton manufacturing; having 6,000,000 spindles in 1892. Woolen, silk, leather, lumber, flour, and tobacco are all important and growing industries. In 1895 there were 65,000 factories of all kinds, employing 1,000,000 people. From 1884 to 1896 the sugar industry increased 100 per cent; iron, 68; steel, 59; coal, 129; and petroleum, 1,475 per cent. Wages have advanced, but are still low; being from \$80 to \$150 a year for men in the cotton-mills, and but a trifle more than half that for women. Most of the mills are run from nine to twelve hours a day.

During the decade ending with 1906, the greatly disturbed by revolutionary outbreaks, which often took the form of labor difficulties, but which were more political than industrial, and so much retarded by the costly war with Japan, Russia continued to develop. Her manufactures became more varied and extensive, and in 1903 Minister Witte reported a heavy fall in prices "as a consequence of increased competition among producers," and that this was "the very object of our protective policy, i. e., the provision of the country with cheap manufactures of home production." In 1904 the chief articles of import were: foods, \$46,000,000; raw materials for manufactures, \$166,000,000; finished goods, \$78,000,000. The greatest trade was with Germany, France, Great Britain, and the U. S., in the order named, but the internal trade was greatest of all.

Other Europe.—The progress of other European countries under protection compares favorably with that of the great countries named. Apparently protection is their settled policy. Spain has recuperated rapidly from the losses caused by the war with the U. S., and her manufactures are increasing. The loss of her colonies seems to have been more than compensated by the \$20,000,000 received as the price for the Philippines and by the policy of self-reliance and home improvement, resulting from self-respect, emulation, and protection.

Prior to the formation of the Dominion of Canada in 1867 the several provinces had protective tariffs. The need of a uniform system was one of the causes of union, as it was in the U. S. In 1879 the Dominion Parliament enacted a protective tariff

British Provinces

which became known as the national policy. Under it the country prospered and a great variety of manufactures was introduced. Both parties actually favored it, for altho the Liberals had advocated partial free trade, on assuming power in 1897 they made no important changes in the law except to admit imports from British countries under a preference of 12 per cent, which was soon raised to 25—and later to 33½. This was partly in pursuance of a policy discussed in a colonial conference which was held in Ottawa in the summer of 1894 and was attended by delegates from the imperial government, New South Wales, Cape Colony, New Zealand, Victoria, Queensland, and Canada. This was the first practical step taken toward imperial federation. In 1906, after a commission of Parliament had conducted hearings in all the provinces, a new tariff was enacted which it is believed will prove quite as protective as the one it displaced. To be sure it contains a new feature, called the intermediate tariff, with rates about one half way between those of the general tariff and the British preferential, which the governor in council may apply to imports from countries not entitled to the preferential, "in consideration of benefits satisfactory" to him. This is spoken of as a reciprocity feature, but the inducement has not attracted other countries to date. Another feature of the Canadian tariff is a surtax of one third which the governor in council may add to the general tariff on goods "from any foreign country which treats imports from Canada less favorably than those from other countries." This has been applied to German goods. Still another comparatively new feature is an antidumping clause, which authorizes the governor in council to add a special

duty not exceeding 15 per cent to goods with a few exceptions which are sent to Canada at a price below the fair market value when sold for consumption in the country of their production. This is decidedly a protective feature and it is said to work well. There is no little dissatisfaction in Canada with the British preferential, especially among woolen manufacturers, many of whom it has driven out of business, but others accept it as a tribute of loyalty and indulge a hope that the United Kingdom will soon become protective, in which event Canadian products will have an advantage there over those from other countries. Despite the preference, however, during the fiscal year ended March 31, 1907, the increase in Canada's trade with the U. S. was much more than double the increase with Great Britain, which is mainly due to the convenience of proximity. Not only is the domestic trade of the Dominion highly prosperous under protection, but its foreign trade grew in imports in the last six years from \$181,000,000 to \$290,000,000 and in exports from \$177,000,000 to \$235,000,000. The dutiable imports from Great Britain in 1906 were \$52,000,000, and from the U. S., \$89,000,000.

Protection and free trade were tried side by side in Australia before the formation of the Commonwealth in 1901. The province of Victoria had a protective tariff and New South Wales a free-trade tariff. Government reports in 1897-98 showed that while Victoria was smaller in area and population, she made greater progress than New South Wales in productive industries, in intercolonial traffic, in savings-banks and deposits, in public education and the diffusion of wealth, while her annual expenditures were less by £5 per capita. Her success went far to determine the policy of the new union, which adopted protection and has steadfastly maintained it. The country as a whole and the several states have prospered, but chiefly by reason of the mineral output and the revival of sheep husbandry, for manufacturing has been delayed by the prevalence and the high cost of municipal ownership, which has made capital timorous, the rate of interest high, and caused a condition of uncertainty. Imports in 1903 were £37,000,000 and exports £57,500,000. The U. S. has a growing share in this trade, altho lacking regular steamship lines to compete with those of France, Germany and Great Britain.

The tariffs of most of the other British colonies are chiefly for revenue, but not being limited to such articles as the colony cannot produce, they operate to protect such natural industries as exist or may be started.

II. Protection in the United States

The agitation for protection began in the colonial period, partly because of England's oppressive laws to prevent manufacturing in the colonies, and partly because of the depression of industry from the use of foreign goods. In 1767 the inhabitants of Boston voted in town meeting and afterward signed a pledge not to buy the "foreign superfluities" mentioned in a long list. The Articles of Confederation, under which the country was governed from 1781 until the ratification of the Constitution in 1787, permitted each state to regulate its own commerce, and this made a general tariff impossible. The states were deluged with foreign goods. Distress

working men and merchants in the principal cities united in great petitions for protection. To meet this want was one of the chief reasons (Daniel Webster said it was "the leading cause") for forming the "more perfect union" spoken of in the preamble to the Constitution. The second act of the First Congress which assembled under the new Constitution was a tariff, the object of which, as declared in the preamble, was "for the support of government, for the discharge of the debts of the U. S., and for the encouragement and protection of manufactures." This passed the House by a vote of more than five to one, and the Senate by a unanimous vote, and was approved by George Washington, July 4, 1789. From that time to 1907 fifty-one general tariff laws were enacted, all of them in some degree protective. There was no departure from the protective policy until 1816, and the new duties of that year were intended to be ample, but they proved insufficient against the destructive commercial war which England determined to

Early History

wage. In a speech in Parliament Lord Brougham declared that "it is worth while to incur a loss upon the first exportation, in order, by the glut, to stifle in the cradle those infant manufactures in the U. S. which the war has forced into existence." While in 1813 imports were only \$13,000,000, in 1818 they had risen to \$121,750,000. An adverse balance of trade of \$29,000,000 had been created, and industry was everywhere depressed. In 1824 a more protective tariff was passed, and it was strengthened in 1828. Under both tariffs the country prospered. But meanwhile the tariff had become a sectional question. The cotton-planters of the South, whose principal market was in England, were led to adopt the free-trade ideas of Richard Cobden, John Bright, and later of Sir Robert Peel, and under the lead of Mr. McDuffie, of South Carolina, they advanced the strange theory that, by selling cotton to be manufactured in England, they were manufacturers themselves, and as much entitled to government favor by exemption from duties on the imports with which they were paid as the cotton manufacturers of New England were by the imposition of duties upon competing goods. Resentful of Northern hostility to slavery, they favored England instead of New England; reasoned that protection is paternalism; decried the tariff as "a local question," and threatened to secede from the union. Wishing to avert this calamity, Henry Clay, the greatest of the protective statesmen except Daniel Webster, proposed a compromise tariff, which became a law in 1833, which took the form of a sliding scale of biennial reductions to uniform duties of 20 per cent, to be reached in 1842. Of course, such disregard of discrimination which varying costs of production require in a protective tariff, as well as the lower duties, proved disastrous to both revenue and business, and this, complicated with a banking question, produced a great panic in 1837. In the tariff of 1842 the country returned to protection, but in 1846 the South again prevailed, and the "Walker tariff" of that year made heavy reductions in the duties that protected manufactures. The disastrous effects were referred to by Presidents Fillmore in 1852 and Buchanan in 1857, but owing to causes other than the tariff, the country enjoyed some measure of prosperity. Those causes were admirably stated by Mr. Blaine in his "Twenty Years of

Congress." When those causes ceased to operate a panic ensued in 1857, and in 1861 the "Morrill tariff," which returned to protection, was enacted a short time before the outbreak of the Civil War. During the war many duties were increased, the prime object being revenue, because the war itself proved a great stimulus to industries. When peace was restored free traders raised a clamor for the abolition of the war tariffs. Changes were made in 1867, 1870, and 1872, most of which were extensive reductions. Importations, which had already become large as a result of extravagance, incident to an inflated currency, then increased, the country had an adverse balance of trade, and in 1873 there was another panic. In 1875 a more protective tariff was enacted and prosperity returned. In 1883 what was supposed to be a scientific readjustment of duties, recommended by a commission of experts, was made, but economic changes which they did not anticipate caused it practically to fail, like the tariff of 1816. Again business suffered, but the McKinley tariff, of more discriminating duties, and improved administrative features, was enacted in 1890, and during its three years' operation both production and commerce prospered as never before. More people were employed, and at higher wages, the public debt was reduced \$252,000,000, new industries sprang into existence, there was a favorable balance of trade, the public credit reached its highest figure. But the extensive free-trade propaganda denounced the duties as excessive and misled enough voters with the false statement that "prices had advanced all along the line," to reverse the policy at the next elections. The Democratic Party promised to introduce free trade, but its candidate promised that nothing should be done to hurt the industries. Both promises failed. The Wilson Bill of 1894 did not even pretend to frame schedules on free-trade principles; it was simply a reduced McKinley tariff, but so much reduced that Southern senators from coal- and iron-producing states refused to accept it, and raised certain rates. President Cleveland denounced this as an act of "perfidy and dishonor," and allowed the bill to become a law without his approval. Some of its duties proved fairly protective; others invited increasing imports, and when the market became flooded with foreign goods, domestic industry collapsed. A deficiency in revenue, coupled with an intimation by a Secretary of the Treasury, with an unsound financial record, that public obligations might be paid in depreciated silver, caused a panic in the early summer of 1893, and tho that was soon over, there was no general prosperity until the Republicans were restored to power in 1896 and the Dingley tariff was enacted in 1897. The public debt was increased by nearly \$300,000,000, the public credit fell to a humiliating figure, there was an adverse balance of trade, unemployment increased in nearly all industries, wages fell, trade declined, general discontent prevailed, and the shrinkage in values of property during the four years totaled more than the money cost of the Civil War.

The tariff act of July 24, 1897, called the Dingley Law, in honor of its principal framer, former Governor Nelson Dingley, Jr., of Maine, who was then chairman of the House Committee on Ways and Means, employed the same schedules as were in the tariffs of 1890 (McKinley

and 1894 (Wilson), but changed many of the rates and classifications. Some of the duties are lower than those of 1890, and most of them are higher than those of 1894. Its free list is larger than either of the others. The average ad valorem rates on all imports were: McKinley tariff, 24.73 per cent; Wilson, 20.76; Dingley, 26.78. The duties per capita were: McKinley, \$2.42 a year; Wilson, \$2.19; Dingley, \$3.02. Even the last is so small that the tariff would never be complained of as a tax if it were not for the belief, erroneous in most cases, that the duty is added to the cost of domestic as well as imported goods. It is not added to either when there is unrestricted domestic competition, unless, as sometimes happens, and which is the case in 1907, the demand is greater than the supply. Under any tariff it is the law of demand and supply which determines prices. To be sure, it is said that certain trusts have monopolized supply and fix prices at an abnormally high figure. There is but a small measure of truth in this, and it is the same under free trade as under protection. (See vol. 18, U. S. Industrial Commission's Report, 1902, and No. 288 of Monthly Consular Reports, 1904.) This being so, it is not true that trusts are caused by protection, or that repealing protection will abolish trusts. When trusts are international, like the Thread Trust and the Borax Trust, it has not yet been pointed out how a change of duty can compel them to change the price, altho it is easy to see how it might cause them to close their American mills and supply us wholly from abroad.

That there was an increase in prices in the decade from 1897 to 1907 of about 50 per cent is true, but prices had become abnormally low under the Wilson Law, hence what they were in 1897 is not a fair standard. A fairer comparison is between the last seven years and a period of twenty years before 1890. Dun's index number

Duties Not the Cause of Higher Prices

shows that the first of January prices for a year's necessities averaged in the earlier period \$100, 54 cents and 8 mills, and for the latter only \$90, 69 cents and 1 mill. This proves that under the development and economies of production incited by protection the tendency of prices in long periods of time is downward. But should it still be thought that a comparison with the Wilson period is fair, another factor is to be considered and that is the gain in the production of gold and in our money in circulation. During seven years before 1900 the average U. S. production of gold per capita was 74 cents, and since 1900 it has been 120 cents, an increase of 62 per cent. The money in circulation in the former period was \$23.82 per capita and in the latter period \$29.57—a gain of more than 24 per cent. Economists of all schools recognize that the more gold there is and the more money in circulation, the higher must be the prices of commodities measured by these standards. Taking this into account and also the extraordinary demand for all products owing to a high state of prosperity, it cannot be said that prices are excessive.

Unexampled Prosperity

In all the industries there have been repeated increases of wages, nearly or quite equal to the advance in prices, and as labor is fully employed and the demand greater than the supply, it is doubtful if the industrial population ever before enjoyed equal prosperity. June 30,

1906, there were 8,027,192 depositors in the savings-banks, and the average deposit was \$433.79—gain of more than 600,000 depositors in a year and of more than \$10 each—a gain of more than 1,000,000 of depositors since 1896 and of \$51.71 the average deposit. What more conclusive evidence could there be of general thrift and of conditions which permit accumulation? In all things respects the progress of the people in the Dingley period has been unprecedented in this or any other country. Lands have been drained, irrigated, and fertilized; buildings and machinery improved and increased, many thousands of miles of permanent roads built, most of the older cities extensively rebuilt, railroads and railways extended, double-tracked, and electrified as never before, motor boats and carriages introduced, mines and quarries and factories enlarged and increased in number, schools and religious and charitable institutions built, improved, and paid for, islands acquired and helped with a generous hand, a powerful navy and hundreds of public buildings built, mortgages paid, municipal and national debts reduced, and the total wealth increased from \$77,000,000,000 in 1895 to \$108,000,000,000 in 1905.

Meanwhile foreign commerce has enjoyed a corresponding growth, to the confusion of those who believed that protection was calculated to cripple it. As a whole it increased 71.2 per cent from 1895 to 1905. Imports increased 52.7 per cent and exports 88 per cent, thus giving the country a handsome merchandise balance of trade. A lesson is found in an analysis of this commerce.

Growth of Foreign Commerce Also

While imports of food and live animals grew only 16.9 per cent, showing the adequacy of our home supply, and finished goods for consumption increased only 19 per cent, crude articles for domestic industry increased 93.3 per cent and articles wholly or partially manufactured for use as materials in mechanic arts increased 72.4 per cent, showing the scientific adjustment of the tariff to the promotion of domestic manufactures. At the same time imports of articles of voluntary use, luxuries, etc., increased 57.8 per cent, showing that the duties are anything but prohibitory and that the forehanded classes must have enjoyed good incomes from investments in domestic industry to enable them to purchase so many imported luxuries. At the same time our exports of agricultural products grew 48.4 per cent and of domestic manufactures 196.1 per cent, which has a healthy look. Other exports increased as follows: mining products, 175.4; forest products, 117.4; fisheries, 35.9; and miscellaneous, 66.4. The statistics of the Department of Commerce and Labor show that our trade increased with all the grand divisions of the world and that our exports to Europe increased 62.6 and to North American countries 140 per cent.

During 118 years the U. S. has had about eighty years of effective protection. In every protective period it prospered. In every free-trade or compromise period there was business distress. Every period of excessive foreign buying ended with a crisis. Even before the Dingley triumph, the U. S. had become first in agriculture, first in mining, and first in manufactures, and its population is the best conditioned of any in the world.

In view of all this, people who believe that protection is needed for only "infant industries" now very naturally inquire if the time has not

come when it can be dispensed with. If our industries have become giants, so have their foreign competitors. Alexander Hamilton stated in his Report on Manufactures in 1791 that the freight charges on goods from Europe to America at that time ranged from 15 to 25 per

Modern Conditions

cent of the cost of the goods. In these days of 20,000-ton steamships, one cargo from which will load ten miles of freight-cars, the cost of ocean freight is often less than 1 per cent of the value of the goods. The cost of transportation therefore no longer protects. Besides, Germany and France, which own railroads, make rates on goods for export at one half their rates on goods for home distribution. Moreover, many European manufacturers combine to capture foreign markets and pool the losses sustained in cutting prices to accomplish that purpose. These are wholly new and powerful conditions which prove the necessity of continuing protection by tariffs. Furthermore, while many industries have grown great, there are always new or infant industries. It is necessary that they should be protected in order that there may be domestic competition. And as the Constitution requires that duties shall be uniform throughout the U. S., protection cannot be withdrawn from one establishment and kept for another in the same line of business. The tariff that protects trusts cannot be abolished without destroying the domestic competitors of trusts and playing into the hands of foreign trusts. The advocates of repealing or greatly reducing duties fail to take note of these facts and when they talk about "adapting a tariff to changed conditions" they never recognize the necessity of raising as well as lowering duties, to meet new forms of foreign aggression. When they think of Japan as a modern military power they readily assent to large appropriations for a powerful navy, and yet they fail to see the greater danger to American labor in the fact that Japan is rapidly becoming a first-class manufacturing nation, with wages below forty cents a day, and that it costs less than four mills a yard to bring cotton cloth from Osaka to New York.

III. The Principles of Modern Tariffs

These are easily understood. The difference between a free-trade tariff and a protective tariff is not so much one of low or high duties as it is the choice of articles to which duties shall be applied. Britain's free-trade tariff raises more revenue per capita than the protective tariff of the U. S. raises. But free trade applies duties to articles which must be imported, because they are wanted and are not produced in the country; protection admits such articles free, so as to cheapen their cost, and applies duties to articles which do not need to be imported, because they are or can be produced in the country. Britain derives a large revenue from tea and coffee, not a pound of which is raised at home; the U. S. has admitted them free of duty since 1872. Britain admits cotton and woolen goods free, altho producing them; the U. S. subjects them to duty, so that more of them may be produced here. If Britain's need of revenue requires a duty to be placed upon an imported article like what is produced in the country, an excise is put upon the domestic product to counterbalance the duty, so that the duty will not be protective. In the U. S., if duties fail after due trial to develop a domestic supply in quantities adequate

to reduce the price to a fair level, they are removed, so as not to increase the cost of living. It is claimed by protectionists that the duty is not added to the price, except when the people are dependent upon foreign supply. When they are not dependent the duties on goods sent here to compete are paid by the foreigners in form of a lower price. This claim is not only admitted by exporters to protective countries, but is proved by prices, most of which are as low as those abroad, all of which are lower after than before protection, and many of which are actually lower than the duties themselves. In the last case the duty might be dispensed with, but it does no harm to consumers and protects producers from bankrupt stocks or from the destructive prices that Lord Brougham advised to make and that combinations of European manufacturers now make on exports.

There has been much misleading talk about "high tariff" and "low tariff." A tariff may be very high and yet not in the least protective, or very low and yet sufficiently protective. All this depends upon the objects to which duties are applied and the conditions of production and distribution. And since the duty cannot be added to the price when there is strong domestic competition, no consumer need care how high it is. But if it falls below the line of protection, domestic competition is crushed, and then the importer can add the duty to his price. In countries of comparatively small population low duties are quite as protective as high duties in the U. S., because there is not the same pressure to gain the market.

Under both free trade and protection duties are either specific or ad valorem, and sometimes both. A specific duty is so many cents per pound or yard, or other unit of quantity. An ad valorem duty is such a percentage of value. The former requires only counting or weighing at the customhouse, but the latter requires appraisement. It is difficult to ascertain the value of foreign goods, and they are often invoiced far below their true value, so as to cheat the customs and enable the importer to undersell others in the market. This deprives the Treasury of part of its expected revenue and deprives domestic producers of a part of their promised protection. The tariffs of all foreign countries are now almost wholly specific. In America protectionists favor specific duties, but free traders generally favor ad valorem.

The effect of tariff upon wages has long been a subject of dispute. Perhaps the most accurate

statement is that they neither raise nor lower wages except as they increase or diminish employment. If the goods we consume are made abroad, we do not make them ourselves, therefore labor suffers. Wages in Europe

average from one fifth to two thirds those in the U. S.; in India, China, and Japan, from one tenth to one fifth the rates paid here. These comparisons are based on the relative productivity of labor and machinery. And as the cost of ocean transportation is now but a small percentage on the cost of the goods, the only way to secure employment and good wages in this country is to have duties that will at least equal the difference in the labor cost of production in general industries between those countries and this. Thus the tariff question is largely a labor question. It is often contended by free-trade advocates that the ability of a U. S. manufacturer to export to Europe at a profit proves that he no longer

needs protection. If this were true of a few which is doubtful, it is not true of the 500,000 manufacturers of this country. Our exports of manufactures in 1905 were only 9.11 per cent of the whole product, and most of the export is due to some peculiarity of make or material, which foreigners soon imitate or equal. Foreign markets are hard to gain and hold, even with superior goods produced at lower cost, as may sometimes but rarely happen. All our gains in foreign markets do not equal the growth of the home market, and the greater should not be endangered for the less.

ALBERT CLARKE.

PROTESTANT EPISCOPAL CHURCH AND SOCIAL REFORM (for a statement of the activities of the Protestant Episcopal Church in social reform, see CHURCH ASSOCIATION FOR THE ADVANCEMENT OF THE INTERESTS OF LABOR; CHRISTIAN SOCIAL UNION; INSTITUTIONAL CHURCHES): The Protestant Episcopal Church probably leads the religious societies of the United States in its activities in social reform. The existence of the above-mentioned societies, the activities and utterances of such men as the late Bishop Huntington of Central New York, Bishop Potter of New York, Bishop Sessums of Louisiana; with such clergymen as the late William Augustus Muhlenberg, D.D.; Rev. W. S. Rainsford, D.D.; Rev. R. Heber Newton, D.D.; Rev. R. H. Holland, S.T.D.; Rev. James Huntington, O.S.; Rev. J. D. Peters, D.D.; Rev. W. D. P. Bliss; Rev. Philo Sprague; with such laymen and women as Professor Ely, Miss Vida D. Scudder, and many others, go far to substantiate this view. Referring to the above-named articles for details, we give here a significant extract from the pastoral letter of the bishops of the Church in 1889:

In a country such as ours, distinguished among the nations by institutions which presuppose the liberty, intelligence, and civic virtues of the citizen, it is of the utmost importance that men should feel and recognize their political responsibility. And while the Church of God—the kingdom not of this world—does not undertake to wage the warfare of the partizan, it is nevertheless charged with the duty of establishing and maintaining principles which shall find expression in the political as well as in the social and family life. The Incarnation would be emptied of a large part of its sig-

finance if it were supposed to leave untouched and unimpaired the life of men under the ordered polity of the commonwealth. To render unto Caesar the things that are Caesar's is surely more than the due payment of the tribute money which supports the public action of the State. It is, less, the righteous and godly exercise of all the functions of the citizen. On account of the dangers which beset all government, the far-seeing founders of the republic rested their hopes for its welfare and success upon the civic fidelity of the people—not upon the excellence of our governmental methods. Those methods make possible among us gross and shameful perversions of political right and authority. It has come to pass, in the heat and eagerness of party struggle, that vicious and corrupt conduct is largely condoned, and the standards of political morality are sensibly and dangerously lowered. We are confronting a great peril—and one which must excite the fears of Christian men—lest character fashioned in the working of free institutions be irretrievably damaged, and the poison, entering here, spread itself throughout the entire life of the nation. Purity and integrity in the administration of public affairs are strenuously demanded by the religion of Christ, as well as by all patriotic aspiration. Official place, in morals and in politics, is not the prize won by vulgar selfishness, nor the refuge of patronized incompetence, nor yet the barter price promised or paid for political influence, but the place in which a righteous man may serve his fellow men and advance the reputable interests of his country. The emoluments of office are derived from a fund contributed to the State by the loyal obedience and patient toil of the industrious masses; to say the very least, it should be distributed so as to secure the most efficient and economical conduct of public affairs. The honors of office are legitimate rewards bestowed by popular confidence upon upright citizenship. It must be an evil day for our country when both emoluments and honors are made the prey of a partizan activity which often discards all honesty in its methods, and renounces all shame in its corrupt and corrupting success. The religion of Christ is "for the healing of the nations," sick with sin and wrong; and the Church of Christ, while holding itself aloof from the strife of faction and party, is yet called upon, in the persons of its members, to guard jealously the great heritage which God's providence has bestowed, and to maintain earnestly the beneficent ideals of political life and action. To answer that call with ready mind and will is the becoming office of faithful men who would promote the righteousness which "exalteth a nation," and invite still further blessings from Him who "hath brought us forth into a wealthy place" among the peoples of the earth.

Morals

We pass on to a kindred topic. It is inevitable that the Church of God shall be profoundly concerned at the disturbed relations of what are commonly called the "industrial classes"—the wage-workers and the employers of human labor. The spirit of our holy religion forbids indifference, on our part, to any actual trials, oppressions, or sufferings of men, and its due practical operation has tended always to do away with jealousies, suspicions, and antagonisms between the children of the one Father of us all. We may confidently claim for the Church of Him who by His presence consecrated the carpenter shop of Nazareth that, however, at any time or place it may have been tempted to shelter itself under the patronage or protection of earthly power and wealth, nevertheless its deep, constant purpose has been to soften asperities of feeling, to promote mutual good-will, to curb injustice, as between man and man. And if there be, as unhappily there often is, a forgetfulness by many of the blessed changes wrought in human conditions by Christ's religion, we may not ignore the significant truth that the unchallenged claim of men of our day to considerate justice and all righteous recognition by their human brothers rests finally and completely upon the dignity and sacredness of the humanity taken into the Godhead by the Word made Flesh, and by Him redeemed unto the liberty of the children of God.

It is painfully evident that the existing industrial system is subjected not only to vehement criticism, but to perilous strain; and one of the most discouraging elements of the situation seems to be the hopeless or despairing tone of those who deal with the overshadowing questions which throng so persistently upon the mind and heart of our generation. It seems scarcely to be expected, by many, that a solution of the problems can be reached by applying to them any devices of human sagacity or any reconciling principles of economic science. It is often assumed without question, alike by reckless passion and thoughtful earnestness, that there is no soothing for the uneasy world; that opposing interests and aims are here met in mortal strife. We do not venture to intimate that we have any swift and potent cure for the evils which we must and do deplore. But we are confident that it is a fallacy in social economics, as well as in Christian thinking, to look upon the labor of men, women, and children as a mere commercial commodity to be bought and sold, as an inanimate and irresponsible thing. It is the employer who seeks and finds the inner soul of the operative, who respects his manhood, and perhaps translates for him into fact the inarticulate longings of his better nature; it is the master whose watchful sympathy finds room and play in the cottages of his wearied workmen, and in all the life which has its centers there—it is

he who has found the open secret of a wisdom that is "peaceable," because it is "from above," and is "pure," "gentle," and "easy to be entreated." Any social philosophy which eliminates from its consideration the value and significance of human feeling or human susceptibility to the influence of kindness, justice, and loving manliness has surely left itself fatally maimed and incomplete. The heart and soul of a man cannot be bought or hired for money in any market, and to act as if they were not needed in the doing of the world's vast work is as unchristian as it is unwise. We may not therefore omit to urge upon all those to whom our words may come, the profound need of a righteous and full appreciation of the moral and spiritual factors which enter into industrial questions. To bear in mind the hardships and heavy cares of our brother men; to remember our common kinship in the great family of God; to ponder their necessities; to stand ready and glad to plead their cause; to brighten their lot and comfort their distresses—this is the exalted office of Christian men—it is the hopeful method of peace and good-will. And let it never be forgotten that there is here a reciprocal obligation laid upon labor—a duty defined by every principle of righteousness and truth. That duty—a duty fully and fitly recognized by large numbers of Christian working men—plainly is to treat the employer, in his most difficult position, with all considerate and thoughtful regard. His legitimate interests may not be ignored, and it should be the steadfast will and purpose of his working associates to protect those interests and defend them against all unjust aggressions. He is frequently placed in situations of great embarrassment, and the kindly patience and sympathy of his workmen may bring relief. He is always entitled to that, and there is grave injustice when it is withheld. Combinations which cripple or hinder his rightful freedom of action, unreasonable demands concerning the hours and compensation and division of labor—these are not in the way of substantial right, and any temporary or passing triumph for them is but the delusive promise of a method bad in morals, which really invites and compels disaster. The stars in their courses through God's sky of truth fight against ungodliness and wrong, and they who would claim equity must do equity. In considering these relations between employer and employed, we desire to express our profound interest in the provisions that may be and should be made for penetrating the life of the great masses of men with positive Christian influence. If the world's exacting labor is to be done in any accord with the principles of the kingdom of God, there must of necessity be, on the part of employers, a distinct and unqualified recognition of the spiritual needs and claims of the workmen whose toil they control or direct.

Wage
Question

In the law of God there is a day which He calls His own, and by the declaration of the Lord Jesus Christ it was "made for man." It is doubly protected then by the sovereignty of God and by the everlasting sanctity of a human right; the Holy Day—thus guarded and shielded against invasion—is the day for worship and for rest. To rob it of its character at the demand of greed; to make labor so weary under its daily burden that it is tempted and almost forced to change its day of high and holy refreshment into a day of reckless indulgence or soulless apathy, is grievous sin. We are enabled to thank God for the good examples of some of our brethren who have been forward to minister graciously and helpfully to large bodies of operatives in their employ. They have provided for needed rest, for helpful and elevating recreation, for due demands of human frame and human spirit. Let the examples be multiplied, and let the Church of God interpose its protest against oppressive wrong.

Since this pastoral letter was written, the Church has greatly extended her activities in various ways along lines of social reform. A recent report ("Church Philanthropy in New York," by Floyd Appleton, Ph.D., 1906) enumerates among remedial institutions six hospitals, besides numerous clinics and dispensaries—six for the incurable, blind, and deaf; thirteen for the aged and orphaned; five for the delinquent—aside from a large number of local and smaller institutions. The Church has done as well in other parts of the country in proportion to her means and membership.

Officially, the Church has reiterated, emphasized, and clarified her position in various pastoral letters, both on the part of the House of Bishops and of individual bishops. At the recent general convention at Richmond, Va. (Oct., 1907), the report on "Capital and Labor" recommended a more intelligent study of these questions; deprecated the ignorance of clergymen of the real issue, and that of laboring men concerning the true mission of the Church;

deplored the employment of children in mills and factories; urged the coordination of the various existing societies within the Church under a central committee; and called for systematic efforts to arouse interest in these matters on the part of Church people in general.

The convention adopted the report, and created a permanent Committee on Capital and Labor with authority to speak in the name of the Church in these matters. *Secretary*: Rev. Edward L. Parsons, Berkeley, Cal.

PROUDHON, PIERRE JOSEPH: French philosophical anarchist; born 1809, Besançon, France. He early displayed a love of study, and, borrowing books from the town library, he read, and went to the day-school when his work allowed. At sixteen he entered the college of his native place; but could not buy the necessary books, and had to borrow them from his mates in order to copy the lessons. There is a story of young Proudhon returning home laden with prizes, to find that there was no dinner for him. At the age of nineteen he worked in a printing-house, correcting proof, and acquired knowledge on many lines, particularly in theology; learning Hebrew, as well as Greek and Latin. He was thus enabled to contribute some articles to an "Encyclopédie Catholique." In 1836 he established a small printing-office in Besançon, but, his partner committing suicide, he had to wind up the business in 1838. In 1837 he had written an "Essay on General Grammar," and obtained a pension of 1,500 francs. This enabled him to go to Paris and to compete for a prize essay on the subject of "The Celebration of Sunday," in which he first broached liberal social ideas.

In 1840 he published his first work, "Qu'est-ce que la Propriété?" giving his famous answer to the question, "La Propriété, c'est le Vol" (Property is Theft). It attracted little notice; the sole results to its author were the withdrawal of his pension by the Academy, and the threat of a prosecution. In 1842, for a repetition of offense in his "Avertissement aux Propriétaires," he was prosecuted before the Cour d'Assises of Besançon, but was acquitted. From 1843 to 1847 he was employed at Lyons, in the superintendence of a scheme of water-transport on the rivers Saône and Rhône, publishing during this time at Paris the two works entitled "De la Création de l'Ordre dans l'Humanité" and "Système des Contradictions Économiques," his most important works, and written under the influence of Hegel, Adam Smith, and the Bible. In 1847 he finally settled in Paris, where he was becoming celebrated as a leader of innovation. The revolution of February (1848) found the social reformers unprepared. But Proudhon threw himself with ardor into the conflict of opinion, and gained national notoriety. He was editor of the *Représentant du Peuple* and other journals, in which the most advanced theories were advocated; elected member of Assembly for the Seine department, by 77,094 votes, he brought forward a proposal to exact an impost of one third on interest and rent, which was rejected. He had various struggles with the Mountain and other political factions, whom he accused of favoring socialism only in pretense. He fought a duel with Félix Pyat and denounced Louis Bonaparte, who was already preparing his *coup d'état*. For this he was condemned to a fine of 10,000 francs and three years' imprisonment, and fled to Bel-

gium. Proudhon only remained in Belgium a few days, and returning to Paris in disguise, was discovered, and imprisoned three years. He wrote during these years his "Confessions d'un Révolutionnaire" (1849), "Actes de la Révolution" (1849), "Gratuité du Crédit" (1850), and "La Révolution Sociale Démontrée par le *Coup d'État*." In June, 1852, he was set at liberty, and lived, writing, in comparative quiet, till the publication of his work, "De la Justice dans la Révolution et dans l'Eglise" (1858), in which he attacked the Church and other existing institutions with unusual fury. This time he fled to Brussels to escape imprisonment. On his return to France his health broke down, tho he continued to write. Died at Passy, 1865.

Thomas Kirkup says of Proudhon (article "Proudhon," "Encyclopædia Britannica," 9th. ed.):

Personally Proudhon was one of the most remarkable figures of modern France. His life was marked by the severest simplicity and even Puritanism; he was affectionate in his domestic relations, a most loyal friend, and strictly upright in conduct. He was strongly opposed to the prevailing French socialism of his time because of its utopianism and immorality; and, tho he uttered all manner of wild paradox and vehement invective against the dominant ideas and institutions, he was remarkably free from feelings of personal hate. In all that he said and did he was the son of the people, who had not been broken to the usual social and academic discipline; hence his roughness, his one-sidedness, and his exaggerations; but he is always vigorous, and often brilliant and original.

It would, of course, be impossible to reduce the ideas of such an irregular thinker to systematic form. Yet the

groundwork of his teaching is clear and firm: no one could insist with greater emphasis on the demonstrative character of economic principles as understood by himself. He strongly believed in the absolute truth of a few moral

ideas, with which it was the aim of his teaching to mold and suffuse political economy. Of these fundamental ideas, justice, liberty, and equality were the chief. What he desiderated, for instance, in an ideal society was the most perfect equality of remuneration. It was his principle that service pays service; that a day's labor balances a day's labor—in other words, that the duration of labor is the just measure of value. He did not shrink from any of the consequences of this theory, for he would give the same remuneration to the worst mason as to a Phidias; but he looks forward also to a period in human development when the present inequality in the talent and capacity of men would be reduced to an inappreciable minimum. From the great principle of service as the equivalent of service is derived his axiom that property is the right of *ousbois*. The *ousbois* was a stranger not naturalized; and the right of *ousbois* was the right in virtue of which the sovereign claimed the goods of such a stranger who had died in his territory. Property is a right of the same nature, with a like power of appropriation in the form of rent, interest, etc. It reaps without labor, consumes without producing, and enjoys without exertion. Proudhon's aim, therefore, was to realize a science of society resting on principles of justice, liberty, and equality thus understood; "a science absolute, rigorous, based on the nature of man and of his faculties, and on their mutual relations; a science which we have not to invent, but to discover." But he saw clearly that such ideas, with their necessary accompaniments, could only be realized through a long and laborious process of social transformation. As we have said, he strongly detested the prurient immorality of the schools of Saint-Simon and Fourier. He attacked them not less bitterly for thinking that society could be changed offhand by a ready-made and complete scheme of reform. It was "the most accurate lie," he said, "that could be offered to mankind." In social change he distinguishes between the transition and the perfection or achievement. With regard to the transition he advocated the progressive abolition of the right of *ousbois*, by reducing interest, rent, etc. For the goal he professed only to give the general principles; he had no ready-made scheme, no utopia. The positive organization of the new society in its details was a labor that would require fifty Montesqueus. The organization he desired was one on collective principles; a free association which would take account of the division of labor and which would maintain the personality both of the man and the citizen. With his strong and fervid feeling for human dignity and liberty, Proudhon could not have tolerated any theory of social change that did not give full scope for the free development of man. Connected with this was his famous paradox of anarchy, as the goal of the free development of society, by which he meant that through the ethical progress of men government should become unnecessary. "Govern-

ment of man by man in every form," he says, "is oppression. The highest perfection of society is found in the union of order and anarchy."

Proudhon is considered the father of the school of the philosophical anarchists (see ANARCHISM), who he held their views only in the germ and not in their developed form, and he has found, as he predicted, his chief following in the United States. Author: "Qu'est-ce que la Propriété?"; "De la Création de l'Ordre dans l'Humanité"; "Système des Contradictions Economiques"; "Confessions d'un Révolutionnaire"; "Actes de la Révolution"; "Gratuité du Crédit"; "La Révolution Sociale Démontrée par le Coup d'État"; "De la Justice dans la Révolution et dans l'Église." A complete edition, including posthumous writings, was published at Paris in 1875. Sainte-Beuve gave us in 1875 "P. J. Proudhon: La Vie et la Correspondance." In 1876 Mr. B. R. Tucker published a translation of the work on property. (See ANARCHISM.)

PUBLIC EMPLOYMENT BUREAUS: The movement for public employment bureaus, which under different forms are now being started in almost all progressive countries, has been occasioned mainly by the evils attendant so frequently upon private bureaus. These evils have developed, and upon the same general lines, in all countries, evils of charging somewhat heavy registration fees from those seeking work, holding out hopes and promises, and then sending them here and there with all sorts of baseless stories, without doing anything for them, except get their money; evils to employers of recommending employees or servants of whom they really know nothing; evils to girls of sending them to places of whose moral character they do not know, and not seldom of deliberately alluring them into houses of ill repute.

Public employment bureaus have grown out of these evils, by a natural evolution, through various grades. It is therefore necessary to exactly understand the different kinds of employment bureaus. These may be said to be six:

In the first place we put the labor bureau connected with some trade-union. These in all countries do a large and important work, but of course only for the members of the trade-union with which they are connected.

Again to these, but in most countries slightly developed, are labor bureaus established by working men, but not in connection with any one trade-union.

A third class consists of labor bureaus established by employers. In some countries these play a somewhat large part and are able to find work for many men.

A fourth and more important class is the regular commercial employment bureaus, altho in almost all countries these seem to be mainly for domestic servants, waiters, and the like.

A fifth class of employment bureau which in some places has developed a large activity is the bureau established by some form or other of charitable or philanthropic association.

The last kind of employment bureau is the bureau established by the municipality or state, which in Europe at least has been frequently very successful and seems on the increase and will demand careful study.

I. Europe

We commence with France, not because the French bureaus are the most important or the most successful, but because France first attempted public efforts in this line, and upon her experience to some extent has been based the action of other countries.

In France as early as 1848 the French provisional government of the day voted to establish a free information bureau in each of the mayoralties of Paris. These were by no means success-

ful owing to political considerations and their want of success long discounted the idea of municipal bureaus.

Employment bureaus carried on for gain have as a result been by far the most numerous and at least until recently the most successful of the agencies for securing situations in France. The number of situations obtained by them runs over a million every year. But these are very largely limited to obtaining situations in domestic service or for waiters in hotels and restaurants, and many complaints against them are made so that there is a movement for their suppression by law.

A small class of French bureaus has at present little influence—the old Gild Registries, over fifteen of which still remain from the old French gild system.

France

Much more important in France are the trade-union employment bureaus. In 1903 1,017 trade-unions maintained labor bureaus or registries out of a total of 3,934 trade-unions existing in France. These, however, tend to become connected with the labor exchange, or "Bourse du Travail," an institution somewhat peculiar to France, altho to an extent copied in Italy and other countries. The first labor exchange was that created by the municipality of Paris in 1887, of which an employment bureau was to have been from the start one of the important features. (See LABOR EXCHANGE.)

Somewhat similar labor exchanges were started in Nîmes the same year, in Marseilles and Saint Étienne in 1888, Toulon in 1889, Bordeaux and Toulouse in 1890. In 1903 the total number of labor exchanges in France was 94 to which there were affiliated 1,871 trade-unions with a membership of 288,036.

In that year sixty-six of these exchanges made returns reporting finding employment for 75,175 persons, not two thirds of which were permanent.

French municipal employment bureaus have been more successful. They were, however, slow in development, because of the want of success attending the 1848 experiments. The attempt, however, was revived in 1886, and by 1900 there were 52 municipal employment bureaus in France. In 1902 30 of these reported finding situations for 58,752 people, of which over 50 were permanent.

German Public Employment Bureaus are undoubtedly the best of any country in the world, but were not the first kind to be developed.

The ordinary commercial employment bureaus of Germany, as in other countries, occupy themselves mainly in placing domestic servants. They are much criticized, and some of

Germany

them, as in other countries, for immoralities connected with them. This is one of the reasons why Germany is turning to the Public Bureaus. For the bureaus in connection with the Relief Stations, see RELIEF STATIONS.

The trade-unions of Germany, as elsewhere, maintain in many instances employment bureaus. Several employment bureaus are maintained in Germany in connection with the Chambers of Agriculture.

The characteristic employment bureau of Germany is, however, as we have said, the Public Bureau, often commenced by some private voluntary association and occasionally so continued, but almost always at least subsidized by the municipality (sometimes by the commune), and, in most cases, coming to be a Municipal Bureau,

managed by the municipality (sometimes the commune).

The first employment bureau of this kind in Germany was founded in Stuttgart, in 1865, by a workman's improvement society. It was later joined by other societies, and in 1895 became the Stuttgart Municipal Employment Bureau. The example of Stuttgart was followed by Cologne in 1874; by Berlin, 1883; Hanover, 1889; Düsseldorf in 1890; Carlsruhe, 1891; Freiburg, 1892. They then became common; 5 such public or municipal bureaus were established in 1893; 8 in 1894; 23 in 1895; 12 in 1896 (all the largest cities already having them); 8 in 1898; 9 in 1899; 11 in 1900; 5 in 1901; 2 in 1902. By 1904 there were 136 bureaus. In 1898 an association of such bureaus was established for the empire. This association has an organ, the *Arbeitsmarkt*, a bimonthly edited by Dr. Flesch, and first published in 1887. Many conferences on the subject have been held. The Berlin bureau is a type of many. It found places in 1904 for 67,000 persons. It is conducted by various united societies, but receives a subsidy of \$5,000 from the municipality and is under its strict supervision. It is free to all employees. Workmen who register pay a fee of 20 pfennig (five cents). Several of the skilled labor-unions use the bureau instead of maintaining bureaus of their own. Employers and employees are equally represented in the management. Such is the type. But Berlin is not generally supposed to have the best public employment bureau. This honor is usually given to Stuttgart or Cologne.

Characteristic of all of them, however, is the fact that they are managed by committees on which employers and employees are equally represented. The Germans consider this fact so vital that they have coined a word to express it—*parität*, or the equal representation of employer and employed. Second, however, only in importance to this is the importance they give to the bureaus by having at the head of the committees the foremost citizens.

In Frankfurt the burgomaster or mayor nominates the president of the employment bureau committee. In Elberfeld a committee of the "Arbitration Court" also manages the bureau. In Munich the president of the "Arbitration Court" is also president of the bureau. In Nuremberg the bureau is under the superintendence of the city magistracy. In Breslau a member of the magistracy is the head of the bureau. Upon the Berlin committee are an official from the Imperial Ministry of the Interior, well-known professors and publicists, as well as employers and employees. In Cologne the municipality bears all the costs, but, while keeping a general control, leaves the actual management to a committee of various unions, including the trade-unions, the union of Independent Handicrafts, the guilds, and a number of religious and labor societies.

In Bavaria the decisive step has been taken of making the communes by law responsible for the labor bureau. In Bavaria, too, the system of distinctive municipal bureaus has been most developed into a complete system. There are seven central employment bureaus in the eight largest Bavarian cities, and these have forty-five outlying bureaus connected with them. This systematization of course enormously increases the value of each bureau in hearing of situations and therefore in supplying them to applicants. The constitution of these bureaus is usually similar. No fees are charged; the entire cost is defrayed by the

municipality (assisted by grants from the Bavarian Government).

That these municipal bureaus have succeeded is seen in the increase of the work done. In Munich the bureau filled 25,586 situations in 1896, 51,664 in 1903. In 1896 47,008 people applied for situations, and 79,505 in 1903. In 1896 30,057 positions were offered by employers, and in 1903 67,429. Indeed, the municipal bureau at Munich exceeds the work done by all other employment bureaus in the city taken together. Of every 100 applications for work it receives, 65 per cent are successful, a much higher percentage than any other form of employment bureau. The expenses of the municipal bureau in 1903 amounted to \$8,705, of which \$5,820 went in salaries. There was a grant from the Bavarian Government of \$1,025 and not including the grant the cost of each situation procured was fourteen cents per situation. Indeed, one of the marked characteristics of the German public bureaus is this cheapness of operation. In Carlsruhe, in 1903, it was 13 cents for each of 11,496 positions filled; in Mannheim, 11 cents for each of 10,939 positions filled; in Cologne, in 1904, it was 9 cents for each of the 28,200 positions filled.

At first the labor-unions were suspicious of these bureaus, but being public and managed equally by employers and employees, this suspicion has given way to confidence.

II. Other Countries

Other European countries have little new to offer. Belgium and Italy have developed some labor exchanges like the French bourses de travail, and with employment bureaus attached, yet with little success. They are therefore turning now to the German type. Austria and Denmark have followed the lead of Germany directly, notably at Vienna, Basel, Bern, Zurich, and Copenhagen. Switzerland is developing a federal system of employment bureaus. In England, out of the recent agitation of the question of unemployment has come the recent establishment of a system of public employment bureaus called labor bureaux, too recent, however, yet to show results either favorable or unfavorable.

(For the interesting work of the New Zealand Government in obtaining work for the unemployed through the cooperation of the police, see NEW ZEALAND.)

From a study of the German bureaus Dr. Varlez, of Ghent (Belgium), an authority on the subject, lays down the following principles for their management:¹

III. Principles

1. The employers and the employees should have an equal right in the management of the bureaus. They should also have equal rights in the administration of the bureaus.
2. The presidency should be in the hands of men not interested in industrial conflicts.
3. A purely bureaucratic management is irreconcilable with an effective management of the bureaus.
4. The management should not be placed exclusively in the hands of philanthropic institutions.
5. The expenses of the organization and administration of bureaus, in which employers and employees are equally interested, should fall upon the public authorities; principally upon the local community.
6. The placing of laborers outside of the community should be in charge of a central bureau rather than in that of the district bureau.
7. The procuring of work should be free of charge.

¹ Report on the Reorganization of the Ghent Labor Exchange, Ghent, 1906.

8. The placing of laborers should not be purely a local matter; it should extend to the surrounding district.

9. The bureau should try to keep in touch and, if possible, to cooperate with all agencies which undertake to find employment.

10. The public authorities should control all employment bureaus so as to prevent commercialism on their part and hostile action toward the public bureau.

11. The statistics of the bureaus should be kept with the greatest care.

12. The public bureaus should be for both sexes.

13. The public bureaus should endeavor to place both working men and domestics.

14. Women clerks should be used in placing women applicants.

15. Direct contact between employers and employees, and also between persons of different sexes, should be avoided in the office of the bureau.

16. Strikes and lockouts should be reported immediately to the employment bureau, and should be announced there, but it should not be necessary to close the office to the trades implicated.

17. All the transactions of placing people should be carried on within the office of the bureau.

18. Managers of offices should try to satisfy their clients, both employers and working men, without following the strict order of application, which is more or less a matter of chance.

19. Officers should energetically combat the practise of working men in applying directly to employers who are patrons of the bureau, for positions.

20. To make known their work the public employment bureaus should use all the different methods of advertising which are used by commercial institutions.

21. The labor bureau should be interested in placing of apprentices and in the form of their contract, because the future of the labor market depends upon the proper management of apprenticeship.

22. Employment bureaus of neighboring villages should as far as possible cooperate with each other.

23. Bureaus in villages should try to interest themselves in the question of the depopulation of the country districts and the poverty of farm-laborers.

IV. The United States

We abridge here the account of free public employment offices in the U. S., by J. E. Conner, Ph.D., in the *U. S. Bulletin of Labor* (Jan., 1907):

1890. Ohio, 5 offices, Cleveland, Columbus, Cincinnati, Dayton, and Toledo; salaries paid by cities at first, now by state.

1893. Los Angeles, Cal., a municipal office, founded and maintained by labor-unions, later assumed by municipality and county, now by municipality.

1894. Seattle, Wash., a municipal office, founded by an amendment to the city charter.

1895. Montana, first legislative attempt at a mail-order system. Changed by a substitute act of March 6, 1897, to a law permitting municipalities to act for themselves. Butte office, 1903; Great Falls, 1905; both founded by city ordinances and virtually municipal offices.

1896. New York, 1 office, New York City; act repealed and office discontinued, 1906.

1897. Nebraska, mail-order system, only 1 office, state capital at Lincoln.

1899. Illinois, 4 offices, 3 in Chicago and 1 in Peoria; original act declared unconstitutional, present one passed May 11, 1903.

1899. Missouri, 3 offices, St. Louis, Kansas City, and St. Joseph.

1901. Connecticut, 5 offices, Bridgeport, Hartford, New Haven, Norwich, and Waterbury.

1901. Kansas, mail-order system; only 1 office, state capital at Topeka.

1901. West Virginia, 1 office, Wheeling.

1901. Wisconsin, 4 offices, La Crosse, Milwaukee, Oshkosh, Superior.

1901. Duluth, Minn., municipal office; founded by city ordinance.

1902. Maryland, 1 office, Baltimore.

1902. Sacramento, Cal., municipal office; founded by city ordinance.

1904. Tacoma, Wash., municipal office; founded by city ordinance.

1905. Minnesota, 1 office, Minneapolis; municipal office at Duluth continues as organized.

1905. Michigan, 2 offices, Detroit and Grand Rapids.

1905. Spokane, Wash., municipal office; founded by city ordinance.

The conclusion to which Dr. Conners comes concerning these bureaus is as follows:

The free public employment office must be regarded thus far as an experiment with some failures, many mistakes,

and several successes to be recorded as its briefest summary. The failures have not been upon fundamental points and the mistakes are believed to be preventable. The history of this movement has been one of progression and not retrogression, tho the progress must be looked for as a whole rather than within any one of the several states. The individual states have shown but little inclination to modify their earlier enactments or to profit by the experience of others.

The offices have not uniformly followed the practise of giving their services without the payment of a fee. The experience where a fee has been charged indicates that perhaps the best results would be obtained from a small fee which each applicant for employment should pay for each position he secures, following the principle of making the service pay its own expenses. This fee could be collected subsequent to employment.

The offices should be located whenever practicable in the city hall or the court-house. This is desirable for two reasons. First, that the burden of the support of the office may be distributed between the state and the locality, the latter accounting at least for the item of rent, the former assuming responsibility for all remaining expenses; second, in order that the office may be as closely as possible associated with other social services, and be placed incidentally on an equal footing with other public offices.

That those seeking employment should be protected from the schemes of the unscrupulous has been urged more than any other motive as a reason for the establishment of free public employment offices. The experience of the various states does not justify the belief that free competition by the state can be relied upon alone to drive out the unscrupulous private agencies or correct their abuses. To accomplish this object the first requisite is a law covering the specific abuses. Following the system developed in Illinois, the free public employment office may be used as a valuable adjunct in the administration of such a law.

A second motive advanced is the need of a public agency to furnish all possible assistance to the unemployed seeking employment. Private initiative cannot be relied upon to do this for the reason that it must make merchandise of men's necessities to an extent that is socially harmful, even when conducted as a legitimate business and entirely free from extortionate practises.

The economic motive is a third reason advanced in justification of the free public employment office. This may be analyzed into the saving of money to those for whom it is useful that money should be saved, and the bringing together the laborer in search of work and the employer seeking help, thus with the least possible expense reducing unemployment to a minimum and supplying the demand for workers to the fullest extent.

The private employment offices in large cities have become highly differentiated and, while the cost is sometimes excessive and exorbitant, in many cases they render a higher grade of service than the public office.

Conclusions As a rule it is safer to trust the public offices for the lower grades of employment, but in the higher grades it is possible in many cases to get better service through the private offices.

Specialization of the free employment office is theoretically possible, but by reason of the expense to the state it is impracticable save in an elementary degree, namely, the separation of the skilled from the unskilled labor market by the establishment of two corresponding grades of offices. Whether the state offices, if on a self-supporting basis, could equal the private agencies in efficiency is altogether problematic.

There is often a large unsatisfied demand for unskilled labor. On the other hand there is at times a large supply of this grade of labor outside of the larger industrial centers, in the towns and small cities where there is no great industrial activity. Bringing these two factors of the labor market together would be a great economic gain and much more desirable than the encouragement of immigration to satisfy the labor demand.

The "mail-order" system of free employment offices has furnished most of the instances of failure. This system is simply a labor registry for employer and employee and necessitates a correspondence bureau at the state capital, where the real work of fitting the man to the job is essayed by correspondence. In the light of American experience this system is successful only in the supplying of harvest hands in the wheat belt.

It is evident from the above how far the American free public employment bureaus fall below the German. No such bureaus can expect to make a large success. Until public bureaus be given the importance and standing and size of the German, failure must follow. Nor until they are managed as in Germany by employers and employees equally will they have the confidence of the labor-unions necessary to their success. Con-

cerning the New York public employment bureau which was discontinued, Dr. Connors says:

The New York statute of 1896, creating the one free employment office in New York City, while not primarily designed upon the mail-order plan, was scarcely less parsimonious in relation to the field it occupied. In the light of experience in New York City and elsewhere, the attempt to counteract the abuses of the private agencies by the competition of one state office set down in the midst of the city without sufficient advertising, assistance, or anything else, could hardly be expected to succeed.

PUBLIC LANDS: The public domain of the United States—lying principally in the western half of the country—now amounts, in round numbers, to a little less than half a billion acres. Uncle Sam is yet by far our largest landowner.

The first landed operations in America consisted, in the early colonial days, in the granting, by the British, French, and Spanish crowns, of immense tracts of land in the provinces to titled and influential individuals. With the formation of the republic, the principle prevailed of the government selling its public land to the highest bidder. Later, the preemption law was enacted by which the nominal price was fixed at \$1.25 an acre, and under this fairly beneficent act of Congress great home-making areas were carved out of the middle-western states, the intent of the law being that settlement and residence should accompany and follow purchase. Subsequent to this, various other land-acquiring laws were enacted, the principal one being the homestead law, which enabled a man to take up 160 acres of public land and, by residing upon and improving it for five years, to acquire title without other cost than a small fee.

The general sentiment of the nation has always favored a liberal land policy, but the underlying motive has been to induce and require settlement to the end that the country might become rapidly peopled. From the very beginning, however, practices and modifications crept in under which land could be obtained without actual settlement, but for speculative purposes, usually, however, under the guise of promoting instead of defeating settlement. Thus, shortly after the passage of the homestead law, what is known as the "commutation clause" was enacted. This provides

Homestead Law

that after a residence upon a homestead claim of fourteen months the entryman may, by the payment of \$1.25 an acre, secure immediate title to his land. Under this law hundreds of thousands of acres of the best of the government lands of the West have been entered with but a mere semblance of improvement and settlement, commuted to cash, and transferred to speculators and syndicates, the entryman receiving a small bonus for the exercise of his right.

Then also was enacted the desert land law, supposed to be in the interest of the settlement of desert lands. Under it a man could enter 640 acres of "desert land," and upon irrigating a portion of it and paying \$1.25 an acre, secure title thereto. This law has likewise been flagrantly abused and vast areas of rich lands, many of them absolutely non-desert, have been entered, patent secured from the government and immediately transferred by the entryman to some live-stock syndicate or speculative corporation. In several of the grazing states tracts can be seen to-day of 10,000 or 20,000 acres, or even greater areas of

contiguous land, acquired from the government under the desert land law, but which have never been settled upon, and never been irrigated. This law also is still in force, except that its unit has been reduced from 640 to 320 acres. The great defect in the law is that it does not require actual settlement.

In the "seventies" the timber and stone law was passed by Congress. It was supposed to be for the benefit of the individual homesteader or settler, in that it allowed him to buy from the government for his own use 160 acres of timber land at \$2.50 an acre. This law has probably been even more flagrantly abused than any of the public-land-acquiring laws. Under it, entire train-loads of people—Eastern school-teachers—have been transported by lumber syndicates into the finest timber regions of the West, and furnished the money to buy, each his 160 acres, and then immediately transfer it to the syndicate. Vast tracts of land worth, according to government agents, \$100 an acre, have thus been sold by the government for \$2.50 an acre.

Recent investigations of the General Land Office have shown that almost equally great frauds have crept into the disposal of government coal lands, through the manipulation of dummy entrymen and the acquirement of the land under other than their rightful classification.

Various other laws have been enacted from time to time, in the main detrimental to the nation, and through which the great public domain has gradually, in large measure, passed into the hands of speculators and syndicates—at least not into the hands of bona-fide settlers. At the present time there are four principal land-acquiring laws which are conceded to be a detriment to

Present Laws

the actual development of the country—the commutation clause of the homestead law, the desert land law, the timber and stone law, and the coal land law. During the past five or six years a considerable agitation has arisen looking to land law reform or repeal by Congress, and in 1903 President Roosevelt appointed a special public lands commission, consisting of the Commissioner of the General Land Office, the chief engineer of the Reclamation Service, and the chief of the Forest Service, to personally investigate the land question and present proper recommendations. The two succeeding annual reports of the commission brought to light a condition of unparalleled fraud and non-compliance with existing laws. At the same time the Secretary of the Interior was unearthing gigantic land frauds, involving men in high official positions. The report of the commission was called to the attention of Congress by the president in several unusually forceful messages. The repeal of the timber and stone law was recommended by him, and such amendment of the desert land law, the commutation clause of the homestead law, and the coal land law as to entirely nullify their bad features. Congress unfortunately turned a deaf ear, and in Dec., 1906, the president sent to that body a still more urgent recommendation along the same lines, and in a later message urged the retention of the vast body of coal lands of the West which he asserted were being fraudulently entered and transferred to coal monopolies. It is a most regrettable circumstance that Congress has paid no heed whatever to these suggestions of the executive.

No better statement of the present public land

situation can be made than to quote from these messages of the president, briefly as follows:

¹ The timber and stone act has demonstrated conclusively that its effect is to turn over the public timber lands to great corporations. It has done enormous harm, it is no longer needed, and it should be repealed. The desert land act results so frequently in fraud and so comparatively seldom in making homes on the land that it demands radical amendment. That provision which permits assignment before patent should be repealed, and the entryman should be required to live for not less than two years at home on the land before patent issues. Otherwise the desert land law will continue to assist speculators and other large holders to get control of land and water on the public domain by indefensible means.

The commutation clause of the homestead act serves, in a majority of cases, to defeat the purpose of the homestead act itself, which is to facilitate settlement and create homes. In theory the commutation clause should assist the honest settler, and doubtless in some cases it does so. Far more often it supplies the means by which speculators and loan and mortgage companies secure possession of the land. Actual—not constructive—living at home on the land for three years should be required before commutation, unless it should appear wiser to repeal the commutation clause altogether. . . . The present coal law, limiting the individual entry to 160 acres, puts a premium on fraud by making it impossible to develop certain types of coal-fields and yet comply with the law. It is a scandal to maintain laws which sound well, but which make fraud the key without which great natural resources must remain closed. . . . Mineral fuels, like the forests and navigable streams, should be treated as public utilities. This is generally recognized abroad. In some foreign countries practical control of a large portion of the fuel resources was allowed years ago to pass into private hands, but the existing governments are endeavoring to regain this control in order that the diminishing fuel supply may be safeguarded for the common good, instead of being disposed of for the benefit of the few—tho the mistake of the preceding generation in disposing of these fuels for a nominal return cannot always be corrected by the present generation, as the cost may be so enormous as to be prohibitory. . . . Already probably one half of the total area of the high-grade coals in the West has passed under private control. Including both the lignite and the coal areas, these private holdings probably aggregate not less than 30,000,000 acres of coal-fields. With the remainder of the lands containing mineral fuels reserved and leased by the government, there will be ample opportunity to determine, in the near future, which of the two systems—private ownership or the leasing system with general government supervision—will best protect the interests of the people and thus promote the permanent development of the West. . . . I wish to express my utter and complete dissent from the statements that have been made as to there being but a minimum of fraud in the actual working of our present land laws. I am exceedingly anxious to protect the interests of bona-fide settlers and to prevent hardship being inflicted upon them. But surely we are working in their interests when we try to prevent the land which should be reserved for them and for those like them from being taken possession of for speculative purposes or obtained in any fraudulent fashion.

GUY ELLIOTT MITCHELL.

PUBLIC OWNERSHIP (for the facts of public ownership, see articles **LIGHTING**; **RAILROADS**; **STREET-RAILROADS**; **TELEGRAPH**; **TELEPHONE**, and **WATER-WORKS**. For public ownership in Great Britain, see **MUNICIPAL OWNERSHIP** and **MUNICIPAL TRADING**. For public ownership on the Continent, see the separate subjects, also **MUNICIPALITIES**, German):

We present in this article the arguments for and against public ownership, largely made up of quotations from representative authorities on both sides, and close the article with the final report of the Public Ownership Commission of the National Civic Federation, which investigated both private and public plants and systems in the United States and Great Britain and has presented the most recent and undoubtedly up to date the most authoritative statement of final conclusions.

¹ For complete report of the Public Lands Commission and the president's message, see Senate document No. 154, 58th Congress, 3d session; also president's messages to Congress on public land matters of Dec. 17, 1906, and Feb. 13, 1907.

I. Advantages of Public Ownership

In this section we largely quote from Prof. Frank Parsons's "The City for the People," as generally considered the best general authority in favor of public ownership. Professor Parsons finds the following arguments for public ownership:

1. It lowers rates to the community. The main reasons for this are as follows:

1. A public plant does not have to pay dividends on watered stock.

2. It does not have to pay dividends even on the actual investment.

3. It does not have to retain lawyers or lobbyists, or provide for the entertainment of councilmen, or subscribe to campaign funds, or bear the expenses of pushing the nomination and election of men to protect its interests or give it new privileges, or pay blackmail to ward off the raids of cunning legislators and officials, or buy up its rivals, etc.

4. It does not have to advertise or solicit business.

5. It is able to save a great deal by combination with other departments of public service. Speaking of the low cost of electric light in Dunkirk, the mayor of the city says: "Our city owns its water plant, and the great saving comes from the city's owning and operating both plants. No extra labor is required but a lineman. The same engineers, firemen, and superintendents operate both plants, and the same boiler-power is used." So in Bangor, Marshalltown, and a number of other places, the municipal lighting system is run in connection with the public water plant. In Wheeling the gas and electric plants are operated together. In La Salle the fire, water, and light departments are consolidated. A great saving in the cost of labor and superintendence results.

6. Public ownership has no interest to pay.

7. Even where public ownership is incomplete, the people not owning the plant free of debt, they still have an advantage in respect to interest, because they can borrow at lower rates than the private companies have to pay.

8. As cities usually act as their own insurers, public ownership is free of tribute to the profits and agency commissions of private insurance companies.

9. There is often a large saving in salaries. A public plant pays its chief well, but does not pay the extravagant salaries awarded by millionaire monopolists to themselves or their substitutes in office.

10. Public plants frequently gain through the higher efficiency of better treated and more contented labor, still further energized in many cases by the noble motives and sentiments that go with public service in the minds of patriotic men.

11. The losses occasioned by costly strikes and lockouts do not burden the ledgers of public works.

12. Damages and costs of litigation are likely to be less with public than with private works. Accidents are fewer in a system that aims at good service and safety, and treats its employees well. When they do occur, the claims are often compromised or settled fairly and amicably without suit.

13. The civic interest of the people leads to other economies through the increase of patronage and the lessening of waste. The larger the output, the lower the cost of production per unit of service, other things equal, and the tendency to waste electricity, water, etc., is much less when the people know that the service is a public one, the profits of which belong to them and the loss in which, if any, must be paid by them, than when they know that the service is rendered by a private corporation charging monopoly rates and making big profits for a few stockholders. These economies are intensified as education and experience with public ownership develop the understanding and the civic patriotism of the people.

14. The diffusion of wealth and elevation of labor accompanying public ownership tend to diminish the extent and the cost of the criminal and defective classes.

15. The cost of numerous regulative commissions and interminable legislative investigations into the secrets of private monopolies would be saved by the extension of public ownership.

16. The elimination of conflict and antagonism carries with it the cost of all the useless activities prompted by that antagonism. Legislation would cost us less, for example, were it not for the private monopolies. For a large part of the time and attention of our legislatures is given to them.

Illustrations of the lowering of rates are as follows:

Street Cars.—When Glasgow took over the tramways, fares were reduced one third at once, and reductions have been continued till now the average fare is less than half the average fare collected by the private company.

Telegraph and Telephone.—When England bought out the private telegraph companies, in 1870, and made the telegraph part of the postal service, she reduced the rates one third to one half.

experienced by the cities, amounting to practical impossibility of securing a reasonable regard to the public interest, or even the fulfilment of actual contracts. He gives the following table in the report of the Public Ownership Commission:

EXTENSION OF LINE BEFORE AND AFTER MUNICIPALIZATION

| CITY ¹ | No. of years | Period before municipalization. Miles of line increased— | | Date of municipalization | Period since municipalization. Miles of line increased— | | No. of years | Per cent of increase for period— | | Annual average per cent increase | |
|---|--------------|---|------|--------------------------|--|------|--------------|----------------------------------|-------|----------------------------------|--------------|
| | | From | To | | From | To | | Before | After | Company period | City period |
| Glasgow | 12 | 22.2 | 30 | '94 | 30 | 80.5 | 12 | 35 | 168 | 2.7 | 14 |
| Leeds | 12 | 13.7 | 14.2 | '94 | 18 | 54.2 | 12 | 3.7 | 201 | .3 | 16.3 |
| Liverpool | 9 | 41 | 43.7 | '97 | 43.7 | 63.4 | 9 | 6.7 | 45 | .7 | 5 |
| Sheffield | 10 | 9.4 | 9.4 | '96 | 9.4 | 35.5 | 10 | ... | 275 | ... | 27.5 |
| Manchester | 4 | 80.5 | 87.5 | '01 | 55.7 | 87 | 4 | 8.7 | 56 | 2.2 | 14 |
| Municipalities— Group averages | | | | | | | | | | 1.2 | 15.8 |
| | | | | Dividing date | | | | | | Earlier period | Later period |
| Dublin | 12 | 31.3 | 33.3 | '94 | 33.3 | 49.5 | 12 | 6 | 48 | .5 | 4 |
| Edinburgh | 12 | 13.3 | 18.4 | '94 | 11.7 | 22.7 | 12 | 38 | 94 | 3.1 | 7.8 |
| Belfast | 10 | 15.1 | 23 | '96 | 23 | 39.1 | 19 | 52 | 79 | 5.2 | 7 |
| Bristol | 9 | 11.2 | 19.6 | '97 | 19.6 | 28.2 | 9 | 75 | 44 | 8.3 | 4.8 |
| Norwich | ... | ... | ... | '01 | 18.8 | 14.5 | 5 | ... | 6 | ... | 1.2 |
| Companies— Group averages | | | | | | | | | | 4.0 | 5.5 |

¹ The first five cities, Glasgow, Leeds, Liverpool, Sheffield, and Manchester, changed from private to public operation at dates ranging from 1894 to 1901, and the rate of extension in the period of company management is compared with the rate under public management. The last five cities, Dublin, Edinburgh, Belfast, Bristol, and Norwich, have had company operation during both the earlier and later periods, except that the last two or three years in Belfast the city has been taking over the lines, completing the process Dec. 31, 1904. The London United Tramways Company was not organized till 1901, and made no returns for 1902. Moreover, the data available do not enable us to distinguish between extensions and the increase of mileage by consolidations of companies, so the company has not been included in this table.

In the U. S. the story is the same.

ELECTRIC LIGHTING

| CITIES | MUNICIPALIZATION | |
|----------------------|------------------|-------|
| | Before | After |
| Aurora, Ill. | \$325 | \$72 |
| Elgin, Ill. | 228 | 62 |
| Fairfield, Iowa .. | 375 | 95 |
| Marshalltown, Iowa | 125 | 40 |
| Bay City, Mich. | 100 | 67 |
| Detroit, Mich. | 132 | 83 |
| Allegheny, Pa. | 180 | 86 |
| Bangor, Me. | 150 | 58 |
| Lewiston, Me. | 182 | 58 |
| Peabody, Mass. | 185 | 73 |

II. Public ownership gives a fuller service. Private companies supply only those services which pay, public ownership supplies services which are needed. This is eminently so as between the Western Union Telegraph and the U. S. Post-office. It has been so in Great Britain. Indeed dissatisfaction with the growth of the private systems has been one of the main causes of the extension of municipal ownership in Great Britain.

As to street-cars, the principal reasons, according to Professor Parsons, were poor service by the companies; their ill treatment of employees; their refusal to assent to the adoption of electric traction, extension to suburban districts, and other vital improvements; the constant difficulty

III. Public ownership treats the public impartially. Secret rebates and discriminations have been one of the main evils of the privately owned railways of the U. S. (For a discussion of this, see RAILWAYS.)

IV. Public ownership favors safety to life (see RAILWAYS), showing that it is six times as safe to travel on the State-owned railroads of Germany as on the privately owned railroads of the U. S.

V. Public ownership tends to diminish fraud and the corruption of government. (See Mr. Steffens's testimony, article CORRUPTION.) Professor Parsons's "City for the People," pp. 154-155, gives the following testimony:

Professor Commons says: "I maintain that nine tenths of the existing municipal corruption and inefficiency result from the policy of leaving municipal functions to private parties; and that an essential part of the present unparalleled awakening of civic conscience on the part of all classes of the people is the desire for municipal ownership of franchises. As the people become aroused to the degradation of their politics and to the need of reform, their attention is concentrated on the chief source of that degradation, the underhanded and often high-handed domination of city officials and machine politics by the corporations whose life is maintained by city franchises."

Professor Ely says: "Our terrible corruption in cities dates from the rise of private corporations in control of natural monopolies, and when we abolish them we do away with the chief cause of corruption. 'But,' it is said, 'we must take natural monopolies out of politics.' It never has been done, and it is an impossible thing to do—absolutely impossible. No gas-works, no water-works, no street-car lines, no steam-railways, are so thoroughly in politics as those in the United States. Our American railroads are incomparably more 'in politics' than the German railroads. Not only this; those

German railroads which have been bought by the State, I believe, are less 'in politics' than they were when they were private property. . . . I unhesitatingly advocate public ownership and management for gas-works, and I challenge any one to instance a single American city—or, for that matter, any city, wherever situated—which has gone over to public ownership and which regrets it; which, indeed, has not found that a corrupt political influence was thereby removed and political life purified."

Dr. Albert Shaw says: "The pressure that would be brought to bear on the government to produce corruption under municipal ownership of monopolies like gas, electric light, transit, etc., would be incomparably less than the pressure which is now brought to bear by the corporations."

Governor Pinckney says: "The corporations are responsible for nearly all the thieving and boodling with which our cities suffer. . . . Good municipal government is an impossibility while valuable franchises are to be had and can be obtained by corrupt use of money in bribing public servants."

Say the defenders of public ownership in the report of the Civic Federation Commission:

We were told by leading men in England that the abolition of the old régime of corruption in British cities was largely due to the development of municipal ownership; that the companies behave well now, because they know their works will be municipalized if they do not and because the growth of municipal ownership has evolved a public sentiment and a type of character that will not tolerate civic abuses; that public spirit and civic patriotism have grown as the increase of public business enlarged and intensified the demand for them; and that the way for America to secure the civic honor and devotion that underlie the clean management of both public and private plants in Great Britain is to develop public ownership of public utilities.

For example, the Right Hon. John Burns, the famous progressive leader in the London City Council and in Parliament, and now president of the Local Government Board, and one of the highest authorities in the world on questions of municipal policy, said to the commission:

"Some of you may be asking yourselves the question whether you can do in America what has been done in England. I have been in America several times and am somewhat familiar with your political and municipal conditions, and if some of you are thinking, 'Can America do what England has done?' let me say that if you want to develop a public spirit (of which I think you possess more than your detractors would have us believe), you cannot do better than to develop a new school of civic statesmanship through municipal undertakings. In the laboratory of public ownership, from the social crucible there will emerge a new statesmanship that may solve your problems of government in the best way."

"If you are ever going to have such a public spirit as we have in England, you must make a beginning, and you cannot make a better beginning than by undertaking those forms of municipal trading which are so successful here. In their administration will be developed a new sphere of public activity for your young men. In that work scope will be found for their activities in adding to public comfort, profit, and elevation."

VI. *Better treatment of labor* is one of the chief recommendations of public ownership. The tendency shows itself in shorter hours and longer wages, better provision for safety and comfort, larger liberty, and care for accident and old age. Public ownership puts labor above capital. Private ownership puts capital above labor.

Says Professor Parsons, "City for the People," p. 160:

"The Brooklyn Bridge record of \$2.75 for trainmen for an eight-hour day on the public cars (while it was under public management), while the private companies, running over the same bridge, pay \$1.50 to \$2.30, or an average of less than \$2 for ten hours, shows the tendency of public ownership in this regard."

"Years of careful study of the attitude of public and private corporations toward laboring people led me, in a series of articles on street-railways in 1897, to make the following comparative statement of

Insecurity of employment—arbitrary discharge at the whim of a petty boss.

Strikes, boycotts, blacklists.

Carelessness of the conditions of labor, men bought as commodities at the lowest market price and thrown away like old clothes when the value is worn out of them; no protection from cold and storm; no provision for the worker in case of sickness and old age, nor for his family in case of his death; no sympathetic treatment of the workers as partners and brothers or even as valuable live stock, but merely as money-making tools that can be replaced at little if any cost.

High fares curtailing the use of the roads by the working people, and compelling them to live in crowded tenements near their work.

Large profits to a few, adding to the disturbance of wealth diffusion which constitutes the main grievance of labor today.

Masterhood and moneyed aristocracy.

Public Ownership Means

Short hours and high wages for workers.

Reasonable hours and moderate salaries for managers.

Full recognition of the rights of organization and petition.

Moderate regulations for the public good.

Greater security of employment and a growing movement toward making it absolutely secure.

Petition, investigation, redress, with the ballot as the final resort.

A definite and persistent policy of improving the conditions of labor, appointing and promoting for merit and service, protecting employees from storm and injury, providing for sickness, old age, and death; recognizing that a contented, well-fed citizenship is of the first importance; that men are worth more than money; that 4,000 happy homes in moderate circumstances are better than twenty luxurious palaces and 3,980 tenements pinched by poverty.

Low fares, enabling the working people to live at a distance and relieving the pressure in the tenement districts.

Profits for the people—no overgrown fortunes for the few; tendency to wealth diffusion and removal of the greatest danger of present industrial conditions.

Partnership, democracy, fraternity."

The Public Ownership Commission report (see above) gives the following statement of Professor Parsons:

Next to the wish to obtain a better service at lower fares, the predominant motive in the municipalization of British tramways has been the desire to improve the condition of labor. The companies worked the men eleven to fourteen hours a day for seven days, while the cities have made the hours of labor from nine to ten per day, with one day's rest in seven. Increases in wages were made also, amounting to 50 per cent in Liverpool, from 43 to 63 per cent in Manchester, and to 42 per cent in London. Notwithstanding these benefits to labor the reductions in fares were considerable, and the total savings from reduced rates for the twelve years under municipal management at Glasgow are estimated at \$23,000,000, as compared with the old company basis. The benefits to labor under city management at Glasgow are computed at \$515,000.

Says Professor Commons in the report:

In none of the American enterprises investigated were the common laborers organized. In the municipal undertakings they are paid higher wages and given shorter hours than in the case of private employees of the same locality. They are also in all cases citizens of the U. S., and residents of the locality. The common laborer of the private companies, except in Indianapolis and the Southern cities, where they are colored, is composed largely of immigrants and no attention is paid as to whether they have secured citizenship papers or not.

The policy of all the British municipalities is to place the minimum wages of common labor at the level paid by the best private employers for similar work. This is about 15 per cent to 40 per cent higher than other private wages for the same class of labor in the same locality.

In the U. S. the minimum paid for common labor by the private companies is, in all cases, except Atlanta, lower than that of the municipality, and the minimum paid for common labor by municipal undertakings is higher than that of private companies of the same locality.

ARGUMENTS AGAINST PUBLIC OWNERSHIP ANSWERED

It is said that public ownership fails to develop the great public services which require large investment of capital which can only be attracted by the possibility of large returns and long franchises. It is shown how in every public utility the U. S., where capital has had this inducement,

LABOR'S INTEREST IN PUBLIC OWNERSHIP

Private Ownership Means

Long hours and low wages for workers.

Short hours and big salaries for managers.

Denial of the rights of organization and petition.

Oppressive regulations for private interest and caprice.

has developed very much larger and fuller public service than has Europe under public ownership.

The answer to this is that it is not public ownership which lacks progress, but Europe. Say the defenders of public ownership in the Public Ownership report, speaking of the U. S. in comparison with Europe:

Our buildings, telephones, factories, farms, commercial enterprises, etc., also show a decided superiority, altho these things are subject to private ownership in both countries. The per capita use of typewriters, sewing-machines, automobiles, elevators, and telephones is greater in the U. S. than in Great Britain, as well as the per capita use of electricity and mileage of tramways. The habits of the people and their economic conditions are widely different in the two countries. The best method of arriving at a conclusion in regard to the effect of the form of management upon the service is to compare public and private plants in the same city or in the same country under similar conditions otherwise than as to ownership.

Making this comparison we find in the U. S. (see POSTAL SERVICE) the Western Union Telegraph Company much less progressive than the Post-of-

There is little about municipal trading to attract men of the first class. Mr. Edgar and Mr. Clark unite in saying: "We have not found evidence in the U. S. that the personnel of the city government of Chicago (referring to Mayor Dunne's administration) or Wheeling is superior to that of Atlanta or Norfolk, or that the introduction of municipal water and electric plants in Detroit has brought a higher type of citizenship into the governing body than we find in New Haven, which has neither."

Illustrations of the truth of this argument are abundant. Illustrating how far the development of public utilities in the U. S. under private ownership have outstripped those in Great Britain under public ownership, the defenders of private ownership in the Public Ownership report (see above), Mr. Charles L. Edgar (president of the Edison Electric Illuminating Company of Boston, Mass.) and Walton Clark (vice-president of the United Gas Improvement Company of Philadelphia, Pa.), give the following table:

ELECTRIC LIGHTING DEVELOPMENT IN THE UNITED KINGDOM AND THE UNITED STATES

| | United Kingdom, 1905 | United States, 1903 |
|---|----------------------|---------------------|
| Total cities of 8,000 population and over..... | 586 | 545 |
| Total population of such cities..... | 26,780,531 | 25,947,404 |
| Total public arc lights in such cities..... | 24,368 | 166,313 |
| Average population per arc light..... | 1,099 | 150 |
| Number of cities having no public arc lighting..... | 351 | 7 |
| Number of cities having central lighting stations..... | 333 | 545 |
| Cities having a population of 300,000 or over..... | 11 | 14 |
| Total population of such cities..... | 9,577,373 | 11,449,463 |
| Total public arc lights in such cities..... | 9,128 | 54,859 |
| Average population per arc light..... | 1,049 | 208 |
| Number of such cities having no public arc lighting..... | 1 | None |
| Number of such cities having central lighting stations..... | 11 | 14 |
| Cities having a population of 100,000 to 300,000..... | 34 | 25 |
| Population of such cities..... | 5,320,184 | 3,920,346 |
| Total public arc lights in such cities..... | 4,653 | 27,552 |
| Average population per arc light..... | 1,143 | 142 |
| Number of such cities having no public arc lighting..... | 5 | None |
| Number of such cities having central lighting stations..... | 32 | 25 |
| Cities having population of 50,000 to 100,000..... | 57 | 43 |
| Total population of such cities..... | 3,998,226 | 2,058,710 |
| Public arc lights in such cities..... | 4,118 | 13,651 |
| Average population per arc light..... | 971 | 150 |
| Number of such cities having no public arc lighting..... | 11 | None |
| Number of such cities having central lighting stations..... | 55 | 43 |
| Cities having population of 25,000 to 50,000..... | 112 | 94 |
| Total population of such cities..... | 3,838,814 | 3,252,371 |
| Public arc lights in such cities..... | 3,663 | 26,653 |
| Average population per arc light..... | 1,048 | 122 |
| Number of such cities having no public arc lighting..... | 38 | None |
| Number of such cities having central lighting stations..... | 94 | 94 |
| Cities having population of 8,000 to 25,000..... | 372 | 369 |
| Total population of such cities..... | 4,045,934 | 5,266,514 |
| Public arc lights in such cities..... | 2,806 | 43,598 |
| Average population per arc light..... | 1,798 | 121 |
| Number of such cities having no public arc lighting..... | 296 | 7 |
| Number of such cities having central lighting stations..... | 141 | 362 |

fice Department, and in Europe all publicly owned services (see above) to have been almost universally more progressive than private ownership.

Similarly so with the argument that labor is better paid and better off under private ownership in the U. S. than under public ownership in Europe. This is true, but it is still more true that labor is better paid and better off under public ownership in the U. S. than under private ownership in Europe. The only fair comparison is between the two systems in the same country.

II. Advantages of Private Ownership

I. A strong argument for private ownership is its economic as well as its productive efficiency compared with public ownership.

Three American gas-plants were examined by the Public Ownership investigating committee experts. These were at Wheeling, where the plant is operated by the city, and Atlanta and Norfolk, where there is private ownership and operation. In addition the committee visited the Philadelphia gas-works and the labor investigators visited the Richmond, Va., gas-works. As to the price charged the consumers, it was found to be seventy-five cents per thousand feet net at Wheeling, \$1 net at Atlanta, and \$1 net at Norfolk, the municipal plant thus selling at the lowest price. To offset this, however, Messrs. Edgar and Clark point out that in Atlanta there is free installation of service, at Norfolk partially free installation, while at Wheeling charge is made for the service pipe from

the curb to the meter and for the setting of the meter.

In comparing the public and private gas service, the writers against public ownership in the commission say:

If we consider together the price the Wheeling consumer pays for gas and the character of the service rendered, we may not doubt that he gets less of net result per dollar expended than does the gas consumer in Atlanta or Norfolk. Low and varying pressure, uncertain candle-power, influenced at times by a dash of natural gas (at Wheeling), will bring troubles to studying children that, while not factors in financial calculations, have a proper place in this inquiry. Wheeling's gas-plant is not an important factor in the well-being of Wheeling's citizens. What with fast meters, charges for service and meter-setting, absence of any gratuitous work, the admixture of 15-cent, eight candle-power natural gas, insufficient and irregular pressure, and general inefficiency in the complaint department, Wheeling gas is a dear commodity at any price. Our experts found nothing to praise in Wheeling's service and little to criticize in the service of the companies at Norfolk and Atlanta.

In general, it may be said, so far as condition of plant and operating efficiency are concerned, there could not well be a worse condition of affairs than the engineers report as existing at Wheeling. In the other two cities the record regarding condition of plant, and regarding the various points of practice mentioned above in the case of Wheeling, while it contains a few points of criticism, is on the whole satisfactory. In both cases the plant is pronounced to be modern and kept in an orderly condition.

II. One of the strongest arguments against public ownership, especially as applied to the U. S., is the corruption and inefficiency of our city governments, which are notoriously below the level of those in Europe, so that if public ownership has not been a success there, it would be a far worse failure here. The Philadelphia gas-works are an example.

Referring to the Philadelphia gas-works as an instructive comparison of the results of municipal and private operation, Dr. L. S. Rowe is authority for the statement that the quality of the gas supplied has been improved by the company now operating the service, and that through the rental paid the city has received for eight years an average profit of \$491,674 annually, while for the last few years under city operation there was a loss of \$245,398 per year. The private company, however, charges no more than did the city, but supplies better gas. "The commission's records," say Mr. Edgar and Mr. Clark, "indicate a high degree of efficiency in the company operation of the Philadelphia gas-works, and kindly and liberal treatment of employees."

III. Private ownership being financially so much more successful than public ownership, it can and often does pay more in taxes to the government than public-owned plants bring in to the city. Messrs. Edgar and Clark say (see above):

We venture to believe that the loss to the communities whose municipal industries we have investigated from bad management and lack of enterprise, resulting in restricted service of modern utilities, is many times the profit these cities claim to have realized from their Rip Van Winkle methods of serving the public.

It is not worth while to discuss the effect on the finances of American cities of the municipal operations of the industries that we have here investigated. Properly audited, they have, with one or two exceptions, lost money, and their plants are all inadequate to good service and have, with the exception of the water plants, little more than a scrap value in view of the present state of the arts. What effect could such poor efforts as we have witnessed have on public wealth or public comfort? It cannot fail to be bad.

OBJECTIONS TO PRIVATE OWNERSHIP ANSWERED

In his review in the report of the National Civic Federation Commission on Public Ownership Mr. Clark compares the tramways of Great Britain

with the private enterprises of the U. S. He declares that the American traction systems under private ownership are far more progressive than those of England, Scotland, and Ireland; that they give far better suburban service, that cars are less crowded, and that lines are being extended with far greater rapidity. This he attributes to the absence of restrictions in the U. S. as compared with Great Britain, where, he says, private traction enterprises are given franchises only on almost prohibitive terms. The difference of rate of fare in the two countries, Mr. Clark says, is more than offset by the greater number of free transfers given by the American systems. He says that while on the fact of reports it would appear that municipal operation of lines in some of the cities of Great Britain had been a success, that as a matter of fact just the opposite is true. He says the private companies in the United Kingdom give a superior service as compared with the municipally operated lines.

Mr. Clark points out that no American street-railroads were investigated by the commission, and the only tramway installations directly investigated in Great Britain were those owned by the municipalities of Manchester, Liverpool, Glasgow, and the London County Council and those owned by the following private companies: London United Tramways, Dublin United Tramways, and the Norwich Electric Tramways. The writer calls attention to the fact that the entire development of street-railways in the U. S. has been accomplished by private enterprise and that this has permitted the construction of extensive systems serving entire communities and linking them together irrespective of municipal boundary lines. On the other hand, since 1894, at least, municipally controlled traction systems have been confined, to a great extent, within the narrow limits of their respective municipalities. Mr. Clark here enters into a statistical statement of the facilities enjoyed by the urban inhabitants of Great Britain as compared with the town and city population of the U. S. In 1902 the town and city population to each mile of tramway track was 12,476, while in the U. S. there was a mile of track to each 1,516 of town and city population. In Great Britain there was one car for each 3,760 of population, while in the U. S. there was one car to 574 city residents. Thus, the urban resident of the U. S. had comparatively more than six and a half times the number of cars available for his use than were available to the British inhabitant. The British systems carried 1,394,452,983 passengers and the American 5,521,509,521, and of these 1,062,403,392, or practically 90 per cent of the British total, were transported free on transfers.

Mr. Clark takes up the charge that the traction cars in the U. S. are overcrowded and declares that the figures given above show that on the basis of passengers carried per car per year, the American car averages only 93,585 passengers per year, as against 182,463 per year carried by the average car in the United Kingdom. While the Briton paid an average of 2.26 cents, against an average of 3.76 cents in the U. S., the writer points out that the former's facilities for travel were from 12 to 15 per cent of those enjoyed by the American passenger. In 1902 there were two British cities of more than 100,000 population, seven with populations of from 50,000 to 100,000, and thirty-nine with from 25,000 to 50,000 inhabitants, without street-railways, but in the

U. S. there was no city of more than 25,000 people without traction service.

From 1890 to 1902 the length of tramway line (not track) in the United Kingdom increased 536 miles, or from 948 to 1,484 miles, while in the U. S. in the same period there was an increase of 10,755 miles, or from 5,783 to 16,538 miles.

A point of great advantage in American street-railways, according to Mr. Clark, is that they are operated on the average eighteen hours per day, with all-night service in the larger cities, while in Great Britain the average is fifteen hours and there is no all-night service.

FINANCIAL

Mr. Clark estimates that the British municipalities and local governments enjoy a total of possible financial benefits from tramway operations of about \$8,679,176, but that American traction enterprises and their stockholders pay a total of \$43,054,433, constituting a government revenue more than \$34,000,000 per year greater than the return to the State from similar traction systems in Great Britain. The writer here takes up what he terms the inaccuracies of British municipal accounting. According to the Parliamentary Report on Tramways for 1906 the allowance for depreciation on the municipally owned tramways of the United Kingdom was 1.83 per cent. It is Mr. Clark's contention that every practical man realizes that at least 5 per cent should be allowed for depreciation, and if this had been done it would have meant a reduction of \$5,565,963 in the \$8,679,176 shown as the returns to the local and municipal governments of the United Kingdom from tramways, leaving net only \$3,113,213. Evidence that serious risks exist from municipal enterprises is found in the fact that forty British cities, according to the Parliamentary Return for 1906, show direct loss from operation of tramways, or an actual deficit when sinking-fund payments and reserves for depreciation are considered.

The British municipalities omit from the capital account of their tramways large sums which should be charged thereto and cause these expenditures to be "unjustly carried into the general accounts of the cities."

LABOR

A comparison of rates of wages per hour paid by British municipal traction systems and by certain companies in New York State is made by Mr. Clark, showing a range of from 7.2 to 15 cents per hour for conductors and from 8.4 to 15 cents per hour for motormen in Great Britain, against 20 to 25 cents per hour for conductors and motormen in the State of New York. "So it is seen," declares Mr. Clark, "that American street-railways pay practically double the rate for salaries and wages that are paid in the United Kingdom. In the State of New York a decrease of wages to British standard would reduce the operating expenses of local transportation lines about \$14,000,000 per annum, an amount equivalent to about 38 per cent of their gross receipts."

POLITICAL

Few Americans realize the obstacles which British private companies meet in attempting to obtain franchise rights, says Mr. Clark. The fact

that the consent of local authorities is required is used by the local authorities to force the companies, to make excessive payments, and even when a franchise is obtained, it is for a brief term of years, scarcely long enough to warrant the heavy expenditures required for modern electric-railway construction. Against this the municipalities at comparatively slight expense, obtain their parliamentary rights to perpetual and monopolistic franchises.

III. Conclusions

We give here, as the latest word thus far said upon the questions, the final conclusions of the Report of the Committee on Investigation of Public Ownership of the National Civic Federation. It is worthy of note that of the committeemen all but one, Walton Clark, of Philadelphia, who presented a separate paper, signed the report.

The members of the committee who signed the report are:

Melville E. Ingalls, chairman; Dr. Albert Shaw, editor of the *Review of Reviews*, vice-chairman; Edward A. Moffett, secretary; Edward W. Bemis, superintendent of Water-Works, Cleveland, Ohio; William J. Clark, general manager of the Foreign Department of the General Electric Company; Prof. John R. Commons, of Wisconsin University; Charles L. Edgar, president of the Edison Electric and Illuminating Company, of Boston; Walter L. Fisher, president of the Municipal Voters' League, of Chicago; Prof. Frank J. Goodnow, of Columbia University; Prof. John H. Gray, of Northwestern University, Illinois; Timothy Healy, president of the International Brotherhood of Stationary Firemen; Daniel J. Keefe, president of the International Longshoremen's Association; Milo R. Maltbie, member of the new Public Service Commission for the Greater New York; H. B. F. Macfarland, president of the Board of Commissioners of the District of Columbia; Frank J. McNulty, president of the International Brotherhood of Electrical Workers, Springfield, Ill.; Prof. Frank Parsons, president of the National Public Ownership League, Boston; J. W. Sullivan, editor *Clothing Trades Bulletin*, New York; Talcott Williams, editorial writer of the *Press*, Philadelphia; and Albert E. Winchester, superintendent of the South Norwalk, Conn., Electric Works.

THE REPORT

"It is difficult to give positive answers of universal application to the questions arising as to the success or failure of municipal ownership as compared with private ownership. The local conditions affecting particular plants are in many cases so peculiar as to make a satisfactory comparison impossible, and it is very difficult to estimate the allowance that should be made for these local conditions. For instance, in making deductions from the financial conditions of Wheeling, as affected by its gas-plant, as compared with those of Atlanta and Norfolk with their private plants, allowance must be made for the presence of natural gas in Wheeling. Again, in comparing the public water-works of Syracuse with the private water-works of Indianapolis from the point of view of the success or failure of municipal operation, geographical conditions must be taken into consideration. The situation at Syracuse is extremely favorable to the establishment of an efficient plant with comparatively little effort on the part of its management. At Indianapolis the conditions are unfavorable. In Syracuse the water flows to the city by gravity; in Indianapolis it must be pumped. So we might go through the various cities here and abroad that have been visited and show that the results were affected favorably or unfavorably by special conditions applicable to each city.

"Further, the difficulty of reaching satisfactory results by the comparative method is not con-

fined to special or local conditions. It is true, as well, of much broader questions. Thus any attempt to compare municipal with private electric-light plants in the United States would be fruitless if allowance were not made for the fact that in most cases such municipal plants are confined to street lighting and may not do commercial business. Allowance must be made also for the fact that many municipal plants have had a struggle to exist in the face of unsympathetic public opinion. Again, in England consideration must be given to the fact that the municipal electric-light and street-railway plants have permanent rights, while the rights of the private companies operating these particular utilities are limited as to the length of their existence, many street-railway franchises expiring twenty-one years after they were granted.

"Finally, not only must it be borne in mind that the social and political conditions which characterize the two countries find expression in their private and public systems, but we must consider the difference in the nature of the two peoples which causes them to adopt different ideas and views as to the expediency of certain things. In other words, a measure of success in the municipal management of public utilities in England should not be regarded as necessarily indicating that the municipal management of the same utilities in this country would be followed by a like measure of success. Conditions are quite different in the two countries.

"There are some general principles which we wish to present as practically the unanimous sentiment of our committee.

"First, we wish to emphasize the fact that the public utilities studied are so constituted that it is impossible for them to be regulated

General Principles

by competition. Therefore, they must be controlled and regulated by the government; or they must be left to do as they please; or they must be operated by the public. There is no other course. None of us is in favor of leaving them to their own will, and the question is whether it is better to regulate or to operate.

"There are no particular reasons why the financial results from private or public operation should be different if the conditions are the same. In each case it is a question of the proper man in charge of the business and of local conditions.

"We are of the opinion that a public utility which concerns the health of the citizens should not be left to individuals, where the temptation of profit might produce disastrous results, and therefore it is our judgment that undertakings in which the sanitary motive largely enters should be operated by the public.

"We have come to the conclusion that municipal ownership of public utilities should not be extended to revenue-producing industries which do not involve the public health, the public safety, public transportation, or the permanent occupation of public streets or grounds, and that municipal operation should not be undertaken solely for profit.

"We are also of the opinion that all future grants to private companies for the construction and operation of public utilities should be terminable after a certain fixed period, and that meanwhile cities should have the right to purchase the property for operation, lease, or sale, paying its fair value.

"To carry out these recommendations effect-

ively and to protect the rights of the people, we recommend that the various states should give to their municipalities the authority, upon popular vote under reasonable regulations, to build and operate public utilities, or to build and lease the same, or to take over works already constructed. In no other way can the people be put upon a fair trading basis and obtain from the individual companies such rights as they ought to have. We believe that this provision will tend to make it to the enlightened self-interest of the public utility companies to furnish adequate service upon fair terms, and to this extent will tend to render it unnecessary for the public to take over the existing utilities or to acquire new ones.

"Furthermore, we recommend that provision be made for a competent public authority, with power to require for all public utilities a uniform system of records and accounts, giving all financial data and all information concerning the quality of service and the cost thereof, which data shall be published and distributed to the public like other official reports; and also that no stock or bonds for public utilities shall be issued without the approval of some competent public authority.

"We also recommend the consideration of 'the sliding scale,' which has proved successful in some cases in England with reference to gas and has been adopted in Boston. By this plan the authorized capitalization is settled by official investigation, and a standard rate of dividend is fixed, which may be increased only when the price of gas has been reduced. The subway contracts and their operation in Boston and New York are also entitled to full consideration.

"In case the management of public utilities is left with private companies, the public should retain in all cases an interest in the growth and profits of the future, either by a share of the profits or a reduction of the charges, the latter being preferable as it inures to the benefit of those who use the utilities, while a share of the profits benefits the taxpayers.

"Our investigations teach us that no municipal operation is likely to be highly successful that does not provide for:

"First. An executive manager with full responsibility, holding his position during good behavior.

"Second. Exclusion of political influence and personal favoritism from the management of the undertaking.

"Third. Separation of the finances of the undertaking from those of the rest of the city.

"Fourth. Exemption from the debt limit of the necessary bond issues for revenue-producing utilities, which shall be a first charge upon the property and revenues of such undertaking.

"We wish to bring to your consideration the danger here in the U. S. of turning over these public utilities to the present government of some of our cities. Some, we know, are well governed and the situation on the whole seems to be improving, but they are not up to the government of British cities. We found in England and Scotland a high type of municipal government, which is the result of many years of struggle and improvement. Business men seem to take a pride in serving as city councilors or aldermen, and the government of such cities as Glasgow, Manchester, Birmingham, and others includes many of the best citizens of the city. These

conditions are distinctly favorable to municipal operation.

"In the U. S., as is well known, there are many cities not in such a favorable condition. It is charged that the political activity of public-service corporations has in many instances been responsible for the unwillingness or inability of American cities to secure a higher type of public service. This charge we believe to be true. However, there seems to be an idea with many people that the mere taking by the city of all its public utilities for municipal operation will at once result in ideal municipal government through the very necessity of putting honest and competent citizens in charge. While an increase in the number and importance of municipal functions may have a tendency to induce men of a higher type to become public officials, we do not believe that this of itself will accomplish municipal reform. We are unable to recommend municipal ownership as a political panacea.

"In many cases in the U. S. the people have heedlessly given away their rights and reserved no sufficient power of control or regulation, and we believe that corruption of public servants has sprung, in large measure, from this condition of things. With the regulations that we have advised, with the publication of accounts and records and systematic control, the danger of the corruption of public officials is very much reduced."

The committee sums up its more important conclusions as follows:

"Public utilities, whether in public or private hands, are best conducted under a system of legalized and regulated monopoly.

"Public utilities in which the sanitary motive largely enters should be operated by the public.

"The success of municipal operation of public utilities depends upon the existence in the city of a high capacity for municipal government.

"Franchise grants to private corporations should be terminable after a fixed period and meanwhile subject to purchase at a fair value.

"Municipalities should have the power to enter the field of municipal ownership upon popular vote under reasonable regulation.

"Private companies operating public utilities should be subject to public regulation and examination under a system of uniform records and accounts and of full publicity."

On the general broad subject of municipalization, the committee reports that the general expediency of either private or public ownership is a question that must be determined by each municipality in the light of local conditions. "What may be possible in one locality may not be in another. In some cities the companies may so serve the public as to create no dissatisfaction, and nothing might be gained by experimenting with municipal ownership. Again, the government of one city may be good and capable of taking charge of these public utilities, while in another it may be the reverse. In either case the people must remember that it requires a large class of able men as city officials to look after these matters. They must also remember that municipal ownership will create a large class of employees who may have more or less political influence."

PUBLIC OWNERSHIP, PHILOSOPHY OF:

If it is a good thing for ten or fifteen hundred people constituting a private company to own a street-railway or lighting system, why is it not a good thing for 10,000 or 15,000 or 100,000 people constituting a city or town—if it is a good thing for a private corporation, why is it not a good thing for a public corporation?

Under public ownership the public gets the profits and control and other benefits that under private ownership go to a few stockholders.

By "public ownership" I mean real public ownership, not the sham variety or make-believe public ownership. Government ownership is often confused with public ownership.

Government ownership is not public ownership, unless the people own the government. For instance, Russia has government ownership of railroads, but not public ownership of railroads, because the government itself is a private monopoly. So, if a boss or ring controls a city, the government is in fact a private monopoly, and if a street-railway or lighting plant is put in the hands of such a government, you would not get real public ownership, but one of the worst forms of private ownership—ownership by political grafters, corporation tools and corruptionists, masquerading as public servants. Municipal ownership has not as yet had a fair chance in the United States. Adverse laws, the prevalence of the spoils system, and the political influence of private corporations have handicapped the movement in this country. More

than a thousand towns and cities own and operate electric-lighting plants, but very few of them are allowed to do commercial lighting, which, if permitted, would very greatly reduce the cost of the service. Only twenty-nine gas plants of any size are operated by municipalities, and in a number of cases the fullest success is prevented by the interference of partizanship politics and the spoils system. Only one street-railway in this country, that of Munroe, La., is operated by the public. In water-supply alone have our cities and towns been able to overcome the obstacles placed by law, politics, and the corporations in the way of municipal ownership. If the companies are allowed to water their stock, they are willing that the municipalities should water their streets. Municipal owner-

Public Ownership Definition

In the United States

ship of water-works in the U. S. grew from 6 per cent in 1800 to more than 60 per cent in 1900. Of our fifty largest cities, twenty-one originally built and now own their water-works, twenty have changed from private to public ownership, and only nine are now dependent on private companies for their water-supply.

In Great Britain the laws have been far more favorable to municipal ownership, and the political influence of the private corporations far less. The result has been a marvelous development of public ownership. More than half the gas-supply outside of London is in public hands.

Nearly two thirds of the electric-lighting plants belong to the municipalities, and about half the street-railway undertakings are owned and operated by municipalities, with nearly 60 per cent of the total track mileage.

After long experience with both public and private ownership, public sentiment in Great Britain is overwhelmingly in favor of the public operation of street-railways and lighting-plants. There is still some opposition, of course, chiefly from those who are, directly or indirectly, connected with public-service corporations. It is not easy for a man who

holds stock in a street-railway, gas or electric-lighting company, to see the benefits of public ownership.

Careful and disinterested investigation shows public ownership of public utilities, under fair conditions, to be far superior to private ownership, both on principle and on the facts. The facts fall into six groups: The economic group, including service and finance; the labor group; the political group; the social group; the ethical group; and the civilization group.

Looking first at the economic facts we find that public ownership makes lower rates than private ownership in the same country and operating

under similar conditions. In 1895 Detroit was paying \$132 a year for a standard arc lamp of 2,000 candle-power, burning all night and every night, and Boston was paying \$126 per arc. Detroit, under Mayor Pingree's lead, established a municipal street-lighting system which cut the cost at once to \$83 and has now reduced the cost to \$52.87, including interest depreciation and lost taxes, according to the report for 1907. The lowest bid a company would make for a ten-year contract was \$102. The city made its light at an average total cost of \$65 per arc for the ten years and made a saving which is estimated by the department at about a million dollars, and amounts to at least \$500,000 on the basis of estimate least favorable to the city. Boston did not establish municipal ownership and is still paying almost as much for street arcs as she paid twelve years ago—\$124 per standard arc; while Detroit is getting her light for \$52.87, or a great deal less than half the Boston rate.

On the average, water rentals per family served are 43 per cent more for private works in the United States than for the public systems.

When the government took over the telephones in France, the price was cut from \$120 to \$80 in Paris and from \$80 to \$40 in other cities. The government returns for electric-lighting works in Great Britain show average charges of 4.88 cents per unit for the public plants, against

6.24 cents for the companies, or 30 per cent more than for the public works, and the gas returns for the United Kingdom show a charge of sixty cents per thousand for the public plants and sixty-six cents per thousand for the private plants, or 10 per cent in favor of the municipalities. The municipalization of street-railways in Great Britain has resulted in a great reduction of fares—50 per cent in Glasgow and Manchester, 40 per cent in Leeds, 60 per cent in Sheffield, 50 to 60 per cent in Liverpool, etc.

The savings to the public through reduction of fares in Liverpool are estimated at \$1,600,000 a year, and in Glasgow at \$4,000,000 a year; the total savings and net profits for twelve years of municipal ownership in Glasgow are estimated at \$29,000,000.

The extension of lines and increase of facilities are among the marked characteristics of the change from private to public operation. In Glasgow, for instance, during twenty-three years of company management of street-railways the lines were extended in suburban areas only 1.8 miles, while during twelve years of municipal management the suburban extensions amount to 27.9 miles.

Municipal plants aim at fair capitalization, while private companies are prone to water stock and inflate their capital. The investigation by the Public Utilities Commission now

in progress in New York has furnished some excellent examples of the methods of our public-service corporations.

The Fulton Street line, a double-track horse-car road, is capitalized at \$2,553,000 a mile, or more than ten times its actual cost. The Twenty-eighth and Twenty-ninth Street single-track horse-car lines are capitalized at \$1,214,000 a mile, or again substantially ten times the cost of duplication. The Thirty-fourth Street cross-town double-track electric underground is capitalized at \$6,472,000 a mile, or 150 times fair value, judging by the capitalization of the Ninth Avenue Railroad, which is also underground electric double-track and is capitalized at \$43,920 a mile. The Fulton, Wall & Cortlandt Street Ferries Railroad is capitalized at \$965,607, tho the road was sold in 1898 for \$25,000 and not a car has ever been run nor a rail laid—a phantom road with its capital all in the air.

Municipal systems pay higher wages as a rule and work employees shorter hours than private systems. Glasgow's tramways, for example, have raised wages 65 to 100 per cent above the former company level. Manchester has increased wages 43 to 63 per cent. Sheffield doubled the hourly wage; and Liverpool lifted wages 50 per cent.

The following table shows how great a reduction in the hours of labor of conductors, drivers, motormen, pointsmen, and inspectors has been accomplished by the change from private to public ownership of street-railways in Great Britain.

HOURS OF LABOR—BEFORE AND AFTER

| CITIES | Company management | Municipal management |
|-----------------|--------------------|----------------------|
| London..... | 77 to 91 | 60 |
| Liverpool..... | 91 to 105 | 60 |
| Manchester..... | 70 | 54 |
| Glasgow..... | 77 to 98 | 54 |
| Leeds..... | 81 | 50 |
| Sheffield..... | 102 | 60 |
| Birmingham..... | 90 to 100 | 60 |

In spite of high wages and reduced charges public plants in many cases are able to realize large profits for the people; the State railways of Prussia, for example, and the tramways of Glasgow, Manchester, Liverpool, and other British cities. The Glasgow tramways alone make a profit of \$2,000,000 a year (1907 report) above the cost of operation, and \$1,125,000 net above interest, depreciation, and all other costs.

Large Profits in Public Plants

Some public plants do not make or expect to make a profit, any more than a profit is expected from public roads, parks, schools, etc. Many electric-lighting plants, for instance, have only power to light the streets, and can of course obtain no profit. Many public lighting and transit systems also are in small places where no profit can be made and where private companies would not establish a service at all.

Public ownership not only tends to make low rates—rates closer to cost than private companies are likely to make—but public operation under fair political conditions tends also to reduce the cost, the normal public plant being able to secure considerable economies in production.

1. A public plant does not have to pay dividends on watered stock.

2. It does not have to pay dividends even on the actual investment.

3. It does not have to retain lobbyists, or provide for the entertainment of councilmen or legislators, or subscribe to campaign funds, or bear the expenses of pushing the nomination and election of men to protect its interests or give it new privileges, or pay blackmail to ward off the raids of cunning legislators and officials, etc.

4. It does not have to advertise or solicit business.

5. Public plants are able to save expense through coordination with other departments of public service.

6. Municipalities can borrow money at lower rates of interest than the private companies have to pay.

7. There is often a large saving in salaries. A public plant pays its chief well, but does not pay the extravagant salaries awarded by millionaire monopolists to themselves or their substitutes in office.

8. Public plants frequently gain through the higher efficiency of better treated and more contented labor.

9. The losses occasioned by costly strikes and lockouts do not burden the ledgers of public works.

10. Damages and costs of litigation are likely to be less with public than with private works. Accidents are fewer in a system that aims at good service and safety, and treats its employees well.

11. The civic interest of the people leads to other economies through the increase of patronage and the lessening of waste.

12. The cost of numerous regulative commissions and interminable legislative investigations into the secrets of private monopolies would be saved by the extension of public ownership. And legislation itself would cost us less were it not for the private monopolies. For a large part of the time and attention of our legislatures is given to them.

Private ownership may claim an advantage through the payment of lower wages, but on broad grounds of public policy this is a very dubious advantage. It is like saving money by wearing paper clothes, or eating only one meal a day.

Even on economic grounds the evidence is that in many lines of business the efficiency of well-paid labor is so great that the cost per unit of product is less than with poorly paid labor.

Moreover, it would be fair in many cases to compare municipal ownership with private ownership on the basis of the private wage, subtracting from the operating expenses of the municipal plant the excess of the public wage above the company wage for the same work, on the ground that the increase of pay under public ownership is not really a payment for gas or electric light or transportation, but an investment in manhood and civilization.

But whether this is done or not, the experience of Glasgow, Liverpool, and other English and German cities with municipal and private tramways in the same localities, and the experience of hundreds of cities and towns in this country and in Europe with municipal water-works, gas and electric plants, etc., abundantly confirms the conclusion pointed to by the above considerations as to the superior economy of public ownership wherever it is tried under reasonable conditions that permit it to work out its natural and legitimate results.

Public ownership of public utilities widens the sphere for civic activity and develops a higher type of citizenship, whereby political conditions have been much improved in communities sufficiently advanced to respond to the impulse of the increased weight and importance of public business. The public-ownership movement in Great Britain has formed a very important part of the causes that have abolished the corruption and inefficiency which formerly marked municipal government in that country.

In the United States the political argument is one of the most powerful reasons for public ownership. It removes one of the principal causes of corruption in our larger cities. It transfers to the side of good government the financial interest of rich and influential men who, as stockholders in public-service corporations, are led to aid and abet, or at least wink at the election of men who can be controlled by the corporations.

The social argument for public ownership rests upon its tendency to improve the conditions of labor, secure a better diffusion of wealth and power, and develop finer relationships among men. The interests of the stockholders and managers of public-service companies are, in large measure, opposed to the public interest under private ownership, while under public ownership they are in harmony, for the owners and the public are one and the same.

The ethical argument for public ownership is already foreshadowed in what precedes. A system which develops thought and action antagonistic to the public interest is not in accord with ethical principles.

See articles MUNICIPAL OWNERSHIP and PUBLIC OWNERSHIP.
FRANK PARSONS.

PULLMAN STRIKE, THE: This strike, sometimes also called the Chicago strike because, tho it began in Pullman, it extended very widely and centered mainly in Chicago, is declared by Mr. Carroll D. Wright ("Industrial Evolution of the United States," p. 313) to be "probably the most expensive and far-reaching labor controversy which can properly be classed among the historic controversies of this generation."

This account of the strike is based upon the findings of the report of the commission appointed by the president July 26, 1894, to investigate the strike.

It began May 11, 1894, and grew out of a demand of certain employees of the Pullman Company for a restoration of the wages paid during the previous year. During 1893 the wages of the employees had been considerably reduced. How much is a matter of dispute. According to the statement before the commission of Mr. T. H. Wickes, the second vice-president of the company:

Cause of Strike

The average reduction of wages between April, 1893, and April, 1894, for journeymen mechanics was 22½ per cent, and the average reduction for all other shop employees, excluding all the superintendents, foremen, and shop-office force, was 11½ per cent. The average reduction for all shop employees, excluding all the superintendents, foremen, and shop-office force, was 19 per cent.

According to the finding of the commission the cut in wages averaged 25 per cent on an average pay for the year ending July 1, 1893, of \$613.86 for 4,497 employees. At the company's figures the reduction was a very serious one. Says the report: "Some witnesses swear that at times

for the work done in two weeks the employees received in checks from four cents to \$1 over and above their rent. The company has not produced its checks in rebuttal."

The cause for the cut-down assigned by the company was the depretest state of business. Said Mr. Wickes before the commission:

From Aug. 1, 1893, to May 1, 1894, our net loss on accepted bids was \$52,069.03, and the net estimated loss on unaccepted bids was \$18,303.56. We had tried to get work for our employees by bidding for work the estimated shop cost of which was \$2,775,481.81, and we only got contracts for work the estimated shop cost of which is \$1,421,205.75. We had been underbid on work the estimated shop cost of which was \$1,354,376.06, notwithstanding that our bids on \$1,037,355.97 of that amount not only excluded all profit, but showed a loss, based as they were on the reduced scale of wages.

Says the commission's report:

Some reduction of wages in all departments was of course proper under the circumstances, but a uniform reduction as between departments so differently situated in reference to revenue as the car-building and repair departments was not relatively just and fair toward the repair-shop employees. . . .

During all of this reduction and its attendant suffering none of the salaries of the officers, managers, or superintendents were reduced. Reductions in these would not have been so severely felt, would have shown good faith, would have relieved the harshness of the situation, and would have evinced genuine sympathy with labor in the disasters of the times. . . .

While reducing wages the company made no reduction in rents. Its position is that the two matters are distinct, and that none of the reasons urged as justifying wage reduction by it as an employer can be considered by the company as a landlord.

The company claims that it is simply legitimate business to use its position and resources to hire in the labor market as cheaply as possible, and at the same time to keep rents up regardless of what wages are paid to its tenants or what similar tenements rent for elsewhere; to avail itself to the full extent of business depression and competition in reducing wages and to disregard these same conditions as to rents. No valid reason is assigned for this position except simply that the company had the power and the legal right to do it.

The company, as a whole, was prosperous. The commission's report says the corporation was

organized in 1867, with a capital of \$1,000,000. It has grown until its present paid-up capital is \$36,000,000. Its prosperity has enabled the company for over twenty years to pay 2 per cent quarterly dividends, and, in addition, to lay up a surplus of nearly \$25,000,000 of undivided profits. From 1867 to 1871 dividends ranging from 93 to 12 per cent per annum were paid. For the year ending July 31, 1893, the dividends were \$2,520,000, and the wages \$7,223,719.51. For the year ending July 31, 1894, the dividends were \$2,880,000, and the wages \$4,471,701.39.

The reply of the company was that it did allow rents to accumulate in arrears, and that as to the business depression and loss it did bear

its full share by eliminating from its estimates the use of capital and machinery, and in many cases going even below that and taking work at considerable loss, notably the fifty-five Long Island cars, which was the first large order of passenger-cars let since the great depression, and which was sought for by practically all the leading car-builders in the country (statement of Mr. Pullman, Chicago *Herald*, June 26, 1894).

This leads us, however, to consider the relation of the strikers at Pullman to the American Railway Union and the general railway strike that resulted.

THE AMERICAN RAILWAY UNION (q. v.)

This is an association of railroad employees, organized at Chicago on June 20, 1893, for the purpose of including all railway employees born of white parents in one great brotherhood. Under the leadership of Mr. Eugene V. Debs, it had grown very strong, particularly by winning a strike on the Great Northern. In March, 1894,

the Pullman employees voted to join the American Railway Union. The commission report says this was not wise, but adds:

It is undoubtedly true that the officers and directors of the American Railway Union did not want a strike at Pullman, and that they advised against it, but the exaggerated idea of the power of the union, which induced the workmen at Pullman to join the order, led to their striking against this advice. Having struck, the union could do nothing less, upon the theory at its base, than support them.

There was, however, to say the least, some excuse for the American Railway Union to secure the Pullman men. The railways around Chicago were banded together. Wages were being systematically reduced. If all railroad employers were to band together, it seemed necessary for all railway employees to band together. To the Pullman employees, to join the American Railway Union seemed their one chance of victory. Alone they were helpless and hopeless. Wages were being steadily reduced, below the level of existence. Those who criticize the general strike must remember that it was a battle for life, and the one hope of success. A mere local strike was absolutely without hope, and therefore more foolish than a general strike. The General Managers' Association, representing twenty-four roads centering or terminating in Chicago, was organized in 1886, long before the American Railway Union.

Beginning its "active life" in 1886, its main business was to determine a common policy toward the public as to freight rates, etc., but it dealt incidentally with wages.

Strengthened thus by mutual aid, various roads made reductions of wages here and there.

Thus, to say the least, there was some excuse for the railroad employees of the country banding together. It was not a question of Pullman alone. The strike affected the interests of every railroad man in the country. Without the general resistance they made, wages everywhere, under the depretest condition of business, would have been lowered much more than they were.

The Pullman Car Company, however, refused to recognize the American Railway Union.

Between June 9th and June 26th a regular convention of the American Railway Union was held with open doors at Chicago, representing 465 local unions and about 150,000 members, as claimed. The Pullman matter was publicly discussed at these meetings before and after its committees above mentioned reported their interviews with the Pullman Company. On June 21st the delegates, under instructions from their local unions, unanimously voted that the members of the union should stop handling Pullman cars on June 26th unless the Pullman Company would consent to arbitration. On June 26th the boycott and strike began. The strike on the part of the railroad employees was a sympathetic one. No grievances against the railroads had been presented by their employees, nor did the American Railway Union declare any such grievances to be any cause whatever of the strike. To simply boycott Pullman cars would have been an incongruous step for the remedy of complaints of railroad employees. Throughout the strike the strike was simply over handling Pullman cars, the men being ready to do their duty otherwise.

After June 26th the officers and agents of the union managed and urged on the strike at every available point upon the railroads centering at Chicago, until it reached proportions far in excess of their original anticipations, and led to disorders beyond even their control. Urgent solicitations and appeals to strike and to stand firm continued in the many public meetings held each day in and about Chicago, and appeared in the telegrams sent about the country. . . .

The General Strike

Bradstreet's estimated the losses to the country at large to be about \$80,000,000. The city police, the county sheriffs, the state militia, United States deputy marshals, and regulars from the

U. S. army were all brought into the controversy. The U. S. troops were sent to Chicago to protect federal property and to prevent destruction in the carrying of the mails, to prevent interference with interstate commerce, and to enforce the decrees and mandates of the federal courts. They took no part in any attempt to suppress the strike, nor could they, as such matters belong to the city and state authorities. The police of the city were used to suppress riots and protect the property of citizens, and the state militia was called in for the same service. The total of these forces employed during the continuance of the strike was 14,186. It was claimed by some that the calling out of the federal troops was unnecessary and an invasion of state rights; they being called out simply to please the corporations and intimidate the strikers.

Another element that entered into the matter was the issue of injunctions (*q. v.*). Says the report:

On July 7th the principal officers of the American Railway Union were indicted, arrested, and held under \$10,000 bail. Upon July 13th they were attached for contempt of the U. S. Court in disobeying an injunction issued on July 2d and served on the 3d and 4th, enjoining them, among other things, from compelling or inducing by threats, intimidation, persuasion, force, or violence, railroad employees to refuse or fail to perform their duties. It is seriously questioned, and with much force, whether courts have jurisdiction to enjoin citizens from "persuading" each other in industrial or other

matters of common interest. However, it is generally recognized among good citizens that a mandate of a court is to be obeyed until it is modified and corrected by the court that issued it.

As a result, Debs and his comrades were convicted of contempt of court, and, without jury trial, imprisoned (see *DEBS*); the friends of the railroads believing that it "served the strikers right"; others believing it a dastardly and dangerous attack on the right of every man to trial before jury.

July 26, 1894, the president appointed a commission consisting of Carroll D. Wright, John D. Keenan of New York, and Nicholas E. Worthington of Illinois, who heard evidence and testimony as to the causes, facts, and lessons of the strike. The report so favored the strikers that it was described in *Harper's Weekly*, Nov. 24, 1894, as "Revolutionary Statesmanship." As a result a bill for arbitration in railway strikes was laid before Congress, for an account of which, see *STRIKES*.

REFERENCES: *Report on the Chicago Strike of June and July, 1894*, by the U. S. Strike Commission, 1895; *The Pullman Company's Statement* (1894). Both of these, and an analysis by Prof. W. J. Ashley of Harvard, with a complete bibliography of the strike, were collected and published by the Church Social Union in 1895.

Q

QUELCH, HENRY: English Socialist; editor of *Justice*; born 1858, Hungerford, Berkshire. He went to London in 1872. Worked in various occupations. In connection with the great dock strike of 1880, he organized and was the first secretary of the South Side Labor Protection League, resigning the secretaryship in 1892 in order to take the position he at present occupies. Has several times been unsuccessful candidate for Parliament. He has been arrested and prosecuted for his connection with strikes and labor agitation. Has been a member of every International Socialist Congress since 1889. Mr. Quelch is a Social Democrat and Marxist, and from its formation in 1881 has been a member of the Social Democratic Federation in England. Author: Various pamphlets, "Trades-Unionism, Cooperation, and Social Democracy"; "Economics of Labor"; "Social Democracy and the Armed Nation," etc. Address: 37A Clerkenwell Green, London, E. C., England.

QUESNAY, FRANÇOIS: Political economist; born Mérey, France, 1694. Studying medicine at Paris, became first physician to Louis XV.; was even more famous as an economic thinker, and one of the principal founders of the school of the physiocrats (*q. v.*) and coiner of the term political economy. He died at Versailles in 1774. Dr.

Ingram says of Quesnay in his "History of Political Economy":

The publications in which Quesnay expounded his system were the following: Two articles on "Fermiers" and on "Grains" in the "Encyclopédie" of Diderot and D'Alembert (1756, 1757); a discourse on the law of nature in the "Physiocratie" of Dupont de Nemours (1768); "Maximes Générales de Gouvernement Économique d'un Royaume Agricole" (1758), and the simultaneously published "Tableau Économique avec son Explication, ou Extrait des Économies Royales de Sully" (with the celebrated motto, "pauvres paysans, pauvre royaume; pauvre royaume, pauvre roi"); "Dialogue sur le Commerce et les Travaux des Artisans"; and other minor pieces. The "Tableau Économique," tho on account of its dryness and abstract form it met with little general favor, may be considered the principal manifesto of the school. It was regarded by the followers of Quesnay as entitled to a place among the foremost products of human wisdom, and is named by the elder Mirabeau, in a passage quoted by Adam Smith, as one of the three great inventions which have contributed most to the stability of political societies, the other two being those of writing and of money. Its object was to exhibit by means of certain formulas the way in which the products of agriculture, which is the only source of wealth, would in a state of perfect liberty be distributed among the several classes of the community (namely, the productive classes of the proprietors and cultivators of land, and the unproductive class composed of manufacturers and merchants), and to represent by other formula the modes of distribution which take place under systems of governmental restraint and regulation, with the evil results arising to the whole society from different degrees of such violations of the natural order. It follows from Quesnay's theoretic views that the one thing deserving the solicitude of the practical economist and the statesman is the increase of the net product; and he infers also, what Smith afterward affirmed on not quite the same ground, that the interest of the landowner is "strictly and inseparably connected with the general interest of the society."

R

RAIFFEISEN, FRIEDRICH WILHELM: Founder of cooperative savings and loan associations in the country districts of Germany. (See COOPERATION.) Born 1818 in Hamin, he chose the military career, but entered the civil service, and became successively mayor in several small towns. In 1846-47 he established a *Konsum-Verein* in Weyerbusch. In 1865 he was pensioned, and devoted himself entirely to the expansion of savings and loan associations. He established the first one in 1849 at Flammersfeld to free the peasants from the tyranny of usurers. During the "sixties" he established many new societies, and coordinated them in a central bureau at Neuwed. Under his management the institution spread rapidly over Germany. (See COOPERATION.) In 1879 he founded a paper for the furtherance of his plans, which still exists. He died March 11, 1888, at Heddesdorf. Author of several works on savings and loan associations, e. g., "Die Darlehnskassenvereine als Mittel zur Abhilfe der Not der Ländlichen Bevölkerung," 1866.

RAILWAY ACCIDENTS. See RAILWAYS, page 1091; also AMERICAN RAILWAYS VS. THE PUBLIC, page 1054.

RAILWAY LABOR LEGISLATION (see also RAILWAYS and RAILWAY PROBLEMS).

THE UNITED STATES

The railway labor laws enacted by the various states and by the federal government have, with few exceptions, the object of protecting the health and safety and the rights of employees, and of reducing to a minimum the liability of the traveling public to accidents and inconvenience on account of acts of employees. They may be considered under five groups, namely: Laws (1) regulating the employment of certain classes of persons, (2) prohibiting certain acts of railway employees, (3) protecting the rights of railway employees, (4) requiring certain mechanical equipment on railways for the protection of the health and safety of employees, (5) concerning the reporting and investigating of accidents to employees.

Some of the laws included in the third, fourth, and fifth groups have received the attention of the federal Congress, and apply to all railways engaged in interstate commerce. In all other cases the laws apply only to railway labor within the borders of those states in which the laws have been enacted.

Most of the railway labor laws apply only to steam-railways, but there are others which apply, or may be construed as applying, also to street-railways. Others apply only to street-railways. In this outline these laws are considered together.

The laws concerning employment are enacted to secure the appointment of proper persons in positions of responsibility and to prevent them from becoming incapacitated from overwork while on duty.

To this end the law of Alabama requires the examination and licensing of train dispatchers, conductors, firemen, flagmen, brakemen, trackmen, and switchmen. In Massachusetts and Ohio employees in positions which require them to distinguish form or color signals must be examined for color-

blindness or defective sight, and be supplied with certificates of qualification. In Georgia telegraph operators must be examined and obtain certificates of competency. In Ohio conductors of trains must have had at least two years' experience as conductors or brakemen, locomotive engineers three years' experience as locomotive firemen, and flagmen two years' experience as brakemen. In New York persons employed as motormen or gripmen must be examined and thoroughly instructed, and in Washington they must have at least three days' instruction before being permitted to take charge of cars. In Minnesota and New York illiterates are prohibited from being employed or from accepting employment as locomotive engineers. In Colorado, Georgia, and New York telegraph operators who are entrusted with the transmission of orders for the movement of trains must be at least eighteen years of age and have one year's experience as telegraph operators.

Statutes limiting the hours of labor of railway employees have been enacted in twenty-three states. The states of Arkansas, Colorado, Florida, Georgia, Indiana, Kansas,

Hours
of Labor

Michigan, Minnesota, Missouri, Nebraska, New York, Ohio, and Texas, and the Territory of Arizona have laws limiting the hours of labor on steam-railways. These laws take the form of prescribing the number of hours of rest that must be allowed conductors, engineers, firemen, and other trainmen on railroads, exceptions being generally made in cases of extraordinary emergencies. In Colorado and Georgia 10 hours' rest must be permitted after 16 and 13 hours of continuous service, respectively. In Arizona and Minnesota the period of rest is 9 hours. In all the other states it is 8 hours. In Florida the prescribed period of rest must be granted after 13 hours of continuous service; in Minnesota after 14 hours; in Ohio after 15 hours; in Arizona, Arkansas, Indiana, Kansas, Missouri, and Texas after 16 hours; in Nebraska after 18 hours, and in Michigan and New York after 24 hours.

In New York 10 hours constitute a legal day's labor in the operation of steam-railways, extra compensation being required for overtime. This provision does not apply where the mileage system of running trains is in operation.

The second group consists of laws passed for the purpose of protecting the railroad companies and the public from such acts of carelessness, violence, or inattention to duty on the part of employees as might endanger life or property or cause inconvenience to the public. The penalties in these cases are usually severe, the offenses being sometimes regarded as felonies.

Twenty-three states and territories have passed laws providing penalties of from a few months' to fifteen years' imprisonment, or fines ranging from \$50 to \$5,000, for acts of negligence, carelessness, want of skill, disobedience of orders, etc., on the part of engineers, conductors, brakemen, switch-tenders, train dispatchers, telegraph operators, motormen on street-railways, or other persons in the railway service, resulting in death or injury to persons or property.

Acts of
Railway
Employees

In Illinois a penalty is provided for negligently injuring or frightening horses, etc., or destroying or injuring trunks and other baggage by baggage-masters, express agents, stage-drivers, etc.

Of the various subjects considered under this head that of intoxication of railway employees has received the most attention by the different legislatures, twenty-seven states and territories having passed laws on this subject. In most of these states the laws provide that locomotive engineers, conductors, switch-tenders, train dispatchers, or other persons in charge of locomotives, trains, cars, or switches who are intoxicated while on duty are guilty of a misdemeanor. In Mississippi and Vermont this act is made a felony. In California and Missouri it is a felony if an accident results or life or property is endangered. In Illinois, Michigan, and Vermont the employment as conductors, engineers, etc., of persons addicted to drinking intoxicating beverages is prohibited. In a number of states the laws concerning intoxication also apply to motormen and drivers on street-cars.

The remaining laws coming within this group are directed against acts of employees in furtherance of strikes or other labor disputes which might result in injury to property or danger or inconvenience to the public. In seven states it is a misdemeanor for persons in charge of locomotives, cars, or trains to abandon them at any point other than their destination. In nine states it is a misdemeanor to obstruct, injure, or delay transportation by violence, intimidation, or other interference with employees. In four states it is a misdemeanor for employees in furtherance of strikes or other

disputes on other roads to refuse to move the locomotives or cars of those roads.

A number of states have enacted special laws for the safeguarding of the interests of employees.

Twelve states make the railroad companies liable for the wage debts of contractors.

The statutes concerning the wages

of railway employees are considered in the chapter on wages.

**Rights of
Railway
Employees** A federal statute of June 1, 1898, relating to the arbitration of labor disputes between common carriers engaged in interstate commerce and their employees, has the following provisions concerning the rights of employees:

Sec. 9. Whenever receivers appointed by federal courts are in the possession and control of railroads, the employees upon such railroads shall have the right to be heard in such courts upon all questions affecting the terms and conditions of their employment, through the officers and representatives of their associations, whether incorporated or unincorporated, and no reduction of wages shall be made by such receivers without the authority of the court therefor upon notice to such employees, said notice to be not less than twenty days before the hearing upon the receivers' petition or application, and to be posted upon all customary bulletin boards along or upon the railway operated by such receiver or receivers.

Sec. 10. Any employer subject to the provisions of this act, and any officer, agent, or receiver of such employer who shall require any employee, or any person seeking employment, as a condition of such employment, to enter into an agreement, either written or verbal, not to become or remain a member of any labor corporation, association, or organization; or shall threaten any employee with loss of employment, or shall unjustly discriminate against any employee because of his membership in such a labor corporation, association, or organization; or who shall require any employee or any person seeking employment, as a condition of such employment, to enter into a contract whereby such employee or applicant for employment shall agree to contribute to any fund for charitable, social, or beneficial purposes, to release such employer from legal liability for any personal injury by reason of any benefit received from such fund beyond the proportion of the benefit arising from the employer's contribution to such fund; or who shall, after having discharged an employee, attempt or conspire to prevent such employee from obtaining employment; or who shall, after the quitting of an employee, attempt or conspire to prevent such employee from obtaining employment, is hereby declared to be guilty of a misdemeanor, and, upon conviction thereof in any court of the United States of competent jurisdiction in the district in which such offense was committed, shall be punished for each offense by a fine of not less than \$100 and not more than \$1,000.

In Arkansas and Missouri it is a misdemeanor for any person to make false charges against a railway employee with regard to the receipt of money for fare, etc.

The State of Kansas has a statute making special provision by which railway employees may be enabled to vote in any part of the state when absent from the legal residence on railway business on election day.

In Massachusetts it is unlawful to divulge the names of railway employees who make complaints concerning safety appliances, etc.

The statutes coming within the fourth group are intended for the protection of the health and safety of railway employees. The dangerous character of their employment calls for legislation requiring such mechanical appliances as will reduce their liability to injury to a minimum. For this reason considerable attention has been given to this kind of legislation both by the federal Congress and by the different state legislatures.

The federal government has a law requiring all common carriers engaged in interstate commerce to supply their trains with automatic couplers and power brakes and certain other safety appliances, for minimizing danger.

In addition to the federal statute which governs common carriers engaged in interstate commerce, ten states have laws requiring automatic couplers on railway trains, fourteen states have laws requiring air or power brakes on locomotives and cars, three states have laws requiring grab-irons on sides of box cars, and one state has a law regulating the height of draw-bars on cars. These laws apply in some cases only to passenger trains, in some only to freight trains, and in others to all trains.

Thirteen states require the blocking of frogs, switches, and guard rails; eleven states require bridge guards or telltales at approaches to bridges, tunnels, etc.; ten states regulate the height of bridges and wires over railway tracks or trolley wires over street-car tracks; New York requires safety switches on main line tracks, and prohibits the use of "coal jimmies," and Vermont requires ladders or steps to be placed at the end or inside of cars. In Ohio full crews are required on freight and passenger trains, and in South Carolina there must be at least one brakeman to every two cars on passenger trains, except when power brakes are used, and one brakeman on the last car of every freight train. In Arizona, on grades of over ninety-five feet to the mile on mountain divisions, there must be at least one brakeman for every 600 tons. In Michigan printed copies of rules and regulations must be furnished to employees, and in New York and Ohio railroad companies are required to make reports to the railroad commissioners showing the number of safety appliances with which their roads have been equipped. Ohio prohibits the erection of any crane, chute, etc., within eighteen inches of the nearest point of contact with the cab of any locomotive. Arkansas requires the construction of shelters for workmen at division points.

Twenty-seven states have laws requiring street-railway companies to have enclosed platforms on the front of cars for the protection of motormen, gripmen, or drivers.

A federal law requires common carriers engaged in interstate commerce to make regular reports of accidents to the Interstate Commerce Commission.

Accidents In Alabama, Connecticut, Michigan, Mississippi, South Carolina, and Vermont accidents must be reported to the railroad commissioners. In Mississippi accidents causing delay or injuries must be telegraphed and a written report made afterward to the railway commission. In South Carolina accidents causing injury to persons must be reported immediately to an accessible physician and notice given in writing to the railway commissioners within twenty-four hours.

Four states have laws requiring railroad commissioners to investigate accidents to railway employees. Massachusetts has a law requiring railroad companies to run workmen's trains at specified hours of the day.

GREAT BRITAIN

In Great Britain the conduct of railway employees while on duty is regulated by an act passed in 1840 which provides that any engine-driver, guard, porter, or other employee of a railway company is liable to arrest for intoxication while on duty, or for committing any offense against the regulations, or for wilfully, maliciously, or negligently doing or omitting to do

any act whereby life, limb, or the works of the railway are endangered. The penalty may be imprisonment, either with or without hard labor, for a term not exceeding two months, or a fine of not more than £2 (\$9.73).

The hours of labor of railway employees are not fixed by law, but an act passed July 27, 1893, provides that the Board of Trade is authorized to investigate representations that the employees of any railway company are required to work for an excessive number of hours, or that sufficient intervals of rest are not allowed, or that insufficient relief is afforded in the matter of Sunday labor. If the investigation discloses reasonable grounds for complaint, the Board of Trade may direct the company to submit a schedule of service such as will bring the actual hours of labor within reasonable limits, regard being had for all the circumstances of the traffic and the nature of the work.

THE GERMAN EMPIRE

With regard to the conditions of employment on railways the German Empire has from time to time promulgated special decrees and ordinances. The following regulations fixing the minimum requirements for applicants for positions in the State railway service were promulgated by the imperial chancellor, March 8, 1906:

Employees entering service for the first time must be not less than twenty-one nor more than forty years of age. Males more than forty years old who are partially incapacitated may be employed as watchmen, porters, platform attendants, and gatekeepers; and females more than forty years of age may serve as gatekeepers and station attendants. Technically skilled machinists may act as locomotive firemen before completing their twenty-first year. Other exceptions are allowable only on action by the local authorities.

The general requirements for employment include physical capacity, good hearing and sight, ability to distinguish colors, and satisfactory character. Officials must be able to read German and Roman print and script, to write legibly in German, and, where necessary in their employment, to compute in the four elementary operations. Detailed provision is made in the case of each class of employees, as watchmen, porters, brakemen, engineers, etc., giving the specific requirements as to knowledge of particular duties and of the appliances with which each must work; and for the higher classes of employment, the length of preliminary employment in the lower grades, and the periods of training and of probationary service that must precede permanent appointments. The restrictions as to probationary employment and age limits do not apply in the case of those officials and employees who are connected with the military branch of the railway service.

On the State railways of Prussia and Hesse, as prescribed by a law of April 1, 1902, the personnel is classed either as officials of the State or as employees for wages. Nominations are, in general, for a probationary period, followed by a revocable contract, and subsequently, in proper cases, by a permanent appointment. Until permanent appointment, unless in exceptional cases, all engagements are made under conditions of monthly wage payments.

Applicants for positions definitely provided for in the budgets must meet the required conditions, especially those as to prescribed examinations. Ticket stampers and other station employees, locomotive and train employees, switchmen, watchmen, road employees, and the like are not enumerated in the budgets, and are employed under revocable contracts. Agents of the lower and middle grades employed in budget positions may take permanent appointments after they have served satisfactorily for at least five years.

A law of July 14, 1888, contains the provision that employees on Prussian State railways must have no affiliation with societies opposed to law and order.

A decree of the Prussian Minister of Public Works issued Dec. 17, 1894, and subsequently amended in various points, forbids workmen employed in the State railway service to engage in their leisure time in work in the private interests of railway officials, and especially of those to whom are entrusted the employment and discharge of workmen or the inspection and management of the service. Written permission is required for specific persons and occasions, if exceptions are at all allowed.

Provisions as to the termination of the labor contract of railway employees in Prussia were made in the law of July 14, 1888, which provide that such contract may, in the absence of special agreements to the contrary, be terminated by either party without notice within the first four weeks of

service, and after this time, but without preventing an earlier release in cases of mutual agreement, on notice by either party given fourteen days in advance. If any other than the prescribed term of notice is agreed upon, it must be the same for both parties.

Dismissal without this notice of fourteen days may take place when an employee has used deception in the matter of the labor contract; if he is guilty of theft, embezzlement, immorality, etc.; if he leaves work without authority, or persistently neglects his duty; if he is careless with lights or fire in the face of warnings; if he is guilty of violence or gross acts of injury to his superiors, their deputies, or members of their families, or of deliberate and illegal acts which cause injury to the management or to his fellow workmen. Such discharge is not allowable after the facts have been known to a superior for more than one week. Before the discharge takes effect the employee is to have opportunity to make a statement and to establish the facts in the case at a hearing. Witnesses may be brought in where needful, and proofs may be submitted in writing.

A workman may leave the service without notice if he becomes unable to work; if his wages are not paid when due, or if his superior defrauds him; if the work exposes life or health to discovered dangers not known at the time of entering into the contract; if his superiors or members of their families are guilty of acts or attempts of an illegal or immoral nature against him or his family, or if they or their deputies commit acts of violence or gross injury to him or members of his family. For the last-named cause action must be taken within one week after the facts come to the employee's knowledge, in order to justify withdrawal without notice.

Damages for unwarranted discharge without notice may be allowed only in so far as actual injury results, and only to the amount of the consequent loss in wages for the period of notice. This will not be allowed where other employment was immediately secured.

With regard to the hours of labor on railways in Germany, a law of the Confederated States, enacted in 1899, prescribes for locomotive employees (engineers and firemen) a workday of not more than ten hours' length on a monthly average.

If the service is light, however, as on secondary roads, it may be 11 hours long. No single day of work may exceed 16 hours in length. In case of such length, service must be broken by rest periods and followed by a prolonged rest, to be passed at home and to be at night if possible. The time of route service may in no case exceed 10 hours, including stops at stations where employees cannot leave their posts, and including also the time for taking up and turning over their work and for coming from their homes and returning. If the work is continuous or exhausting, the average day is reduced to 8 hours and the maximum to 10.

The provisions as to train employees are practically identical with the above, except that the average workday is given a length of 11 hours.

Where station service is exacting and continuous, 8 hours constitute the average day's work, with a maximum of 10 hours. In other cases the average may be 12 hours, with a maximum of 14; or, if the service is light and broken by long rests, it may be extended by way of exception to as long as 16 hours. Gatekeepers and guards at minor stopping places may be employed for not more than 14 hours daily, unless where the service is light, when the day may be fixed at 16 hours. If gatekeepers can reside only at a distance from their posts, the time required to go to and from work is included in the work-time.

The rest periods include only the time when employees are exempt from duty and from preparation therefor, and must continue without interruption, in order to be counted as such within the meaning of the law, for at least 8 hours in the case of station employees and gatekeepers, and for 8 hours for train and locomotive employees, if the time is spent at home, or 6 hours if away from home. For these latter classes, however, the 6- or 8-hour period will be counted as rest only when falling between periods of service which are preceded or followed by a rest of at least 10 hours' length at home. Shorter periods than those designated above are to be included in the account of the time spent in service.

Every active employee in regular service is entitled to two holidays per month; or, if service is light, to one holiday. These days must be not less than 24 hours in length.

Night-work may be engaged in for not more than 7 nights consecutively.

In Prussia it is provided that employees whose duties require labor on Sundays and feast-days must be given opportunity to attend worship every second, or at most every third, Sunday. If the semimonthly holidays prescribed by the general law cannot be so arranged as to suffice for such attendance, other time is to be allowed therefor without being counted as absence from service or as rest-time.

Employ- ment

As regards the wages to be paid railway employees, a Prussian regulation of July 14, 1888, lays down the general rule that wages of State railway employees will be paid for only the time actually worked. In cases of temporary cessation from work, however, without fault of the employee, he may, if married or having a dependent family, receive two thirds pay for not more than fourteen days, after the manner of a military furlough, provided he has been in the service for at least one year. Workmen absent on account of the performance of military or civic duties receive wages for the period of necessary absence. In cases where personal concerns cause absence the allowance of wages rests with the management. Time lost without excuse may be adjusted for by deductions from pay, the management retaining the control of such matters entirely in their own hands, as well as that of adjustments for overtime work. Workmen regularly entrusted with the duties of subordinate officials receive pay for lost rest-days. Pay for the allowed rest periods and for the time granted for attendance at church is also given to such employees as are regularly employed in duties requiring them to work on Sundays and feast-days.

Wage Payments

Railway employees in Germany do not have the right of making agreements or combinations among themselves for the purpose of procuring better wages or conditions of work, as are enjoyed by other classes of workmen by virtue of section 152 of the imperial industrial code. Section 182 of the Prussian industrial code prohibits railway employees from making agreements for the purpose of stopping or delaying work.

FRANCE

In France the employment of engineers and firemen is restricted by a decree of March 1, 1901, to such persons as have procured certificates of capacity in a form determined by the minister of public works.

The hours of labor and rest of engineers, firemen, and employees engaged in train service were fixed by decrees bearing date of Nov. 4, 1899, amended May 20, 1902, and May 9, 1906. An order applying to station employees was issued on Nov. 23, 1899, while the hours of labor of those engaged in the supervision and maintenance of way are regulated by an order of Oct. 10, 1901. All the above were issued by the minister of public works and are applicable to the railroads controlled by the State and by the companies operating the principal systems of the country. The enforcement of the regulations as to the hours of labor of engineers, firemen, and train and station employees on State railways is entrusted, by an order of Feb. 13, 1901, to "committees of labor," made up of the heads of the various departments concerned and of representative employees.

From 1883 to the dates named above the hours of labor of engineers, firemen, conductors, and brakemen had been fixed at not more than 12 hours daily, including the time of their obligatory presence at duty points before and after actual employment, while the hours of labor of switchmen had been fixed at 12 per day as early as 1864.

According to the later provisions the hours of labor of engineers and firemen must not exceed an average of 10 per day in actual employment. On no day may they exceed 12, nor may the total on 9 consecutive days, counting from midnight to midnight, exceed 90 hours of actual work. This period must also include principal rest periods to an amount of 30 hours. Each period of labor is to be preceded and followed by principal rest periods, which may be separated from each other by intervals of not more than 17 hours.

Principal rest periods are only those that have an unbroken duration of at least 10 hours if passed at the home of the employee or of not less than 7 hours if away from home. The reduction of two consecutive rest periods to less than 10 hours each is forbidden and the sum of two consecutive periods must amount to at least 17 hours. A rest of not less than 30 hours' length is to be allowed all engineers and fire-

men engaged in road service once in 10 days, on an average. Where the engineer or fireman is not required to sleep away from home at any time the 30-hour rest periods may be reduced in number to one per fortnight. Such rests are to be reckoned at their length, less 20 hours, in making up the 9-day average mentioned above. Employees will be regarded as not having to sleep away from home only in case their daily duties allow them an unbroken rest of 10 consecutive hours at home between 6 P.M. and 12 M.

For locomotive employees in yard service, a rest of at least 30 hours is to be allowed every 15 days on an average; out of 24 hours every 10 hours and the principal rest period be reduced to 9 hours. Only such employment is regarded as not requiring employees to sleep away from home as permits unbroken rest at home of at least 9 hours, between 6 P.M. and 12 M.

Rest periods must be at least 9 hours in length if spent at home, and 7 hours if away from home. No two consecutive rest periods may be of less than 9 hours' length, nor make a total of less than 16 hours. A holiday of at least 24 hours is to be granted every 15 days on an average, and not more than 30 days may elapse between two such holidays. These holidays are to be reckoned at their actual length, less 14 hours, in making up the 14-day average.

The schedule time of through freight and passenger trains is to be diminished by 10 per cent in making up the total of the working-time. In other respects the regulations are the same for the trainmen as for locomotive employees, except that in the case of trainmen no mention is made of reserve periods spent at home.

Depot and station employees may be required to work 12 hours per day with periods of unbroken rest of at least 9 hours' duration, tho these may be reduced to 8 hours where the employee is lodged on the premises.

Employees

Shorter rest periods are to be allowed for the taking of meals near the middle and toward the close of the day. One holiday or a half-holiday per month must be allowed employees of this class. The holidays for 2 months may be allowed to accumulate, but not more than 2 months may pass without a holiday. Such a day includes the entire interval between 2 consecutive nights of rest. A half-holiday begins or ends at the middle of a customary day of labor, and must be immediately preceded or followed by a night of rest. These days and half-days are entirely at the disposal of the employees, and may be spent away from home if they so desire.

At stations having both night and day service night service shall not be required of any employee for more than 14 consecutive nights. When the change is made from day or night service to the other shift, an unbroken rest period of at least 24 hours must be allowed. Employees enjoying this privilege are not granted the monthly holidays or half-holidays mentioned above. Where night service is especially heavy, the minister of public works may require the alternation of shifts after 7 nights of duty, or such other number up to 14, as he may approve. Employees at small stations and stopping-places requiring the attendance of but a single person and at which there are not more than three trains daily in each direction may be required to serve for more than 12 hours, but their principal rest periods may not be reduced below 8 hours.

Watchmen, signal- and gatekeepers, and employees charged with the inspection and maintenance of ways may be required to work not more than 12 hours per day, with an unbroken rest of at least 9 hours, or of 8 hours where they lodge on the premises. Ten hours is the minimum, however, for employees where a female gatekeeper is employed, and the male employee is required to rise at night at the call of the public. A rest of about one hour for meals is to be allowed in the middle of the day; and if the work period exceeds 11 hours in length, there must be an additional interval of rest, about one half hour in length, either in the morning or afternoon. Suitable warmed shelters must be furnished at posts of duty where employees may eat.

At points requiring night as well as day service, where males alone are employed, the same provisions are applicable to consecutive night employment and rest periods at change of shifts as in the case of station employees. The positions of permanent attendants at gates and semaphores may be filled by females for the day service and by males at night without alternation. Such employees are entitled to an uninterrupted holiday of 36 hours' length each month. Where the employees concerned are husband and wife, they may, if they desire, enjoy the holiday simultaneously for the term of 24 hours.

With regard to railway employees abandoning their employment the railway law of France, dated July 15, 1845, directs that engineers or brakemen who abandon their posts during a run shall be punished by imprisonment, the term not to be less than six months nor more than two years in length.

RAILWAYS AND RAILWAY PROBLEMS: We consider this subject under the following heads: (I.) The United States; (II.) Foreign Countries; (III.) Railway Problems; (IV.) Remedies Proposed.

I. The United States

A. HISTORY

On July 4, 1828, Charles Carroll, last surviving signer of the Declaration of Independence, laid the first rail of the Baltimore & Ohio Railroad; the first railroad of this country to assume a comprehensive scale. Mr. Carroll said he considered the event "second only to that of signing the Declaration of Independence, if even second to that." The first tram-road in America was the Quincy road (1827) for hauling stone for the Bunker Hill monument. The first locomotive in America was imported from England in 1829, for use on the Carbondale & Honesdale Railroad, built by the Delaware & Hudson Canal Company. On the Baltimore & Ohio Railroad, chartered in 1827 and opened 1830, steam was not definitely chosen for the motive power till 1831, horse-power, and even sails, having been tried first. The West Point foundry works built the first American locomotive in 1830, for use on the South Carolina Railroad then being constructed. The panic of 1837 temporarily checked railroad building,

Beginnings but the whole line of the Boston & Albany was complete by 1842, the first road operated as a through route. New York and Philadelphia were connected by rail in 1840; New York and Boston in 1849; New York and Lake Erie, by the Erie road, in 1851; New York and Albany the same year; New York and Chicago in 1853. The first line to reach the Mississippi was the Chicago & Rock Island in 1854.

The rapid growth of the roads in the United States will be best appreciated by giving the figures. In 1828 there were 3 miles of railroad in the country; in 1830, 41 miles; in 1840, 2,800 miles; in 1850, 9,000 miles; in 1860, 9,800 miles; in 1870, 50,000 miles; in 1880, 82,000 miles; in 1890, 163,420 miles; in 1905, 218,101 miles.

The first roads were very moderately successful. Legislatures were suspicious of them. The Illinois Central received the first land grant in 1851, tho, after that, land grants were given freely. (See PUBLIC DOMAIN.) The first charters were very cautious, and there were no general bills for condemning property to give railroads the right of way, but in 1850 the New York Legislature granted railroad corporations the right to run their lines wherever they saw fit, subject only to certain conditions in the cities. This was a complete surrender on the part of the state of every attempt to supervise, regulate, and control the operations of railroad corporations, but it seemed productive of such immediate benefits that state after state followed the example.

No evil results of this lack of state supervision were apparent until 1857, when a financial crisis brought bankruptcy to many of the roads. To prevent the insolvent roads being closed to satisfy the bondholders or first mortgagees, the lawyers for the second mortgagees and the stockholders devised a plan of "reorganization." Under this policy of reorganization the first mortgage holders were given bonds representing a first lien on the roads and bonds representing accrued interest. The junior mortgagees were recognized by pre-

ferred stock, and the former stockholders, after paying something to defray the expenses of the readjustment, were given common stock to represent their former interest in the roads. This accumulated debt was called "increased capital," but in latter-day parlance has developed stock-watering. (See WATERED STOCK.)

The crisis of 1857 put an effective stop to railroad and land grants, and this was followed by the Civil War. The war, however, gave land grants a wider scope. A railroad to California was a political necessity. (See PACIFIC RAILROADS.) The first effective bill for the Union Pacific was passed in 1864, and the last rail laid in 1869. It led to railroad favoritism, upon the part of government, in colossal proportions.

From 1835 to June 30, 1892, railroad corporations received from Congress, directly and through the states, grants of land aggregating 56,483,804 acres, or an average of 9,600 acres for every mile of road constructed under the terms of the granting acts. In addition to these gifts of land the roads received subsidies of money from Congress, the states, counties, townships, cities, and villages. The five Pacific railroads (the Northern Pacific, the Union Pacific, the Atlantic & Pacific, the Southern Pacific, and the Texas Pacific) alone received subsidies of U. S. bonds amounting to \$64,623,512, and the interest paid on the same by the U. S. Government amounted up to June 30, 1891, to \$90,241,379.22. (See article PUBLIC DOMAIN.)

According to *Poor's Manual* for 1884, the average cost per mile of the railroads in the U. S. did not exceed \$30,000. The early railroads were purely local, chartered and built by local communities. The New York Central was consolidated from eleven different railroads in 1853. Vanderbilt, till then one of the foremost steamboat owners in the world, did not go into railroads to any extent till 1864. Mr. Scott entered the service of the Pennsylvania Railroad in 1850. As a result of his management the Pennsylvania Railroad owns to-day thousands of miles of the most valuable railway property in the U. S. Next to these great systems were developed the Grand Trunk in the north, the Erie in the middle, and the Baltimore & Ohio in the south, they being hindered respectively by disadvantage of situation, by speculation, and by the Civil War.

The next development of combination was the development of sleeping-car companies, express companies, and freight transportation companies, which ran through cars over many roads.

The first railroad pools were probably developed in a small way in New England. The first to have important public history was the Chicago-Omaha pool, in 1870, between three roads. The first great inter-railway association was the Southern Railway & Steamship Association, begun under the lead of Albert Pink, in 1873. The first great railway war began in 1869, when rates from Chicago to New York fell to twenty-five cents per hundred pounds. The first trunk-line pool on West-bound traffic was formed in 1877, and on East-bound in 1879.

Railroad legislation was all in favor of railroads. The only fear was that roads would not be built fast enough. Railroads were variously taxed, and liabilities only slightly enforced. The first popular feeling of any force against railroads was the Granger movement (1870-77). Nowhere

had railroad subsidies been more recklessly voted than in the upper Mississippi valley. Between 1865 and 1871 \$500,000,000 had been invested in Western railways. The price of wheat began to fall. With transportation charges at former figures, the farmers could not pay their debts; with charges reduced, the roads could not pay theirs. Roads under competition cut down

Granger Movement

rates to nearly nothing between competing points, and, where there was no competition, charged what they would. The feeling among the farmers ran high. The first tangible results were reached in Illinois. The constitutional convention of 1870 made an important declaration concerning state control of rates, on the basis of which a law was passed in 1871 establishing a system of maxima. Judge Laurence pronounced the bill unconstitutional. At the next election he was defeated. The law of 1873 avoided the issues raised by Judge Laurence. Similar laws were immediately passed by Iowa and Minnesota, and a much more stringent law, the so-called Potter law, which the railroads favored because so stringent, hoping thus to kill it. The roads appealed to the courts, but were defeated. Finally in 1877 the Supreme Court of the U. S. sustained the constitutionality of the Granger laws. But the laws defeated themselves. Railroad construction came to a standstill. In Wisconsin some existing roads could not be kept up. The men who passed the Potter law in 1874 hurriedly repealed it after two years' trial. Since then, however, the hostility to railroads has grown more general.

The Hepburn committee was appointed in New York "to investigate alleged abuses in railroad management," the hearings before which form the most important evidence in the railway question. In 1877 the strikes called universal attention to the subject. Railway commissions were everywhere established, that of Massachusetts—perhaps the most successful—as early as 1869. The commission of Iowa, perhaps the next most successful, dates from 1878. California gave its commission almost unlimited power. As a result the railroads found it necessary to get control of the commission.

In 1885 the U. S. Senate appointed a committee to investigate railroad abuses. As a result of that report Congress enacted

Railway Commissions

a law which went into effect in April, 1887, and the Interstate Commerce Commission has been a public institution ever since. During the debates on that bill the railroad lobby was energetic and active. The intent of the framer of the bill was that the law should give control of the railroads to the commission to be appointed; but the combined railroad interests of the country went to work to change the bill, and it received the signature of the president in such a form as to be almost worthless.

The courts decided that the law did not give the commission power to fix rates, and the procedure and penalties of the act proved to be comparatively ineffective in relation to the worst railroad abuses. Multitudinous discriminations of the most grievous sort continued year after year. The commission recognized and clearly stated the inadequacy of the law and asked Congress for amendments to make the law effective. But Congress did nothing until 1903, when the Elkins Bill was passed for the purpose of abolishing re-

bates and other forms of favoritism and discrimination. This also proved to be insufficient, and in 1906, as the result of two vigorous messages from President Roosevelt and strenuous efforts on his part, Congress passed the Hepburn Rate Bill, which greatly increases the powers of the commission, and will, it is hoped, enable it to put an effective check on the worst forms of discrimination and abuses of the rate-making power.

The bill provides that when the commission, upon complaint and hearing, has adjudged a rate fix by a common carrier to be unjust or unreasonable, or unjustly discriminatory, or unduly preferential or prejudicial, it may determine and prescribe what will be the just and reasonable rate in such case, which shall thereafter be the maximum rate, and may order the carrier to desist from charging the unjust rate. This order is to take effect within a reasonable time, not less than thirty days, and to continue for a period not exceeding two years, unless modified by the commission or set aside by the courts. Appeals must be taken within thirty days and have precedence. The commission may also prescribe what regulation or practice in respect to such transportation is fair and reasonable and require it to be thereafter followed. Enforcement of the orders of the commission may be had by injunction or other mandatory order.

Rate Bill

It is provided that any company or officer who knowingly fails or neglects to obey any such order of the commission is liable to a penalty of \$5,000 for each offense, and in case of a continued violation, each day is to be deemed a separate offense.

Rebates and discriminations of all kinds are again prohibited; every person or corporation, whether common carrier or shipper, agent or trustee, guilty of giving, receiving, or soliciting discriminations or rebates may be fined from \$1,000 to \$20,000 and imprisoned for not more than two years; shippers found guilty may be fined three times the amount of the rebates and three times the value of any other consideration received.

The commission may, at its discretion, prescribe the forms of all accounts, reports, and memoranda to be kept by the railways, and provision is made for the inspection of these by the commission at any time. It is unlawful for a carrier or its officers or agents to keep any other records, accounts, or memoranda except those prescribed by the commission, and penalties are provided for false entries in railway bookkeeping.

No change is to be made by the railways in any rate except after thirty days' notice to the commission, unless the commission, for good cause shown, allows changes upon shorter notice.

The express companies and sleeping-car lines are made common carriers; the private-car lines are included in the term "transportation" and brought within the jurisdiction of the commission. After May 1, 1908, no railroad shall engage in the transportation of commodities of its own in competition with shippers over its lines. This is intended to prevent the mining of coal, the production of coke, etc.—the railroad control of the coal-mining industry.

The law contains a qualified prohibition of free passes. It says that "no common carrier subject to the provisions of this act shall, directly or indirectly, issue or give any interstate free ticket, free pass, or free transportation for passengers, except to its employees and their families, its officers, agents, surgeons," etc.

It increases the number of Interstate Commerce Commissioners to seven, their term of office to be seven years and their salaries to be \$10,000 per annum, and permits four of them to be of one political party.

While there are some good features in the law, it certainly does not amount to much as a rate-regulative measure. It gives the commission the formal power to fix the maximum rate, but it gives the railroads the power to take the commission's orders into court and obstruct and largely nullify the commission's efforts to secure just and equal treatment. Even if the bill had passed in its original form, it would have been quite inadequate, as the power to fix and enforce a maximum rate is not the power to secure equal rates. The commission has no authority to revise rates on its own motion nor to control classification by which railroads can readily change rates. No provision is made for the valuation of railroad property, which is essential to the fixing of fair rates. Nothing is done about the basing-point system. No adequate provision is made to meet

the trick of withholding testimony and concealing facts.

The coal roads are reported to have already projected a billion-dollar corporation for the purpose of merging and holding the anthracite properties and so circumventing the law.

The law does not touch overcapitalization, nor stock-gambling, nor the political relations of the railroads, but rather tends to intensify their political relations.

B. STATISTICS FOR THE UNITED STATES

The following data are from the reports of the Interstate Commerce Commission for the years ending June 30, 1905, and June 30, 1906:

The total single-track mileage of railways in the U. S. June 30, 1905, was 218,101 miles, or 4,196 miles more than at the end of the previous year. The preliminary report for the year ending June 30, 1906, includes the returns from 852 railway companies, representing an operated mileage of 220,028 miles, "or approximately 90 per cent of the mileage that will be covered by the complete report for the year," indicating therefore a total mileage of about 222,000 miles.

On June 30, 1905, there were in the service of the carriers 48,357 locomotives. These locomotives, excepting 947, were classified as: Passenger, 11,618; freight, 27,869; and switching, 7,923.

The total number of cars of all classes was 1,842,871, or 44,310 more than for the year 1904. This rolling stock was thus assigned: Passenger service, 40,713 cars; freight service, 1,731,409 cars, and company service, 70,749 cars. These figures do not include cars owned by private commercial firms or corporations.

The number of locomotives and cars in the service of the railways aggregated 1,891,228, of which 1,641,395 were fitted with train brakes, or an increase for the year of 86,653, and 1,871,590 were fitted with automatic couplers, or an increase of 48,560.

Equipment

Nearly all the locomotives and cars in the passenger service had train brakes and all but 82 locomotives in the same service were fitted with automatic couplers. Only 1.63 per cent of cars in the passenger service were without automatic couplers. Substantially all the freight locomotives had train brakes and automatic couplers. Of 1,731,409 cars in the freight service on June 30, 1905, the number fitted with train brakes was 1,515,354 and with automatic couplers 1,715,854.

The reported number of persons on the pay rolls of the railways in the U. S. on June 30, 1905, was 1,382,196, which is equivalent to an average of 637 employees per 100 miles of line. These figures show an increase in the number of employees as compared with the year 1904 of 86,075, or 26 per 100 miles of line. Of the employees 54,817 were engineers, 57,892 firemen, 41,061 conductors, and 111,405 were other trainmen. There were 45,532 switch-tenders, crossing-tenders, and watchmen. Railway employees, disregarding a small number, were thus assigned among the four general divisions of railway employment: For general administration, 54,141; for maintenance of ways and structures, 448,370; for maintenance of equipment, 281,000; and for conducting transportation, 595,456.

The total amount of wages and salaries reported as paid to employees during the year ending June 30, 1905, was \$839,944,680.

On June 30, 1905, the par value of the amount of railway capital outstanding was \$13,805,258,121, which is equivalent to a capitalization of \$65,926 per mile for the railways in the U. S. Of this capital there existed as stock \$6,554,557,031, of which \$5,180,933,907 was common and \$1,373,623,144 preferred; the remaining part, \$7,250,701,090, represented funded debt.

Of the total capital stock outstanding, \$2,435,470,337, or 37.16 per cent, paid no dividends. The amount of dividends declared during the year was \$237,964,482, being equivalent to 5.78 per cent on dividend-paying stock.

Capitalisation

The total amount of funded debt (omitting equipment, trust obligations) that paid no interest was \$449,100,390, or 6.36 per cent.

Of the total amount of railway stock outstanding, \$2,070,052,108 were reported as owned by railway corporations, and of railway bonds, \$568,100,021 were so reported.

The number of passengers reported as carried by the railways in the year ending June 30, 1905, was 738,834,667, this item being 23,414,985 more than for the year ending June 30, 1904. The passenger mileage, or the number of passengers carried one mile, was 23,800,149,456, the increase being 1,876,935,900 passenger-miles.

The number of tons of freight reported as carried (including freight received from connections) was 1,427,731,905,

which exceeds the tonnage of the year 1904 by 117,832,740 tons. The ton mileage, or the number of tons carried one mile, was 186,463,109,510, the increase being 11,941,019,933 ton-miles. The number of tons carried one mile per mile of line was 861,396, indicating an increase in the density of freight traffic of 31,920 ton-miles per mile of line.

Public Service

The average revenue per passenger per mile for the year ending June 30, 1905, was 1.962 cents. For the preceding year the average was 2.006 cents. The average revenue per ton per mile was .766 cent; the like average for the year 1904 was .78 cent. The ratio of operating expenses to earnings for the year 1905 was 66.78 per cent. For 1904 this ratio was 67.79 per cent.

The gross earnings of the railways in the U. S. from the operation of 216,973.61 miles of line were, for the year ending June 30, 1905, \$2,082,482,406, being \$107,308,315 greater than for the year 1904, and for the first time exceeding the two-billion mark. Their operating expenses were \$1,390,602,152, or \$51,705,899 more than in 1904.

The preliminary report for 1906 shows that the gross earnings of the 852 roads above referred to were \$2,319,760,030. This amount included as earnings from passenger service \$618,555,934, or 26.66 per cent; from the freight service, \$1,640,942,862, or 70.74 per cent, and miscellaneous earnings, \$60,261,234, or 2.6 per cent. The gross earnings for 1906 averaged \$10,543 per mile. This average is much higher than the like average for any previous year since the organization of the commission. (This is the 10th annual report.)

Earnings and Expenses

The gross earnings of the railways, as shown in the final report for the year ending June 30, 1905, represented an average of \$9,598 on 216,973.61 miles of line operated. For 1906, as shown by the preliminary report, the operating expenses of the railways were \$1,532,103,153, or \$6,963 per mile. The ratio of operating expenses to earnings was 66.05 per cent. The same average in the final report for the year 1905 was 66.78 per cent. This advance report shows that the net earnings of the same roads for the year ending June 30, 1906, were \$787,596,877, or \$3,580 per mile, and for the year 1905, \$690,691,151.

The amount reported by the carriers as income from sources other than operation was \$132,624,982, which amount includes a few duplications due to the method of accounting followed by certain of the reporting carriers. The total net income of the operating roads covered by this report was \$920,221,859. Against this amount was charged for interest, rents, betterments, taxes, and miscellaneous items the sum of \$590,386,554, and as dividends the sum of \$220,406,598, leaving a surplus for the year of \$100,428,707. The taxes charged to income during the year were \$68,903,488. The final report for the year ending June 30, 1905, showed a surplus of \$89,043,490. The amount of dividends declared in 1906 was \$34,248,605 more than that shown for the dividends of practically the same roads in 1905. This preliminary report, as already stated, relates to operating roads only, and does not include the statement of any dividends by leased lines from the income they received as rent. The dividends declared by subsidiary leased lines for the year 1905 were about \$35,750,000.

The total number of casualties to persons on the railways for the year ending June 30, 1905, was 95,711, of which 9,703 represented the number of persons killed and 86,008 the number injured. Casualties occurred among three general classes of railway employees, as follows: Train-

Accidents

men, 1,090 killed and 29,853 injured; switch-tenders, crossing-tenders, and watchmen, 136 killed, 883 injured; other employees, 1,235 killed, 36,097 injured.

The number of passengers killed in the course of the year 1905 was 537 and the number injured 10,457. In the previous year 441 passengers were killed and 9,111 injured. The total number of persons other than employees and passengers killed was 5,805; injured, 8,718. The total number of casualties to persons other than employees from being struck by trains, locomotives, or cars was 4,569 killed and 4,163 injured. The ratios of casualties indicate that 1 employee in every 411 was killed and 1 employee in every 31 was injured. With regard to trainmen—that is, engineers, firemen, conductors, and other trainmen—it appears that 1 trainman was killed for every 133 employed and 1 was injured for every 9 employed.

In 1905 1 passenger was killed for every 1,375,856 carried, and 1 injured for every 70,655 carried. For 1904 the figures show that 1,622,267 passengers were carried for 1 killed, and 78,523 passengers were carried for 1 injured. For 1895 1 passenger was killed for every 2,984,832 carried, and 1 injured for every 213,651 carried.

II. Foreign Countries

A. GREAT BRITAIN

England is the birthplace of the iron horse. Steam transportation began about 1825. The profits of the early lines were so large that railway

stocks went to a premium of 100 per cent. And in consequence of this a mania for building railroads broke out in 1825, resulting in overconstruction, panic, and collapse.

No national plan of railway location was adopted. The English theory was private railways with competition and parliamentary regulation.

In 1844 a select committee, with Mr. Gladstone as its chairman and guiding spirit, went over the whole railway question and reported that rates were too high; that "competition between railway companies is likely to do more injury to them than good to the public"; that, on the other hand, monopoly in private hands was to be dreaded and guarded against, and that the government should reserve power to purchase the lines at reasonable cost after a given time. The next year the Gladstone bill known as the Cheap Trains Act was passed, providing: (1) for fares not exceeding two cents a mile at least on one train a day; (2) revision of the maximum rates; (3) certain powers for the Board of Trade in order to hold the railways to the law; and (4) the compulsory acquisition of the railways by the State, in the discretion of Parliament, at any time after twenty-one years from that date (1844) upon payment of "twenty-five times the annual divisible profits estimated on the average of the three then next preceding years."

Before the stated time arrived, however, railway earnings had grown so large, and railway influence had become so great, that the option of purchase was not exercised, tho the possible ultimate possession of the railways by the State has been kept steadily in view, every railway act since 1844 being made subject to the Gladstone law of that year and the option therein contained.

The English railway rates are on the whole far higher than on the Continent or in the U. S., the average ton-mile rate being estimated at two cents and a half and the average passenger rate at about two cents and one-quarter. Considering actual rates instead of averages, taking the charges for similar services over the same distances, Acworth says "the English rates are the highest in Europe, but are not so high on local traffic as the rates in the U. S."

The English freight rate includes collection and delivery, loading and unloading, and to a large extent insurance also. Moreover,

Rates

the traffic on the English roads is in small consignments and is carried and delivered with promptness, so that it is no wonder their ton-mile rate is higher than ours, especially when we remember that our average haul is very much greater, and that cut rates and secret rebates, bringing the receipts below the published tariff, do not exist in England to anything like the extent they are practised here. These things help to explain why the English ton-mile rate is more than three times the American average of .78 of a cent, which is largely due to our discriminations and enormous wholesale shipments of cheap goods for immense distances.

As compared with rates in Germany and Belgium, English rates are very high, and there has been for many years a constant agitation for reduction. In passenger rates some concessions have been made, but in freight rates on the whole no reduction has been made for over thirty-five years. The roads unite and agree upon railway rates and regulations, which are not departed from except on notice to the other roads. Some

managers say there has been no competition as to rates for forty or fifty years, with the exception of a rate war now and then of limited duration and extent, when some new line was opened. There is competition in service, but no competition in rates, and the effort to secure fair rates by legislation has not been successful.

The joint committee of 1872, one of the ablest committees that ever sat in England, reviewed the forty years' effort at legislative regulation of railroads, and concluded that aside from some moderate success in securing safety, English railroad legislation had never accomplished anything it had sought to bring about, nor prevented anything it had sought to hinder.

The cost of the practically useless mass of 3,300 enactments had amounted to nearly \$400,000,000—an enormous price to pay for the discovery that regulation did not regulate. In 1873 another law was passed establishing a railway commission with power to fix through rates, enjoin discriminations, and give damages to persons injured by railway violation of law. In 1881 a new committee investigated the workings of this act, and found that rates were still too high and discriminations still prevailed. In 1888 another law was enacted strengthening the power of State control and ordering a revision of the rates. Millions of railroad rates were put into the crucible of reduction. The inquiry lasted 130 days, and the official minutes occupied 3,926 pages, and in the end the railroads got the best of it, for in return for every rate that was reduced they succeeded in lifting the legal level of one and a half rates above the former tariff, and a little later advanced their rates so that their total charges were lifted considerably above the totals before the revision of 1888. In consequence of this another law was passed in 1894 giving the commission power, on proof of the unreasonableness of any increase since 1892, to order a return to former rates.

Complaints of extortion and discrimination still pour in upon the Board of Trade, which has only conciliatory powers, and upon the commission, which has power of injunction, fine, and imprisonment. The Board of Trade has received over 3,200 complaints since 1888, nearly all of them involving some element of discrimination either directly or indirectly. And the secretary of the Traders' Association asserts that numerous as are the complaints made to the Board of Trade, their association gets ten complaints to one that goes to the board. Shippers as a rule are afraid to fight the railways. And besides this the great bulk of discriminations are not known to any one whose interest it would be to make complaint.

The morals of English railways are by no means so lofty as their rates. The absence of conscience was noted very early in their history, and the condition has become chronic. The railways have always had great influence in Parliament. The landowners who owe so much to the railways and are so largely interested in them constitute a large portion of both Houses.

The railways still have a large number of their directors in Parliament and others who are large shareholders. They cannot, of course, control legislation completely, but have sufficient influence to keep Parliament from passing any drastic legislation, and to secure such modification or amendment of anti-railroad bills as may make them comparatively innocuous.

The British railway capitalization stands at \$326,000 a mile for England and Wales, and \$270,000 a mile for the whole United Kingdom, the highest national average in the world.

The secrecy of English accounts is such that less is known about the inside workings of the roads than in any other country. In many ways, except on the best through routes, the service is not up to the standard of the railways in our northern and western states, nor to the service on the German roads.

The principal lesson of English railway history is that powerful railroad interests left in private control cannot be satisfactorily regulated by law. No government in the world has tried harder to control a private railway system in the public interest. For over sixty years the English Parliament has striven to secure safety, to stamp out discrimination, prevent excessive charges, and control the exercise of railway power. The result is a degree of safety superior indeed to ours, but by no means equal to that attained by the State railways of Germany and Belgium; discriminations and excessive rates are still in abundant evidence, and a general dissatisfaction so great that Acworth, the classical English writer on railway subjects from the railway standpoint, corresponding to Professor Hadley in this country, told the writer a few months ago that "nine out of ten people in Great Britain would vote for public ownership of railways if the question were submitted to a vote to-morrow." This testimony is especially weighty from the fact that Acworth himself is not a believer in public ownership, but on the contrary is practically identified with the best corporation view of things in England.

Among the difficulties in legislative control of railways that are often overlooked are: (1) That, as Acworth says, "For every shilling cut by an expeditious tribunal off a rate it is easy for the railway companies to withdraw two shillings' worth of facilities. (2) For a merchant or farmer to undertake to fight trained railway experts with a lifetime's experience and with every fact and figure at their fingers' ends is only to court defeat. (3) Even when a decision goes against a road it is easy for it to retaliate by measures which no control can prevent unless it were prepared to take upon itself the entire responsibility of the detailed management of the line."

"We do not like to quarrel with a railway company," said a large manufacturer, "and this very fact goes far to nullify any legislation that may be advanced for the protection of the public against the companies."

B. BELGIUM

The railroad history of Belgium is in vivid contrast with that of England. The first railways were built by the State, beginning in 1833 and opening the first line in 1835. The government laid out the roads on the broad lines of a carefully considered national system of transportation on plans drawn up by George Stephenson, who was employed by the government as being the greatest railway engineer of the age. After the principal routes had been occupied by the State railways, concessions were granted to private companies for branch and connecting lines and later for lines that came naturally into competition with the government roads.

For twenty years, from 1850 to 1870, the

government pursued the policy of a State system in competition with private railways, the only kind of competition that does not lead to combination against the public. The companies consolidated into powerful systems and the competition between the public and private roads was very earnest. The government began the main battle in 1856 by making great reductions in rates. A system of special rates was introduced, with the result that both traffic and receipts increased in an astonishing ratio. In 1861 the reductions were extended, and a regular sliding scale of charges, decreasing according to distance, was put in force, being applied at first to the lowest and roughest class of goods. The result was an immediate increase of 72.4 per cent in the tonnage of the goods on which the reductions applied, and the entire traffic rose 11.6 per cent. The increase of traffic in the half year was equivalent to the average increase of three years preceding.

The next year the low sliding rates were extended to all goods of the third class and a reduced scale was put in operation for the second class. The increase of tonnage in the eighth year of the experiment was 106 per cent. This increase was practically on the same mileage, as only about thirty miles had been added to the State lines.

In 1870, after twenty years' experience with public and private roads, side by side, the government decided to take over the private lines. Large purchases were made in 1871-73, and by 1874 the government had one half the railways in the country; in 1880 it had two thirds; in 1885 it had three fourths; and in 1905 it had over seven eighths of all the railways, and the only remaining line of any great importance will be taken over as soon as the franchise expires.

The financial results were unsatisfactory at the start. For the first fifteen years there was a deficit. After that the roads began to make a profit, and by 1872 the profit on the State lines was 6 per cent on the total expenditure to date. In 1882 the profit on the State lines was 5.62 per cent, and 5 per cent on private lines. The profits now are 4½ per cent. The total expenditure on the roads operated by the State has been \$429,000,000, the receipts \$1,042,690,000, and the profits \$251,000,000.

The direct financial gains constitute the smallest part of the benefits the State railways have conferred upon the country. The government has always treated the question of earning a profit as entirely secondary to the development of industry, the promotion of prosperity, and the service of the public. The policy has been to use the surpluses for reducing rates, extending the lines, and increasing facilities. If the indirect financial benefits and contributions to the general prosperity due to the wise policy of the government roads could be calculated and added to the direct financial gains, it would be found that the State railways had returned to the people in money values many times their cost, to say nothing of the moral, political, social, and civilizing values of an honest, open, enlightened, public-spirited management of the public highways.

Discrimination between individuals is unknown. Complete publicity is secured under State ownership and secret rebates or other unfair practises are impossible. No serious trouble with the "patronage" or other political difficulties have been experienced. There have been complaints at

times about the lack of cars, the running of trains, etc., but "nothing which will compare with those constantly made both in Great Britain and in America."

President Hadley, of Yale University, who is opposed to government ownership, says: "In judging the railroad policy of Belgium by its results, all must unite in admitting that they are in many respects extraordinarily good. What their averages are, we have already seen. The passenger rates are lower than anywhere else in the world, except, perhaps, on some East Indian railroads. The freight rates are much lower than anywhere else in Europe. Nominally they are about the same as in the United States."

C. FRANCE

France did not adopt either the competitive theory of England or the State system of Belgium, but a sort of quasi-partnership between private companies owning and operating the roads, and the government contributing funds, guaranteeing dividends, exercising extensive supervision and control, providing for State participation in surplus profits, and reserving rights of purchase and revision on terms generally regarded as advantageous to the public.

The development of the French system was very slow. While England and Belgium, Germany and the United States were building railways, France was trying to overcome the inertia of private capital and reason out a proper plan of procedure in a long series of debates, 1833 to 1842, especially in the last six years of that period.

Nothing was settled till 1842, almost a decade after Belgium began to build her State lines. Then the government took the lead. A plan proposed by Thiers was adopted. A national railway system was to be built, the State undertaking the earthworks, masonry, and stations, and providing one third of the land. The departments (corresponding to our states) were bound to pay by instalments the other two thirds of the land cost, and the companies were to lay down the rails, maintain the permanent way, and find and work the rolling-stock. After forty years the whole was to revert to the State.

Nine great lines (seven radiating from Paris and two provincial) were laid out by first-class engineers on a carefully considered national plan, avoiding parallel lines and waste of capital. Public confidence was won. Roads were built, shares rose to 50 per cent premium, and by 1848 a total of 1,092 miles had been opened. The crisis of 1847-48 compelled the government to assume the operation of several of these roads in order to prevent the complete cessation of traffic.

Under Napoleon III. the railways were consolidated into six great systems, each with a distinct territory; their charters were prolonged to ninety-nine years from the date of the extension, and a complete system of government regulation and audit was provided. The amalgamation policy, extension of franchises, etc., stimulated railway building, and from 1851 to 1857 the railway mileage rose from 2,124 to 4,475 miles, or more than doubled. The building had been too rapid, and the panic of 1857, known as "the railway crisis of 1857," was the result. Construction practically ceased, and it did not revive even after the panic had passed. The companies had built the lines that gave promise of large profit. Each had a monopoly in its own district and did

not feel called upon to put out branch lines to develop outlying business, which must prove less profitable than the through traffic or the local business of the more populous routes their railways followed. This district monopoly is the main characteristic of the French railway system. England represents the theory of private competition and government regulation. The French idea is private monopoly and government regulation.

In 1883 new conventions with the big companies were made. The companies agreed to build 6,900 miles of new lines. The State agreed to pay for the new roads by annual instalments of about thirteen millions each for seventy-four years, or about the middle of the twentieth century, when the whole system reverts to the State. The distinction between old lines and new was given up; the State guaranteed each company a minimum dividend equal to the amount it had paid in preceding years; and the State's share in the profits was advanced from one half to two thirds of the amount available for dividends beyond certain high percentages fixed in the agreements. The minimum dividends guaranteed and the quasi-maxima beyond which the State comes in for a share are as follows:

| | Guaranteed minimum per cent | High line beyond which State shares excess |
|-----------------------------|-----------------------------|--|
| Northern Railroad..... | 13.5 | 22.1 |
| Mediterranean Railroad..... | 11. | 15. |
| Orleans Railroad..... | 11.1 | 14.4 |
| Southern Railroad..... | 10. | 12. |
| Western Railroad..... | 7.7 | 10. |
| Eastern Railroad..... | 7.1 | 10. |

At every step the railroads compelled the government to accord them some great advantage in return for the development of railway facilities required in the interest of the public. In 1842 they exacted a subsidy, in 1852 an extension of franchise, in 1859 a guaranty of interest on bonds, in 1883 a guaranty of dividends on stock.

Yet the companies are not happy, because the government keeps such a strict watch over them and insists on "prying into their private affairs." Every time-table and every tariff has to be approved by the minister of public works before it can go into effect. The government fixes maximum rates subject to the approval of the minister and the companies make whatever rates they please up to the maxima, which are very high—considerably above the actual rates the companies care to make in most cases. The minister must approve or reject a tariff as a whole. He has no initiative as to rates nor any detailed power of modification. He can recommend the changing of specified rates in any tariff proposed by a company, but cannot require the company to adopt his suggestions. If he refuses to accept a new tariff the old one continues in force.

The minister controls the location of new lines. He must approve all plans and may modify them at pleasure, and construction is not accepted till passed upon by the State engineers.

In no other country has so complete a system of public control and supervision of railways been developed, and yet the public is very much dissatisfied with the railways. No country, except

Italy, is so full of railway complaints and of agitation for State ownership.

The International Company, corresponding to our Pullman Company, pays the railways 1.6 cents a mile for hauling its sleepers. It is the other way round with us, for our railways pay the Pullman Company 2½ to 3 cents a mile for the privilege of hauling the sleepers.

Another curious fact is that the French railways not only carry the mails free, but haul the government postal cars for .6 of a cent a mile while charging the Sleeper Trust 1.6 cents a mile. With us the railways pay the Sleeper Trust 2½ or 3 cents a mile and charge the government in many cases as high as 5 to 7 cents a mile for hauling railway postal cars in addition to excessive charges on the mail itself.

The French rates are very high, and, except on the best through trains, the service is very poor, according to our standards. In spite of the monopoly each road possesses in its district, all the big companies have agreed on passenger rates. The average passenger-mile rate is 34 per cent higher than in Germany, altho the average haul in France is about 30 per cent longer, so that the rate ought to be lower instead of higher. Large numbers of working people in Germany, nearly half the low-rate travel, go on fares to which 60 per cent must be added to get the lowest French rate, that for third-class travel.

Freights are also higher in France. The average haul is 30 per cent greater in France than Germany, and yet the average rate per ton-mile is 10 per cent higher.

Opinions differ about the extent of discrimination. One railway manager says: "There is no such thing in France. The criminal law is very severe, and it would mean imprisonment. There were complaints of favoritism a dozen years ago, but there have been none in recent years." But very different ideas are expressed by representatives of shipping interests and others. Here are some of their statements: "The railroads hold manufacturers and merchants at their mercy. They favor the great, and put the burdens on the little fellows. The tariffs are full of special rates, and 80 or 85 per cent of these rates are made simply for some favored merchant or manufacturer. It is true that complaints are not made. The danger is great. Where is the merchant who dare undertake a campaign against the great companies?" The statement of M. Cawes (vol. iv., p. 136, of the "Cours d'Économie Politique") is said to be still true: "The benefit of reduced tariffs is accorded upon secret approaches and solicitations; the companies dispen- at their will industrial prosperity and ruin."

The history of the State lines in France illustrates the excellent results that government management has achieved with roads wholly unsuccessful in private hands. The French Government undertook an exceedingly difficult task when it nationalized the Southern lines. The

Results

roads were bankrupt. They were badly located, in a poor region left by the Orleans and the Western roads because regarded as undesirable. For a long time the State system did not have any line to Paris. The State system lacks the big interests, the mines, the wine trade, etc., that so materially aid the income of the companies. And it has no great artery, national or interurban, between great cities. Yet, with all these difficulties,

the State lines have made a wonderfully good record. Both freight and passenger rates are considerably lower on the State lines than on the private roads for similar distances and traffic. Even the average rates per ton-mile and passenger-mile have been lower than the company average nearly all the time since the government took the roads. The State adopted from the start the policy of reducing rates as fast as possible, while the companies for many years maintained their rates substantially unchanged. In the first dozen years the government reduced freight rates 25 per cent and passenger rates 36 per cent, and the same policy has been continued to the present time. Yet the State has made a good profit because the business has developed greatly with the lowering of rates. The receipts per mile on the State lines rose 40 per cent in the first ten years, while the company's receipts per mile remained practically stationary. From 1884 to 1900 the receipts per mile rose 49 per cent on the State system and less than 8 per cent on the company lines, while the net earnings rose 139 per cent for the State road and only 10 per cent for the companies. (*Journal Official*, Ch. Annexes, Session Extraordinaire, p. 1125.)

The State put in more comfortable cars, was the first to heat cars of the third class, and the first to use steam from the locomotive for this purpose. This method was still an experiment in France in 1902, tho it had already been successfully used in Germany for a long time. The State roads are more democratic than most of the companies, carrying all classes on its express trains and giving third-class passengers better accommodations in every way. Care and safety are greater also on the government roads, as statistics abundantly prove. If brilliant and massive results are desired, the State system must be enlarged. But in the difficult sphere to which it has been confined, hedged about with limitations by nature and convention, it has done all and more than could have been expected of it, with its enlightened rate policy, its progressive initiative, its amelioration of the conditions of labor, and its fine record as to safety.

It is beyond question that the sentiment in favor of State operation is growing in France; that it is now regarded by many as the principal question before the country; and that action is probable at no very distant date if a way can be found that does not involve too much financial risk.

D. GERMANY

The first railways in Germany were private. In Prussia, whose history is of the most importance to us, railway building was left to private enterprise till 1848, the government assisting in some cases by investing in stock or guaranteeing a minimum of interest on the stock.

The period 1848 to 1862 was characterized by the building of State roads. Then came an era of speculation, 1863-77, during which many private roads were constructed. In 1878-79, after long experience with both public and private railways, a definite and final decision was reached in favor of State roads, and from that time on, by purchase and construction, the government has added to its railway system till now it has about nineteen twentieths of the total mileage, and it is only a question of time when it will have the other twentieth. In every one of the twenty-six states of the German nation the railways are

either wholly, or almost wholly, in the hands of the government—30,520 miles out of a total of 33,070 being public roads and only 2,456 miles operated by private companies.

Commercial interests favored public operation of railways. In 1872, four years before Bismarck formed his national railway policy, the German Handelsstag, representing the united chambers of commerce, petitioned for government management of all the railways to secure greater unity and efficiency and to stop the abuses of the private railways.

As in America so in Germany, overconstruction of railways on speculative ventures was a main cause of the crisis of 1873. It was substantially a railroad panic. The same

History year Lasker, a member of the Prussian Parliament, made serious charges in relation to the private railways.

An investigation was ordered. The commission held fifty-six sittings, and the evidence and conclusions fill a thousand big quarto pages. The moral rottenness of the private railroads was fully exposed—the political pressure they used to get their franchises; the conscienceless discriminations they practised between persons and places; the arbitrary use of industrial power to build up one and tear down another; the absence of any effort to make rates either absolutely or relatively reasonable, except so far as public control may intervene; the abuse of power for private purposes; the utter disregard of the public interest wherever it conflicted with the private interest of the railways—all these tendencies or laws of action were revealed and masses of facts in relation to them brought to light. The commission reported in favor of an exclusive system of State railways, saying that it could not be realized at once, but "on economic considerations" and other grounds "such a system is the final goal to be striven for."

In 1874 Albert von Maybach became the head of the Government Railway Department. He was a man of great energy and resource, and thoroughly convinced that the unification and socialization of the railways was industrially and politically wise. He and Bismarck, the chambers of commerce, and other business interests worked together for this end. Political and commercial forces joined in the movement. The railway question in the seventies was the principal question in Germany, as it was till 1906 in Italy, and for a number of years preceding the referendum of 1898 in Switzerland, and is to-day in France and America.

State ownership was advocated mainly on economic and political grounds, military considerations being advanced also, but with nothing like the stress laid on the economic arguments.

It was urged that the railways should be managed solely in the public interest, and as a unit; that railways are frequently needed where they will not pay and where private enterprise will not build them; that, on the other hand, private enterprise wastes capital and labor, building unnecessary roads and running unnecessary trains; that the irregularity of private railway construction causes serious injury to industry, helping to bring on industrial and financial disturbance and ceasing just when its continuance is most needed for industrial relief; that the government alone can draw up a consistent plan of railway building, to extend through many years and to be executed gradually with due regard to the public

well-being, and find it even more profitable to push construction in times of depression.

The opposition was powerful. Objections were vigorously urged—substantially the same objections that are made in America to-day—that so great an extension of government employment would be dangerous; that political abuses would result; that sectional strife would paralyze the railroad system; that in the absence of competition the State roads would become non-progressive and inefficient; that private initiative and individual liberty were essential (meaning private initiative for private profit as distinguished from private initiative in public service), etc., etc.

In his great speeches in the Prussian Parliament Bismarck bore down all objections by appealing to experience with State railways in Prussia and other German states (some of which owned practically all their railways), and emphasizing the fact that State railways "served the public interest," and, "as a secondary consideration, aid the public treasury," while "it is the misfortune of private railways" that public highways and public functions "are exploited in behalf of private interests and private pockets."

The argument for State ownership submitted to the Prussian Parliament in 1879 by the cabinet, along with bills granting the power and means necessary for the purchase of four important railway systems and the extension of the State lines, is one of the most important railroad documents in the world.

Parliament gave the administration authority to purchase the principal private railways, passing the bill by a vote of 226 to 155, and the roads were bought. The government had

State Roads a right to take the roads at twenty-five times the average net earnings for the preceding five years, but it preferred to come to an agreement satisfactory to the owners rather than to take the railways by compulsory process. Before negotiations were entered into with the companies, however, they were given to understand that it was for their own interest not to make exorbitant demands, as in that case the government would apply to them some of that competition they so much admired.

The companies got full value plus, and the State made an excellent bargain; for the economies effected under State management "enabled the government to make a net profit of 1 per cent on the purchase" above the interest paid on the consols exchanged for the stock and on the 4½ per cent bonds of the companies which were transferred to the government.

Some of the principal results of public ownership and operation are as follows:

1. The abuses so much complained of under the private system do not exist in Germany. Unjust discrimination has ceased. There is absolutely no favoritism in the German railroads. Shippers are treated with perfect impartiality.

There are no free passes except for employees on railway business. Even the minister pays his fare, and the emperor, too. There are no secret rebates or open concessions, by commissions, elevator allowances, or mileage graft in private cars, no midnight tariffs, terminal railroad abuses, or expense-bill tricks, no underbilling frauds or classification favors, no fostering of trusts and monopolies, no long- and short-haul injustices, no basing-point system, no watered securities or

gambling in railway stocks, no railway wars, no wasteful construction of competitive railways, no refusal to construct needed lines in rural districts, no disregard of safety nor postponement of public interest to private profit in any way, no excessive transportation charges on the postal service, no railroad rulers levying their private taxes on the commerce of the country, no railway nullification, evasion, or defiance of law, no railroad lobbyists either inside or outside of legislative bodies at the national capital or the state capitals seeking to corrupt or pervert legislation, no railway battles in the courts, no railroad senators.

2. Political influence does not enter into the administration nor into the employment of the men. The spoils system is unknown in Germany. No member of Parliament can get a friend or constituent work on the State railways through political influence. The man must be thoroughly fit and must prove his fitness by undergoing the civil-service tests, like any other candidate for employment. Even the minister cannot override the civil-service rules, nor can the emperor himself disturb the impartiality and efficiency of railway organization by the infusion of political influence into appointments.

President Hadley says that political difficulties have not been experienced in the administration of the Prussian railways, which he thinks "is chiefly due to the superb organization of the Prussian civil service." Prof. B. H. Meyer, one of the highest railroad authorities, especially in matters relating to foreign railways, and head of the Transportation Department in Wisconsin University School of Economics till 1905, when Governor La Follette called him to the Railway Commission of Wisconsin, says: "In the invidious American sense of the word, the Prussian railways are most emphatically not in politics. There are no paid lobbyists, no subsidized newspapers, no partizan publication bureaus, no 'rake-offs.'"

3. The German railway management is the most enlightened and efficient in Europe. This is the opinion of the large majority of all railway authorities in Europe, and many think the German management is the best in the world.

The safety attained on the German roads is one of their strongest titles to respect. We kill more people on our roads every week than are killed on the German roads in a year. Taking the averages per million for our railroads and those of Prussia, we find that the railways of the United States kill over six times as many and injure twenty-five times as many passengers as the Prussian roads, while our rate of employees killed is more than three times and of injured twenty times that of Prussia.

The management of the German roads is very progressive. Nowhere in the world is technical education carried to a higher point than in Germany, and nowhere else is technical training so insisted upon as a condition of entering the railway service.

Results
Expert engineers are constantly at work devising improvements, and commissioners are sent all over the world in the search for new ideas and methods.

Altho a large profit is realized on the State railways, this is not the first aim of the management, but is regarded as subordinate to the efficient service of the public and the development of industry. And so well has this primary

purpose been fulfilled that the railway policy has been a very large factor in the astonishing industrial development of modern Germany, which has won the admiration of the world.

The profits of the German railways are very large, amounting to one third of the total receipts, and the net annual profits for the last ten years, after covering interest, depreciation, extensions, improvements, and sinking funds, have averaged between 5 and 6 per cent on the total cost.

The German railways treat their employees well; take every reasonable precaution against killing or maiming them; carefully avoid overworking them; pay them excellent wages according to the general wage level in Germany; pension them when their working-days are over, and make provision for their widows and orphans, and give them a share in the management of the roads through their right to help elect the representatives who finally determine the policy of the railways and the conditions of the railway service.

The crowning glory of the Prussian railway management in the employment department is a civil-service system. The higher employees must have a university education or graduate from a technical school before they take the State examinations for the railway service. Construction men, engineers, etc., must take a thorough technical course and then pass two State examinations, and before they take the second of these examinations they must have been in practise a number of years, eight to ten years' successful practise in private employment being the ordinary basis for the second examination. So the State railways get the cream of the technical skill of the country.

The Germans believe that whoever owns and operates a country's transportation system virtually owns the country; and that the public highway should be managed for the public benefit and not for private profit. This is the keynote of their railroad philosophy.

B. SWITZERLAND

Until the twentieth century the railways of Switzerland were in private hands. Now all the principal lines are owned and operated by the government except the St. Gothard, which is to be taken over in a few years when the franchise conditions permit.

The question of State purchase was first submitted to the people on a referendum vote in Dec., 1891, with the following result: For purchase, 130,500; against purchase, 290,000. In Feb., 1898, the question of national ownership of railroads was again submitted, a referendum being taken on an act providing for government purchase of the five main railroad lines of Switzerland (the Jura-Simplon, the Northeast, the Central, the Union, and the Gothard), with nearly four fifths of the total mileage of the country, or 1,758 miles, against 480 miles for all the rest of the roads ("secondary railways") combined. The question had been long and bitterly discust. The arguments pro and con had been thoroughly considered. This second vote was as follows: For national purchase, 384,382; against purchase, 176,511.

The most vital railroad abuses we suffer from were practically unknown in Switzerland. There was no fraudulent stock, no rebate system, no railroad lobby at the national capital. The best informed authorities in the universities, and even Dr. Zemp, the minister of railways, never heard

of a case of discrimination; and political corruption had been very rare.

The battle was fought on the broad principle of the superior social, economic, and political value of public ownership of public utilities as compared with private ownership even when honest and efficient.

The opposition was very strong, but it did not spend its strength wholly in argument, by any means. Tremendous pressure was brought to bear wherever possible to prevent men from signing the petition for the referendum. It was even charged that foreign money was used to defeat both the petition and the affirmative vote at the polls, and that paid agents were employed to propagate the opposition. In some states or cantons even the influence of the State government was thrown against the measure.

The railway referendum petition was signed in a short time by 85,000 voters, 55,000 more than were necessary, or nearly three times the needful number.

Under the provisions adopted by government resolution in 1852 and substantially incorporated in the railway charters of that and subsequent years, the Federation might take the railways at stated times (the thirtieth, forty-fifth, sixtieth, etc., years of the franchise) on giving three years' notice, and paying twenty-five times the average net profits for the ten years preceding the announcement of purchase, or the construction value, whichever rule produced the larger sum in any case, deduction being made for any sum necessary to bring the road up to standard condition.

An agreement was reached with the Central in 1900, with the Northeast and Union in 1901, and with the Jura-Simplon in 1903. When the State took the control as little change as possible was made in the staff or the ranks of employees. The four railway systems were coordinated, including nearly the whole of the primary railways, in a one-government system. The Gothard is not to be taken over until 1909. Notice of purchase was given the road in 1904, and negotiations were opened with the subsidizing countries—Germany and Italy—to secure an agreement with them.

The service on the Swiss railways will not compare favorably with ours. Neither will their stores and factories for the most part, but the government railway service is better than the company service was in Switzerland.

The third-class cars, in which the bulk of the people ride, are cleaner and the speed is better than in many parts of France, and they are heated from the engine instead of using the hot-water bottles so common in third-class French and English cars.

Local conditions account for the fact that rates are high in Switzerland, not so high as they were under the company régime, but still higher than those in use in most other countries.

The average ton-mile rate on goods traffic was 2.84 cents under the companies just before the transfer, and 2.64 cents in 1903, the first year of complete public management. These

Results

rates are high, but it must be remembered that they include the express; that Switzerland is a nest of mountains; and that the soil is poor, the resources small, and the traffic light. Remember, too, that there are no rebates or secret rates in Switzerland to cut down the average rate.

The average passenger rate was 1.54 cents a mile under company management and 1.35 cents

under public management. The third-class rates, on which about nine tenths of the people ride, average only a shade over a cent a mile (1.12 cents). Commutation tickets are sold for $\frac{1}{4}$ of a cent a mile third class, and tickets for working men and school children are $\frac{1}{2}$ of a cent a mile (1 cent a mile second class and $\frac{1}{4}$ cents if you want to go first class, which is entirely unnecessary, as the other cars are very comfortable). Circular tickets are sold at low rates for touring the country. Monthly tickets can be had allowing you to travel without limit on any of the railways of Switzerland at \$11 third class, \$15 second, and \$22 first. For a six months' ticket you pay \$45, \$59, or \$104, according to class.

P. ITALY

Italy transferred her railways from private to public management July 1, 1905.

In the earlier years of railway development Italy tried various plans. The State built some roads and bought others. It tried State management, but on a small scale and under bad conditions. Down to the eighties most of the roads were owned and operated by private companies. Then came a period of State ownership with private operation under contracts reserving to the government more than a quarter of the gross receipts and providing for the annual payment of specified amounts per mile to reserve funds for renewal of track and rolling-stock.

From 1859 to 1870 the principal railways of Italy consolidated into four main systems—the Upper Italian, the Roman, the Eastern, and the Sicilian. The latter becoming bankrupt, the government had to choose between giving up the development of that part of the country or taking the railroads. In 1870 it chose the latter alternative, adopting State ownership of these lines with operation by a company receiving a percentage of gross receipts, the State paying all expenses and realizing a handsome deficit each year. In the seventies the government entered into contracts for the purchase of the Roman, Eastern, and Upper Italian systems, with the idea of State operation, but financial difficulties prevented the completion of the purchases until 1882. In 1876 the parliamentary idea turned toward private operation either by companies, paid by the government, it also paying the expenses and taking the risk and the profit (if there should happen to be one), or by companies paying the State for the use of the lines and taking what might be left for themselves, or by companies operating under some sort of expense-dividing, sliding-scale, profit-sharing arrangement.

In 1878 the whole question was referred to a commission which reported in 1881 in favor of leasing the roads on a sliding-scale division of gross receipts between the government and the companies. It opposed State management for Italy for several reasons: (1) The necessary funds were not available. The government had not been able to complete its purchases. The Eastern road was still unpaid for. Some 3,000 miles of new road in addition to the 5,000 miles then open were required and had been voted in 1879, but the work was languishing for lack of funds. (2) Political conditions were not adapted to State management. Politics would corrupt the railways; changes in rates would be made to influence elections. Political difficulties had been already experienced with the State roads in Italy. (3)

State management appeared to be more costly than private, the percentage of expenses to receipts on the State railways of Belgium, Austria, etc., being higher than on the private systems.

The result was that contracts were made with two operating companies. The companies bought the rolling-stock owned by the State, and agreed to pay for ordinary repairs. For extraordinary repairs and renewals reserve funds were established. The State was to have about 28 per cent of the gross receipts and the companies 63 per cent or less if the receipts rose above a specified minimum. The contracts provided for low rates for agricultural products and for working men and school children, and stipulated that the railways should carry the mails free of charge. The term of contract was sixty years, with the right of termination by either party at the end of twenty years (1905) or forty years (1925).

The arrangement did not work well, and it worked worse and worse as time went on. The companies would not interpret the contracts liberally in the public interest, but insisted on the letter, and evaded even that. They disputed every point, and tedious litigation seemed to be specially delightful to them.

In 1906, the earliest date the government had a right to take the roads, Italy adopted State management, paying the companies for the rolling-stock and other movables. Recent witnesses state that the immediate or substantially immediate effects of the change were a decided improvement of the service, the running of trains more nearly on time than under the chronic and extravagant delays of the company régime, the raising of wages somewhat, the better treatment of employees generally, and the relief of commercial interests and of the public in general from the fear of railway strikes, which was a disturbing element under the company system.

G. AUSTRIA-HUNGARY

In Austria railways were not encouraged until 1838. Then the government authorized railway construction, guaranteeing each railway a monopoly in its district for its charter term. The State also proceeded to build lines of its own on a large scale. The revolution of 1848 put the government in financial straits, and it sold most of the State railways to help the treasury. After 1866 the growth of the private railways was very rapid, owing to speculative building. The usual collapse followed. "The railway speculation which ended in the crisis of 1873," says a high authority, "was perhaps more recklessly carried on in Austria than anywhere else in the world, and resulted in very great distress."

In 1877 the government returned to the State-ownership policy, and by purchase and construction built up a considerable system of public roads. In 1885 Austria had 2,000 miles and the companies 6,000; and Hungary had 2,000 miles of State railway and 3,000 miles of private road—a total of 4,000 miles of State roads and 9,000 miles of private. The statements of 1905 (for the year 1903) show 7,297 miles operated by the government in Austria against 4,985 in the hands of companies, and 9,207 miles operated by the government in Hungary against 1,861 miles operated by companies—16,504 miles for the State and 6,846 for the companies.

It has been the policy of the government to reduce rates, especially passenger rates, in order

to stimulate intercourse and also to scatter the people of the capitals into the suburbs. The zone system, which produced such a wonderful increase of traffic that it has become world-famous and well deserves its celebrity, was first introduced in Hungary in 1889, and attained its highest success there.

Tickets are sold by zones, and are good for all stations within the same zone. The first zone runs from 1 to 15 miles, the next from 16 to 25 miles, and so on, the steps in making the bigger zones being longer, and beyond 140 miles all stations are included in the same zone. The rates are 10 cents third class on ordinary trains and 12 cents on express trains for each zone. If

Zone System your journey takes you over 2 zones, as, from a station in zone 1 to a station in zone 3, you pay 20 cents (or 24 cents express). If you cover five zones you pay 50 cents (or 60 cents express), and you can go any distance for \$1.60 (or \$1.92 express). For local traffic special rates are made, 4 cents to the next station from where you are in the same zone and 6 cents to the second station.

For short distances the rate is about 1 cent a mile or less; for long distances it runs down to about $\frac{1}{4}$ of a cent a mile. If we had the same rate here one could go from New York to Chicago for \$3 instead of \$20, and from New York to Philadelphia for 32 cents instead of \$2.50. We cannot expect so much reduction, of course, because costs are greater here, but that difference does not require six to eight times higher rates.

The zone rates, as compared with the previous rates in Hungary, caused a reduction in fares of 82 per cent on the longest distances and 50 per cent on the medium distances, 60 to 200 miles. The average reduction in the charges per passenger was about 50 per cent on the whole traffic, and the stimulus to travel was so great that the business much more than doubled the first year, as is shown in the table:

| | Passengers | Passenger receipts |
|-----------------------------------|------------|--------------------|
| Aug., 1888, to July 31, 1889..... | 5,684,845 | \$3,800,000 |
| Aug., 1889, to July, 1890..... | 13,456,712 | 4,620,000 |

The simplification of the tariff was immense. Tickets are sold like postage-stamps at the post-office, hotels, etc.

In Austria also the zone system was an admirable success, but the rates were set too low at the start and some increase was necessary. The principal companies have also adopted the zone system under "soft pressure" from the government.

In addition to the zone tariff there is a system of excursion tickets and season tickets in books of 30 and 60 tickets each, at very low rates, amounting to about $\frac{1}{4}$ to $\frac{1}{2}$ of a cent a mile in many cases third class, and 1.2 cents first class—600 miles of travel for example for \$2.68 third class and \$5.36 first class, 1,200 miles for \$4.80 third class and \$10 first class, etc. Large discounts are made on weekly tickets for working men.

The zone idea is not applied as a complete system to freight traffic, but the principle of tapering rates, or lower mileage charges for long distances, is in use, and special rates are made as in Germany and Belgium; and agriculture, education, etc., are encouraged by very low rates. The farmers can buy transportation stamps and bill their goods at home by a very simple system.

There are no free passes or rebates or unjust discriminations on the State roads, and the government control over the private railways is so strong and the inspection so thorough that there is little chance for favoritism in their management either. The efficiency of the railway management does not appear to be interfered with by political influence. Premiums are given to en-

gine-drivers, etc., for economy in fuel, etc., and to officers for getting locomotives out of repair shops quickly, so as to have them in service as continuously as possible.

The most interesting thing about the State roads is the purpose the management keeps in view. The Austrian minister of railways, in answer to a question as to purpose, said that they did "not aim at profit, but at the best possible service at reasonable cost." The Hungarian minister at the time the zone system was introduced with its great reductions in rates stated that the main reasons were "the economic and civilizing effects of such a reform." The government desired "the removal of the disadvantages attending long-distance travel because of its high cost, and the elimination of the element of distance so far as possible." The government aimed "to establish methods which would place the reduction within the reach of all and adapt them to the requirements of all classes of the entire population," and to adopt "a system that should contribute effectually to the development of traffic, and compensate, indirectly, for the sacrifice which the large reductions in the tariff would involve."

As it turned out, the anticipated financial sacrifice did not occur, but the fact that the motive was social, not financial, is none the less clear. The government policy is to use the railways as a means of civilization and unification. The civic and social benefits of such a policy can hardly be overestimated.

H. NEW ZEALAND

New Zealand nationalized her railways in 1870, and between \$60,000,000 and \$70,000,000 in land and money were appropriated for railway expansion and improvement in the next ten years. This for a community of 250,000 was a bold bid for development; equivalent in fact to an appropriation of \$18,000,000,000 or \$20,000,000,000 for public improvements in the United States to-day.

In 1887 a Conservative government, headed by Sir Harry Atkinson, put the railways in control of a commission or trust consisting of three members appointed by the governor for a five-year term and not removable except for misconduct. It was a commercial system, and its managers, during their five-year terms, were almost as much beyond the reach of the people as the managers of our private roads. The divorce between the people and their Parliament on the one hand and the railways on the other was complete.

The result was that the roads were run for profit; the rights of shippers and of labor were disregarded; even the public safety was poorly cared for, all for the sake of a pretty balance sheet. The commissioners were honest; there was no corruption, no secret rate-making or favoritism among shippers, no effort to make money for the managers themselves; but they looked at the roads from the standpoint of private business and the class interest of the big taxpayers so far as the making of a profit and the disregard of the people's wishes were concerned.

The Conservatives went out of power in 1890, and in 1893 the abolition of the commission was made an issue in the campaign, and the people, by an overwhelming majority, elected representatives pledged to put the roads under direct control of the minister of railways and the Parliament.

In 1894 this change was accomplished, and

since then New Zealand has had real public ownership and operation of her railways. Subject to excellent civil service regulations, and appeal boards that settle all difficulties between officers and employees, the roads are in the hands of the minister of railways and the general manager appointed by him, with the ultimate control in the elective government, which, in fact as well as in name, represents the whole people. The result is that the roads are no longer run for profit but for service.

The determination to give rate concessions as fast as the profits rise above 3 per cent has resulted in reductions of passenger fares and freight rates amounting, during the period of rising wages and general prosperity, from 1895 (when the roads came into public control) to 1902 (the last report at hand), to a sum equal to nearly half the total receipts in 1895, equivalent to \$500,000,000 of railway reductions in the U. S., where, in these same years of prosperity, the private railways have been raising their rates instead of lowering them. While reducing passenger fares and freight rates by what the minister justly calls "a stupendous amount to have been given away in concessions by way of (voluntary) reductions to the users of the State railways," reductions amounting in some cases to as much as 20 or even 40 per cent in a single year on large classes of traffic; while seeking thus to develop the industries of the country to the utmost, the management has greatly improved the service, and carefully adjusted the railways to industrial and social needs. Railway construction is arranged so as to be most vigorous in dull seasons, taking up the disengaged labor that might otherwise be unemployed, helping to balance and steady the market, and enabling the State to build its roads at lower cost than if construction were mainly carried on at times of industrial pressure and high prices. In the farmer's busy season work on the railways is slackened so that men can go to the farms in the harvest time when extra hands are needed there. The roads are used at cost or less to redistribute the unemployed and to settle the people on the land. The Railway Department works in harmony with the Labor Department in securing work for the workers, and men are carried to points where their labor is needed, and, if necessary, their fares are advanced, and they may pay them back to the government from their earnings when they are able. A definite effort is made to relieve the congested quarters of the cities and attract the tenement dwellers to suburban homes.

Working men's tickets in and out from the principal points are sold at two shillings a week, or twelve rides for forty-eight cents, within any ordinary reasonable distance. Working men going ten or twelve miles out, as many do, travel about three miles for a cent, or a four-cent fare each way.

The railways are used to aid the cause of education. Children in the primary grades are carried free to school. Older children pay \$2.50 to \$5, according to age, for a three months' season ticket up to sixty miles. This gives them a possible 120 miles a day for three to six cents, in round numbers, or twenty to forty miles for a cent. If a child goes in and out six miles each day, he rides twelve miles for three cents. Excursions for school children are arranged in vacation time at the rate of fifty cents for a hundred miles out and back—200 miles for fifty cents, or

four miles for a cent. For teachers and pupils above fifteen years of age the charge is \$1 for the same distance. The minister figures that the department loses on these trips at four miles for a cent, but he justifies the low rates for school and factory excursions on the ground that "from an educational point of view very marked and beneficial results must follow," thus subordinating the lower forms of wealth to the higher.

This New Zealand record is of great interest, not only for the admirable illustrations of railway usefulness under the rule of enlightened public spirit in the last few years, but also for the experience of former years under the commission management, showing that abnormal or fictitious public control, or control by officers representing a class interest and beyond the reach of the people, may lead to results in many respects quite similar to those attained by private ownership and operation, and directly contrary to the effects of public control representing the whole people.

For other countries, see those countries.

III. Railway Problems

The principal railway problems cluster about the ideas and principles represented by the following terms: Combination, Discrimination, Monopoly, Overcapitalization, Stock-Gambling, Railway Politics, Safety, Service, and Employees.

I. COMBINATION

The tendency of combination in the railway world is strong. There have been about 5,000 railway companies in the United States. More than half of them have disappeared; a few of the roads being abandoned and some reorganized with change of name, but most of them merged, consolidated, leased, or otherwise absorbed and made a part of some other system. There are now a little more than 2,000 companies, between 800 and 900 of which are reported by the Interstate Commerce Commission as "independent companies." Most of these "independent roads," however, are banded together in six great groups or families—the railways of each group being dominated by one little knot of capitalists. These groups are known as the Vanderbilt, the Morgan-Hill, the Gould-Rockefeller, the Pennsylvania, the Harriman, and the Moore groups. The Pennsylvania group includes 280 companies, with 19,300 miles of road. The Vanderbilt system extends from Boston to the Missouri River and the Dakotas, including 132 companies and 22,000 miles of line, equal to the entire railway system of Great Britain and Ireland. The Morgan-Hill group covers the continent from New York to the Pacific, with 240 operating companies and over 50,000 miles of road, or more than the whole of the railways of Germany, and more than the entire mileage of the United Kingdom and France together.

The six giant railway systems dominate together over 90 per cent of the vital railway mileage of the U. S. And these six vast aggregations are themselves by no means independent, but are intertwined, affiliated, and coordinated with each other by the interlocking interests of their owners, common holdings, and overlapping ownership of shares, interrelations of boards of direction, and various agreements and understandings.

The Vanderbilts have an interest and control in the Reading jointly with the Pennsylvania, and the Morgan people also retain some interest in it,

tho they no longer dominate it. On the other hand the Lehigh Valley is part of the Morgan cluster, but both the Pennsylvania and the Vanderbilts have an interest in it. Four Baltimore & Ohio directors represent the Pennsylvania road, four represent the Harriman group, and two are appointed to represent the State of Maryland. The Chicago & Northwestern, which is a Vanderbilt road, has on its board one of the leading Harriman men of the Union Pacific and Southern Pacific boards. J. P. Morgan, head of the Morgan group, is a director in the New York Central, the controlling company of the Vanderbilt system. William Rockefeller, representing still another group, is also a director in the New York Central. George J. Gould, head of the Gould system, is a director in the Union Pacific and in the Southern Pacific, both of which belong to the Harriman group. E. H. Harriman, president of the Union Pacific & Southern Pacific, is on the board of directors of the Northern Pacific and of the Chicago, Burlington & Quincy, which are Morgan-Hill lines.

Mr. Moody, our highest Wall Street authority on trusts and combinations, says in his book, "The Truth About the Trusts":

The Pennsylvania Railroad interests are on the one hand allied with the Vanderbilts, and on the other with the Rockefellers. The Vanderbilts are closely allied with the Morgan group, and both the Pennsylvania and Vanderbilt interests have recently become the dominating factors in the Reading system, a former Morgan road, and the most important part of the anthracite coal combine, which has always been dominated by the Morgan people. Furthermore, the Goulds, who are closely allied with the Rockefellers, are on most harmonious terms with the Moores of the Rock Island system, and the latter are allied in interest quite closely with both the Harriman and the Morgan groups. . . . The dominating men in the Morgan group are also important factors in the Gould, Pennsylvania, and Moore groups; and the Rockefeller-Gould interests are represented to a greater or less degree in every group, and also in most of the "independent" allied lines. The whole aggregation thus makes up a gigantic "community of interest," or Railroad Trust, being allied together by most remarkable and intricate ties of interdependence and mutual advantage. While nominally controlled by 2,000 corporations, the steam-railroads of the country really make up a mammoth transportation trust, which is dominated by a handful of far-seeing and masterful financiers. . . . Not only do these financiers dominate their respective groups, but, as stated above, the most important of them, such as Rockefeller, Morgan, Harriman, Gould, and Vanderbilt, are interested in and more or less dominate all the groups, and in this way knit together the entire railroad system of the country into this greater "community" or "trust." The superior dominating influence of Mr. Rockefeller and Mr. Morgan is felt in greater or less degree in all the groups.

In the great railway groups and the stupendous Railroad Trust they are developing, the tendency is toward the concentration of control in fewer and fewer hands. Not only are railways absorbed by the wholesale, consumed more rapidly than they are produced, and the resulting systems gathered into enormous groups, but inside these systems and groups the movement is toward one-man power.

Already, as I am informed by a leading member of the U. S. Interstate Commerce Commission, half a dozen men can meet and practically determine the transportation rates for the country. And the forces of integration and industrial gravitation that have operated so powerfully in the past are not likely to stop even with this high degree of centralization.

"In Chicago," says Spearman, "the five men who in authority that is absolute are traffic directors of two thirds of the U. S. may be found almost every day within a few moments' walk of each other."

¹ "Strategy of Great Railroads," p. 169.

If these movements, the merging of railways into great systems, the gathering of these systems into giant groups, the interlocking and coalescence of these groups, and the progressive narrowing of control in each constellation of capitalists, continue to the limit, there will be in time a railway empire in this country dominated by a single man. The Railroad Trust may never reach this degree of concentration, but the most strenuous devotee of decentralization and compulsory competition must admit that the coming of such an aggregation, viewed from the standpoint of existing conditions and tendencies, cannot be deemed so unlikely as the present concentration would have seemed to railway men, statesmen, or economists fifty years ago.

Government consolidation does not bring these dangers. The consolidated railways are managed, as we have seen above, by men who are trustees for the people and responsible to them. In America the tendency is to weld the roads into an empire, a consolidation under a management responsible to a few gigantic stockholders, dominated at last perhaps by a single autocrat, a czar of all the railways.

The motives that impel men to build these giant combines by consolidation or coordination relate partly to the economies and transportation benefits of union, and partly to the personal profit and power of those who control the combines. The first motive and its consequences are in line with the public good. In so far as combination eliminates the wastes of conflict and secures the benefits of harmonious cooperation in the railway service, it is a gain to the community. But in so far as it conduces to the financial ascendancy of Wall Street and intensifies the commercial supremacy and industrial dominion of a few great capitalists, it is a political, industrial, and social danger. The railways united form a much more extensive interest than the government from an economic point of view; already they outrank our state governments and dominate the political affairs of sovereign commonwealths, and as a unit in the hands of a gigantic trust they might even overshadow and control the national government itself.

2. DISCRIMINATION

More than sixty different forms of railway favoritism are on record in the evidence brought out by various suits in our state and federal courts, and in hearings before the Interstate Commerce Commission.

For a full account of these various forms of discrimination the reader must be referred to "The Heart of the Railroad Problem," published by Little, Brown & Co., of Boston. Only a few of the many kinds of railroad discrimination can be illustrated here.

One of the most prevalent discriminations is the charging of higher rates for a short haul than for a longer distance. A few cases will make the subject clear:

From Pittsburg to Colorado the rate on rails was found to be \$1.60, while the rate all the way through to San Francisco was only 66 cents. From Pueblo to San Francisco, 1,559 miles, the rate on bar iron and on rails was \$1.60 per hundred, while from Chicago to San Francisco, 2,418 miles, the rates were 50 cents on bar iron and 60 cents on rails; and even from New York to San Francisco the same rate of 60 cents was made for rails.

The Denver merchant pays \$2.24 per hundred on goods from Boston, while the same trains carry the same sort of goods all the way from Boston to San Francisco, a thousand miles farther west than Denver, for \$1 per hundred. In

other words, Denver pays over twice as much as San Francisco for two thirds of the distance.

Mr. Kindel has been driven out of the manufacture of upholstering goods and of spring beds in Denver because of similar differences. He also wished to manufacture albums in Denver, but was forced to locate in Chicago because the freight rate on books from Chicago to San Francisco was \$1.75 per hundred, and from Denver to San Francisco \$3, while the Denver manufacturer had to pay 97 cents freight on his raw material (paper, etc.) from Chicago to Denver—\$3.97 total against \$1.75 for the manufacturer located at Chicago.

Spokane supplies another illustration of place discrimination. For example, the dealer in paints and oils at Spokane must pay \$1.21 a hundred from Chicago against 90 cents from Chicago to Seattle, 250 miles farther west. The Spokane dealer pays \$93 more freight per car than the Seattle dealer pays for 250 miles more transportation.

The rate on bariron from Chicago to Spokane is \$2.07 a hundred against \$1.25 to Seattle; iron pipe \$1 to Spokane, 50 cents to Seattle; lamps \$2.35 to Spokane, \$1.10 to Seattle; belting \$3.13 to Spokane and \$1.65 to Seattle; mining-car wheels \$1.26 to Spokane and 85 cents to Seattle; cottons \$1.75 to Spokane, 90 cents to the coast; soap (toilet) \$1.23 to Spokane, 75 cents to coast cities; wire and wire goods \$2.35 to Spokane, \$1.50 to the coast; sewing-machines \$2.25 to Spokane, \$1.40 to the coast; typewriters \$5.96 to Spokane, \$3 to the cities of the coast.

In general the rates from the East to Spokane are the through rates to the coast plus the local rates from the coast back to Spokane.

The preference which Tacoma, Seattle, etc., have over Spokane is about 80 per cent, which has proved quite sufficient to enable dealers on the coast to ruin some important business interests of Spokane.

Iowa supplies another excellent illustration of the grievous place discriminations practised by the railroads. Iowa's farmers are asking why they should have to pay 50 to 100 per cent more for shipping their products than the Nebraska farmers who live several hundred miles farther west.

In the South many complaints have been made of a railroad method called the "basin-point system," which rests on the same principle of discrimination in favor of competitive railway points that is in vigorous use in all sections of the country. The railroads name certain towns as distributing centers and competing points, fix the rates to and from these points, and make rates to and from other localities by adding to such through rates the local charges in force between the distributing centers, or "basin points," and said other localities.

The commission says, "Our annual reports to Congress and reported decisions in cases have uniformly condemned this distributing-center theory of rate-making, but the Southern carriers have resisted our efforts to correct the practise," and the courts have refused to compel them to obey the orders of the commission, holding that differences of condition created by the railroads themselves are insufficient to take the case out of the law, a ruling that practically destroys all the strength of the long-haul clause.

Rebates constitute another of the principal forms of railway discrimination. The word is used in railway literature in two different meanings. In the narrow sense it means a sum of money paid back to a favorite shipper as a refund upon his freight rate. In the broad sense it means any sort of favoritism—any concession or preference that accomplishes the same purpose as a refund on freight rate—any unjust discrimination that gives one shipper or certain shippers an unfair advantage over others.

Years ago, A. J. Cassatt, of the Pennsylvania Railroad, testified that in eighteen months the Standard Oil had received \$10,000,000 in rebates, and recently Secretary Garfield has reported to President Roosevelt that the Oil Trust is still receiving from the railroads large amounts in rebates.

Investigations by the Interstate Commerce Commission, Dec., 1901, and Jan., 1902, took the lid off of the drest-meat business sufficiently to show that the Pennsylvania and Vanderbilt lines and other roads were giving the big packers discounts of five to seven cents a hundred from the published rates. These rebates of 15 to 30 per cent amounted to \$200,000 or \$240,000 a year on the Michigan Central, according to the traffic manager of that road, and Paul Morton, of the Santa Fé, when asked by Commissioner Clements, "Can you tell how much you paid in a year on this business? Have you any idea whether it is \$50,000 or \$100,000?" replied, "I think there was a great deal more than any sum you name paid out."

A Massachusetts legislative investigation of the Boston & Albany in 1900 revealed the fact that favored shippers were getting reductions of 10 to 75 per cent from the published rates, while others, some of them doing considerable business, got no discounts at all but paid the full tariff. The reductions from published rates averaged 40 per cent. The receipts per ton-mile on all classes of freight were less than one half the average of the published rates to the various stations on the road for the cheapest class of freight, viz., coal. And the lowest published local rate on coal was higher than the average rate on all commodities.

From time to time the railroads have declared that they had stopped rebates and discriminations. They said so in 1887 when the Interstate Commerce Act went into force; they told the commission the same thing in 1898 and at other times of special investigation; they took their oaths to it again in 1905; railroad presidents and managers by the car-load going to Washington to testify that since the Elkins Law took effect (Feb. 19, 1903) rebates and discriminations had ceased.

But James J. Hill and Victor Morawetz and other leading railroad men declared that rebates and discriminations had not ceased and never would cease. The Elkins Law did not even pretend to touch the multitudinous and grievous discriminations between places, a few examples of which have been given above; the great mass of discriminations by expense bill, classification, commissions, underbidding, fictitious claims, terminal tracks, icing charges, etc., went merrily on, and even the direct cash rebate remained in vigorous use, the testimony of railroad men to the contrary notwithstanding.

Governor La Follette unearthed more than \$7,000,000 of rebates in Wisconsin, a large part of which were of later date than the Elkins Law. In fact the total rebates paid the year after the Elkins Law went into effect were greater than the total for the year before. For example, the Northwestern Railroad jumped from \$212,075 rebates in 1902 to \$410,476 in 1903, mostly after the Elkins Law took effect (Feb. 19th). The officials of this road, like those of many other roads, had affirmed that rebates had ceased, but when the lid was taken off the facts did not agree with their statements.

The fact is that a much larger number of complaints of discrimination have been made to the Interstate Commerce Commission in the last few years, since the Elkins Law was passed, than in any equal period before.

The average number of complaints per year from 1887 to 1902 inclusive was 186, while the yearly average for 1903-5 is 534—more than double, nearly threefold in fact—and five sixths of the suits entered charge facts that constitute discrimination of serious character, and nearly all the rest involve discrimination in some form.

Private cars owned by shippers or car-line companies constitute another favorite means of discrimination. The railways pay the Standard Oil, the Armour Car Trust, and other owners of private cars mileage rates on their cars, which serve the same purpose as a rebate.

The earnings of an Armour refrigerator-car range from \$1 to \$2 a day from mileage alone, and the mileage payments even at \$1 a day are sufficient to pay the whole cost of the car in three years and its maintenance in the meantime.

A railroad pays twenty cents a day for every day it uses a car belonging to another railroad, but for a private stock car the railroad pays on an average sixty cents a day, and for a private fruit or dairy car it pays \$1 or more. Private stock cars in some cases net their owners 50 per cent a year on the invested capital, repaying the cost of the cars in two years, above operating expenses.

In addition to the mileage, the railroads pay the car-line commissions of 10 and 12½ per cent in some cases, repair the cars, bill shipments 15 to 30 per cent or more below their real weight, and issue annual passes to the owners and their agents.

With these advantages the owners of private cars are able to control a vast amount of business besides their own by offering a share of the mileage receipts and other inducements to large shippers. Having gained control of the refrigerator business the Armour car lines advanced the icing charges to ordinary shippers from 50 to 100 per cent, thus still further emphasizing the discrimination between big and little shippers.

Another method of preference without departing from published rates is the division of rates

with private terminal companies or mere switching roads, or roads existing only on paper.

Take for example the Hutchinson salt case (1903). There are sixteen salt-mills in Hutchinson, Kan., nine of which are combined in what is known as the Salt Trust. The rest are independent. The president of the Salt Trust was Joy Morton, brother of Paul Morton, who was head of the traffic department of the Santa Fé Railroad. The Salt Trust owns some switch tracks around the mills amounting in all to less than a mile of track. They incorporated this as a railroad company and asked for a division of rates. The Santa Fé gave the trust railroad 25 per cent of the through rates, equivalent to a rebate of fifty cents a ton on shipments to Missouri River points, so that the trust was enabled to drive the independents out of those markets and take their packing-house contracts away from them.

The Harvester Trust's works in Chicago have some Lilliputian switching railroads to which the big roads gave a 20 per cent division of rates so that the vest-pocket trust roads get about \$12 on an ordinary car for a switching service which, till the end of 1903, they performed at a charge of \$1 to \$2, 50 per car.

The Illinois Steel Company, now owned by the Steel Trust, also has one of those railroads which has a division of 10 per cent on business to New York and other seaboard points, 15 per cent to Pittsburgh, Buffalo, and other middle points, and 20 per cent on traffic to the Missouri River. These divisions amount to \$6 to \$12 a car for the switching service performed by the private road. Besides this, certain special divisions are made. On coke from the Connellsville region, for example, a division of 70 cents per ton is allowed. This gives the little switch road \$700 to \$1,000 for hauling a train of coke seven miles from Indiana Harbor to its plant in South Chicago, while the actual cost would not exceed one tenth of this sum.

The trust railroad in this case makes a net profit of 150 per cent a year upon its capital stock of \$650,000. How much the Steel Trust as a whole gets in this way through all the private railroads connected with its various plants is not known; but the commission says it is certainly a "sum sufficient to pay dividends on several millions of dollars of capitalization."

Other terminal railroad cases showing similar favoritisms are recorded by the commission. The fact appears to be that almost any shipper big enough to have a few hundred yards of switch track can get a rebate in the form of a division of rates. But some big shippers can get a much larger division than others, and some have not been able to get any division. Even the giants are not all treated with equal favor by any means.

Besides the kinds of discrimination above described, there are a great many other methods in vigorous use upon our railways, such as gifts of stock, tips on the market, elevator commissions, and compress fees; commissions to favored shippers as tho they were agents of the company to secure for it their own freight; salaries to favored persons as nominal employees, or fees for fictitious services; high salaries or commissions to a real traffic agent who will divide with the favored shipper; free cartage for certain shippers; free storage; unfair distribution of cars; delay of shipments; refusal of facilities or privileges accorded to others; special switches; extra speed; milling in transit rates; credit on payment of freight at destination; arbitrary routing of shipments; refusal to deliver at a convenient point; refusal to receive shipments from or to certain persons or places; false billing; underbilling weight; billing wrong number; false description; false destination; fictitious entries in the prepaid column of the freight bill; payment of fictitious claims for damage or overcharge; intentional mistakes in printing tariffs, a few copies being run off for favored shippers after which the "mistakes" are discovered and corrected for the ordinary shipper and the Interstate Commission; the "strawman" fraud, or billing to a fictitious consignee in whose name the drawback is arranged when the goods are rebilled to the true consignee; the "expense-bill" system, or billing at reduced rates on the fiction of uniting the present shipment out with some former shipment in to get the

Secrecy

benefit of a through rate; unfair classification and unreasonable differences in the rates on different commodities; loans to dealers in consideration of shipments; guaranty by the railroad against loss upon shipments; excessive difference in the rates for large and small shipments, or for shipments in different form—barrels and tanks for example; favoritism in switching charges, demurrage, storage, etc.; direct overcharges; annoying and expensive litigation; carrying goods without any charge at all or any record of the transit. Mr. Davis, representing seventy fruit associations of Chicago, told the Senate committee (1905) that large amounts of freight are systematically shipped without any billing or paying of freight, and Commissioner Prouty says: "I knew some years ago that a whole train-load of wheat was transported from Minneapolis to Chicago for nothing. There was simply no record of that shipment on the books of the railroad."

Secrecy is the main defense of the rebate system. The motives for discrimination are strong, the power to discriminate is great, the methods are legion, and secrecy foils the commission and the law. Neither the railroads nor favored shippers will tell the truth as a rule even on the witness stand, and other shippers for the most part dare not testify against the railroads even when they chance to have definite evidence of violations of law.

There is nothing like our railway favoritism in any other country. Everywhere in Germany, Denmark, Belgium, Austria-Hungary, etc., I found the government railroads absolutely free from unjust discriminations. The same is true of the government roads in the Anglo-Saxon colonies of Australasia and South Africa. The reasons are that the main motives to discrimination are eliminated, that much fuller publicity is possible, and that railway managers are employed by an authority that is opposed to discrimination and will discharge them if they are found to be breaking the law, instead of being engaged by an employer that asks only for profit and will approve and promote the manager if he wins that, whether through discrimination and breach of the law or not.

Government roads are not in the hands of men whose economic interests and business ethics command secret discrimination and evasion of law, but in the hands of public managers who would be traitors to the business ethics of their position as well as to the law if they broke the law or tried to defeat or evade inspection and publicity.

3. FOSTERING MONOPOLY

Our railways foster monopoly directly and indirectly. By consolidation and combination they are building up numerous monopolies in the railroad field, and by concessions to favored trusts and combines like the Standard Oil, the Beef Trust, the Sugar Trust, etc., they help to build up vast monopolies in manufactures and commerce. The Standard Oil monopoly was directly created by railroad rebate. The Beef Trust is another excellent illustration of a giant monopoly that owes its creation to the fostering care of railway discrimination.

A distinguished railway officer writing in the *Outlook* says:

It is estimated that \$500,000,000 have been converted into the treasuries of various trusts since 1887 by means of rebates and other forms of favoritism, and that present conditions

promise not an abatement but an expansion of the methods by which this diversion may continue."

The formation of vast industrial trusts began in 1872, when the anthracite coal combination was formed by an alliance of producers and carriers and when the interests which compose the Standard Oil Trust first began to work in harmony with each other and use the power of their railroad allies to clear the field of competitors. To-day there are 450 to 500 trusts, with an aggregate capitalization, including the railroad and other franchise trusts, of something like \$20,000,000,000. And still more trusts are forming and the limits of existing trusts are being extended and their interlocking interests increased and intensified. They are reaching out after the land, and the control of market, labor, and raw materials. They are establishing international relationships aiming to monopolize the globe in their lines of business. And they are joining hands with each other.

On the whole the situation seems to be this: The railways and other big franchise monopolies are coordinating with the great commercial combines into a gigantic machine controlled by a few financiers and created to manufacture or capture profit for them. Events are moving toward a consolidation of interests that will give a handful of capitalists practically imperial power through the vastness of their industrial dominions. There may be breaks in the movement, probably will be, but the integration of industry seems likely to continue in spite of strenuous efforts to prevent it by statutes and decisions. The Sherman Law and the antipool and anti-trust decisions have done nothing but change the forms and methods of union. So long as men are free to buy stocks and properties, and may consult with each other and act upon their conclusions, combinations will go on.

And the railways are generally regarded as forming the basis of the structure, or a large part of it. I have met with this opinion all over the U. S. and in some other countries.

The problem of private monopoly is one of the most serious questions before the American people, but in its relation to the railways it is rather a derivative than a primary problem, since it is the result of combination and discrimination.

4. OVERCAPITALIZATION

To railroad men from Germany, Denmark, Belgium, and other countries where the railroads are public property, nothing in our railway system is more astonishing—not even our railway favoritism and railroad politics—than the exhaustless freedom with which we allow our railroad manipulators to water and inflate the capitalization on which the people must pay dividends and interest. Here are some examples:

About 200 per cent of water was early injected into the stock of the New York Central and 177 per cent into the Hudson River Railway shares in a few years, altho there was already what many would regard as a sufficient quantity of water in the roads before turning on the hose.

By means of successive stock dividends and consolidation premiums as high as 80 and even 85 per cent at a single stroke of the syringe, the stock of the two roads trebled from 1867 to 1870, and the total capitalization shot up from \$54,000,000 of stock and indebtedness in 1866 to more than \$103,000,000 in 1870. Even this does not tell the whole story. The evidence is that the book value of the roads in 1870 was only \$60,000,000 and their real value less than \$40,000,000, while the actual amount paid into the treasuries of the companies for the whole mass of the stocks and bonds was probably below \$16,000,000, the rest of the construction value having been got out of the public, in addition to the interest and dividends, by means of excessive rates. So the bonds nearly covered the value paid in and the \$90,000,000 stock was practically all water.

A great railroad man said many years ago that "the Vanderbilt stock-waterings between New York and Buffalo annually cost the American people not less than \$3,000,000 in excess of all remuneration which even under any construction of right belonged to the owners of the lines."

Other railroads have surpassed this. The New York Central in 1869 reported a cost of \$63,306 per mile (and this included the bonuses, premiums, commissions, and fictitious equalization values of the transfers, etc.), while the main stem of the Erie Railway, extending 460 miles, from New York to Dunkirk, reported a capitalization of \$237,000 per mile in the same year. The actual cost, it is said, did not probably exceed one fifth of this amount. In other words, about 80 per cent of the capital was water, and the commerce of the country was taxed to pay dividends on over \$80,000,000 of fictitious values.

In the first four months after Gould and Fisk came into control of Erie (July to Oct., 1868) the stock was increased \$23,500,000, lifting the total to \$57,766,300. In these four

months and the four months preceding them, under a vote of the board of directors in practical evasion of the law, through the issue of bonds convertible into stock upon demand, the stock was increased \$33,536,300, or 138 per cent, in eight months. "Such a process of inflation," says the historian of Erie, "may, perhaps, be justly considered the most extraordinary feat of financial legerdemain which history has yet recorded."

In the eight years from 1863 to 1871 Erie stocks were jacked up from \$11,569,500 to \$86,535,700, mainly for the purpose of manipulating Wall Street.

The stock was sold below par, a good deal of it for twenty to forty cents on the dollar, and the larger part of the money went into the pockets of the directors or was used for corrupt purposes in New York and Albany.

In 1880, when the capitalization was \$135,000,000, a New York legislative committee, from the testimony of experts, estimated the value of the Erie road at \$65,000,000.

There are other sorts of inflation which find ample illustration in some of our best systems. The Pennsylvania Railroad, for example, claims \$193,000,000 as the cost of its 1,085 miles of road with all its equipment and the full value of its terminals and real estate, Jan. 1, 1905, while the total capitalization of the Pennsylvania road is \$418,000,000. What is the meaning of this great difference of \$225,000,000 between cost and capitalization? It means simply that the Pennsylvania Railroad has issued about \$220,000,000 of its own securities for the purchase of the stocks and bonds of other corporations, mostly railroads, the cost of these securities being reported at \$219,581,161. This method of purchasing the securities of one company or a group of companies by the issues of the stocks and bonds of another company results in counting a vast mass of railroad securities twice in the total capitalization of a railway system. The real values represented are counted once in the capitalization of the purchasing road and again in the capitalization of the roads in whose securities it has made investments.

This duplication is not by any means the end of the process. The Pennsylvania Railroad, for example, owns a large amount of stock in the Reading Company, and that company, in its turn, holds \$197,000,000 of value in the stock and bonds of other companies: \$40,000,000 in the Philadelphia & Reading Railway, \$87,000,000 in the Philadelphia & Reading Coal & Iron Company, and \$70,000,000 in stock and bonds of some fifty-three railroad companies and a few other companies, including practically the whole capital stock of the Reading Iron Company. The Philadelphia & Reading Railway Company with its \$90,000,000 of capital controls many subsidiary companies. The Reading Iron Company, of whose board of directors George F. Baer, president of the Reading system, is chairman, is to some extent an enigma. Poor says: "No official information can be obtained respecting this company; all requests therefor having been refused." But the fifty-three railroad companies above referred to have clear relations in respect to the matter under consideration. All or nearly all of them own stock in still other lines and carry the overlapping of securities still farther. For example, the Central Railroad of New Jersey (of whose stock the Reading Company owns 53 per cent) has altogether \$78,000,000 of capitalization and owns \$30,000,000 of the stocks and bonds of other companies, and "so on down." If anybody could take a year off for the purpose he might find out how much duplication, triplication, quadruplication, etc., there is hidden under the serene surface of the Pennsylvania Railroad capitalization. All the roads named in this paragraph are operating companies with separate boards of directors, and their stocks and bonds are counted in the general summaries of railroad capitalization in the U. S.

The Illinois Central Railway illustrates another method of inflation. The cost of the road as reported by the company in 1873 was \$48,331 per mile. Of this \$4,930 per mile is all that was contributed by the owners above their receipts; the receipts from land grant sales amounting to \$35,211 per mile, and stock-waterings amounting to \$8,189 per mile. The unsold land grant amounted to 344,368 acres, worth probably over \$5,000,000, so that those to whom the securities of the company were issued had obtained the road at a bonus of nearly \$2,000,000 above all they paid in.

The recent reorganization of the Chicago & Alton (1899) is a forcible illustration of one of the commonest methods of inflation. The old management had been extremely conservative and had never watered the stock. The road was capitalized at about \$30,000,000, or a little more than \$30,000 per mile. In the year just named the road was bought by a syndicate which paid \$175 a share for the common stock and \$200 a share for the preferred stock, making a total cost of \$40,000,000 for the \$22,000,000 of stock, while the bonds became \$54,000,000 in place of \$8,000,000, the reorganization lifting the capitalization at once from \$30,000,000 to \$94,000,000.

In the testimony before the U. S. Industrial Commission an effort was made to justify this vast infusion of water, \$40,000,000 beyond all the syndicate paid, doubling market values and tripling total face values, on the ground that the company had been earning over \$3,000 a mile and paying regular dividends of 7 and 8 per cent, and that it would not have to earn any more than it did before in order to pay interest and dividends on the new capital. The commission, however, did not agree with this view, saying: "It seems clear that the doubling of the capital stock and the increasing of the bonded debt nearly sevenfold must impose a burden upon rates that will tend to prevent any reduction which might otherwise naturally take place, and afford a convenient reason for refusing to advance wages."

Some of the worst cases of inflation have been due to construction frauds, or excessive payments to construction companies controlled by the same men who controlled the railways contracting with the construction rings for the building of the roads. The Pacific railways furnish some of the most famous instances of this sort. The Union Pacific paid \$94,000,000 for construction which cost \$51,000,000; the construction ring of the Central Pacific made a profit of \$62,000,000; and the promoters of the Northern Pacific, through unfair construction contracts and other frauds, made the capitalization of the 600 miles of that line constructed down to 1874 amount to \$143,000,000 on an actual expenditure of \$22,000,000.

The whole capitalization piled on the Union and Central roads was \$240,000,000, so that, taking the three roads together, a capitalization of more than \$383,000,000 was created on lines costing less than \$132,000,000, about \$250,000,000, or nearly two thirds of the capitalization, being fictitious.

Another way in which railway capital becomes inflated is the failure to eliminate dead capital from the system. Like other monopolies and semimonopolies, our railroads appear to think that capital has a claim to immortal life; and they are very much averse to writing off depreciation so as to keep capitalization down to the cost of duplication, as a manufacturer or producer in the competitive field is obliged to do. Each time a railroad system is rebuilt, the cost of the new system is added to the former cost, and the public has to pay dividends not only on the value of the existing road, but also on the old roads that have gone out of existence. If this process is continued, the railroads of the thirtieth century will be drawing interest and dividends on railroad capital that died in the twentieth century or the nineteenth century, and the men who own the railways may take the U. S. in part payment and sue for the rest of their interest claims. If it had not been for panic years and the intervention of insolvency proceedings in respect to many railways, we should have had a sky-scraping capitalization already from this one cause without any help from stock dividends, consolidation, etc.

In its final report, 1902, the U. S. Industrial Commission states that out of \$457,000,000 increase in railroad capitalization in 1900, only \$120,000,000 could be explained by new construction, the other \$337,000,000, or nearly four fifths of the whole, being due almost entirely to sudden expansions in securities, in processes of reorganization and consolidation. The commission further notes that the new issues for the first half of the following year to the end of the time covered by the evidence before them amounted to \$300,000,000, largely explainable in the same way.

Inflation of capital is regarded by many as a species of robbery. It is one of the most seduc-

tive methods of getting something for nothing which has yet been invented. The corporations and monopolies of America are greater sinners in this line than are to be found in any other country, and so far in most of our states little has been accomplished in the way of checking this evil.

5. STOCK-GAMBLING

Railway stocks constitute the backbone of speculation in Wall Street and corresponding centers of speculation in other cities. Panic after panic has been precipitated in Wall Street by the struggles of rival buyers to control the stock of some railroad. In 1901, for example, the stock of the Northern Pacific was forced up to \$1,000 a share, and one of the worst panics of recent years was the result. Those in control of railroads can easily make large sums by manipulating stocks so as to affect their values.

Railroad magnates are under great temptations to use their power for speculative purposes. By passing a dividend or paying small dividends or suddenly flushing the market with stocks, diverting earnings in commissions to favored concerns or otherwise, or beginning a rate war, or by other means, they can depress quotations. By paying large dividends out of capital if need be, or having their brokers buy for each other at advanced prices, or booming the stock in other ways, they can lift quotations. They know in advance of the public important facts that will depress or elevate values as soon as they are published, such as railway consolidations, leases or other agreements, additional franchises, good or bad showing of earnings, legislative action, and even foreign complications. If they control two or more lines between competing points, they can, by changing rates or otherwise, divert large amounts of traffic at will to either route, and so affect stock values. They can buy large blocks of stock at low rates, force the stock up, and sell at top prices. They can have many brokers, acting for them, take contracts for the future delivery of vast quantities of stocks they control or concerning which they have inside information so that they know the stocks will rise, and when the delivery is called for the persons who agreed to deliver must pay over the difference between the market quotations at the dates of agreement and the quotations at the time fixed for delivery. Or they can have their brokers sell short, knowing that the stocks will fall either because of their intended manipulations or because of facts not known to the purchasers.

Our railway system as a whole must not be deemed fraudulently speculative. Stock-jobbing is not the main purpose with most of our roads, though it is an element more or less strongly developed or else an incident in all. But our system leaves the door open to such practices and intensifies the prevalent longing for unearned gain by the prospect of the prodigious sums to be realized, and by the facilities afforded by the possession of irresponsible power.

From the standpoint of ethics and the effects upon character and society, it is difficult to distinguish between the winning of millions by betting on railway stocks, and winning thousands by betting in the Louisiana Lottery. It is a question whether the winning of money by the manipulation of stocks is not on a still lower plane than the buying of lottery tickets. It has more resemblance to playing with loaded dice or fixt cards.

6. RAILWAY POLITICS

From Maine to California for many years our railways have done their best to control the governments of our states and cities so far as they came in contact with transportation interests, and for the most part they have succeeded. Now and then a wave of popular sentiment has overcome their influence in legislative bodies, as during the Granger movement in the '70's, and the Roosevelt movement of 1906-7, but in the long run the railroads have been able to control in large measure the nomination and election of members of legislatures, and of the national Congress. (See CORRUPTION.)

"The railroads will buy up a legislature just as they buy a car-load of mules," said the governor of a great state in answer to my question about railroad influence in politics. "And they will buy elections, too, if need be. But as a rule they do not have to resort to bribery or corruption. Unless they get to fighting among themselves, or there is strong opposition on the part of the public, they can carry their purposes by milder methods."

"What methods do you refer to?"
"Well, they retain leading lawyers and politicians as counsel, or make them stockholders, and not infrequently directors or officers. They pack caucuses and conventions, subsidize the press, influence merchants and manufacturers by the grant of special favors or the fear of their withdrawal, make large contributions to party funds to stand in with the state and national committees and the machine, etc., etc. By these and other means they usually contrive to control nominations so as to put many men who are in railroad pay, or otherwise affected with a railroad interest, in the legislature or in office, and at the least they can generally prevent the nomination of men likely to be antagonistic to the railroads or too independent of them."

Where it is necessary the railroads do not hesitate to use money to buy the votes of legislators, either to secure the passage of measures favorable to the roads, or prevent the passage of measures likely to do them injury.

Railroad officers defend these practices as absolutely necessary under existing conditions. Said the president of a Western railroad:

We've got to control the legislatures or they will control us. Rates, service, investment, capitalization, terminal facilities, labor conditions, combination—everything in fact about the railroad business is subject to the legislative pull. If we control the legislature the pull is our way; if not, it is likely to be the other way. In any session of Congress or the legislature of any state in which our lines are located, a bill may be introduced that threatens our business in some way. It may be a bill in the interest of a rival system, giving them an advantage that will mean great gain for them and great loss perhaps for us. Or it may be a bill to fix rates, or subject us to inconvenient surveillance, or abolish grade crossings, or compel us to put in automatic appliances, couplers, switches, etc., or some other scheme that will cost us a lot of money. Or the bill may be simply some d— grafter's bid for blackmail under cover of an apparent public purpose, introduced by some scamp member on purpose to be bought off. We've got to be ready to defend ourselves along the whole line. We must be able to stop adverse bills and put our own bills through. And to do this at reasonable cost is often very difficult, for the grafters have got us used to lumps of railroad money that they won't vote for a railroad bill without the dough, even when we show them that the act is in perfect harmony with the public interest. The only thing for us to do is to put some more money in a legislative investment to protect our railroad investment and keep it in our control.

7. RATE-MAKING

How to make rates that will be both just and practical is one of the most difficult questions that can confront a railroad management. Our railroads as a rule act on the principle of charging all that the traffic will bear, while the public railroads of Europe and Australasia act in general on the principle of making the lowest rates that will yield a reasonable margin above expenses. The accompanying table shows the average rates in various public and private systems:

AVERAGE TON-MILE AND PASSENGER-MILE RATES
IN CENTS

| COUNTRY | Average ton- mile rate | Average freight haul | Average pas- senger rate | Average pas- senger haul |
|--------------------------------|---------------------------------|----------------------------|-----------------------------------|-----------------------------------|
| United States (private)..... | .78 | 244 | 2.03 | 30 |
| Germany (state)..... | 1.40 | 78 | 1.2 | 15 |
| Austria-Hungary (mostly state) | 1.50 | 65 | 1. | 25 |
| Belgium (state)..... | 1.25 | 45 | .75 | 14 |
| Switzerland (state)..... | 2.56 | 43 | 1.3 | 13 |
| France (private)..... | 1.55 | 102 | 1.34 | 21 |
| Great Britain (private)..... | 2.50 | | 2.25 | 12 |
| Norway (state)..... | 2. | | 1.16 | .. |
| Norway (private)..... | 2.6 | | 1.16 | .. |
| Denmark (state)..... | 1.44 | | .76 | .. |

The average ton-mile rate in the U. S. is lower than anywhere else in the world. But under this general average freight rate of our railways lie hidden many things which deprive it of all right to be used in comparison with European rates. There are many personal and unjust discriminations which bring down the average, and low rates between competitive points, with very high rates between local points, in many cases almost as high as the rates in the old stage-coach days—rates just low enough to keep business from being done by team instead of the railway.

German railway commissioners recently in this country, after studying our rates declared that they were in many cases four or five times as high as the German rates on the same goods for the same distances. This conclusion was based on specific comparison of the published rates, and did not take into account any rebates or concessions which so seriously affect average rates. The researches of the German commissioners lead to some comparisons of German and American rates that may be of interest here.

The average passenger rate in Prussia is .98 of a cent per mile, against 2.02 cents in the U. S. The average merchandise rate in Prussia is 1.36 cents per ton-mile, against .78 of a cent in this country. But the American rate does not include express, which pays very high rates, while the German rate does include express. It also includes large amounts of traffic which in this country is handled by fast freight and private car lines, the earnings of which are not included in the reported railroad revenues. The American rate is cut down by including large amounts of freight carried for the companies themselves, for which no charge is made, while the German figure includes only freight actually paid for. The German roads carry an immense amount of mail and packages for the parcels post, for which they get no pay, while American roads receive large sums for carrying the mails, and the packages for the most part go by express with us. The proportion of bulky, heavy, low-rate freight, such as coal, iron, ore, timber, etc., is very much larger here (where coal alone constitutes one third of the total tonnage) than in Europe, where the bulk of such traffic is carried by water. The average haul in Germany is seventy-eight miles, against 244 miles in the U. S., over three times the German haul, and this cuts down the average mile rate tremendously, so that on two roads run with equal efficiency and charging the same rates for equal service involving the same amount of labor and capital the road with the long average haul will show a much lower ton-mile rate. Our low ton-mile rate is partly due to carriage on circuitous routes and other unnecessary competitive transportation representing a waste of industrial force. And worse yet, our average tells the story of the special rates and secret concessions to favored shippers. Our ton-mile rate does not represent the rates the public has to pay, but is brought below the actual public rate level by the rebates and concessions granted the trusts and combines and other big shippers. The German average represents the rates that all the people pay.

Making allowance for express and mail, company freight and private car line traffic, the German commissioners conclude that a proper figure for our average freight rate would be 1.44 cents per ton-mile, while the figure for the Prussian roads would be .95 of a cent. It may be that the pendulum has gone a little beyond the vertical and that this comparison is a little more than fair to Prussia, but the evidence indicates that it is much nearer the truth than the ordinary comparison our railroad people are so fond of making, that ignores all the differences in respect to express, company freight, etc. If we could accurately allow for the freight carried by our roads at rates below the published tariffs in violation of law, it is quite probable that the contrast would be much stronger in favor of Prussia than the figures just quoted indicate.

The tendency both in public and private railway systems is more and more toward the equalization of rates over considerable areas and zones. If these zones continue to expand as they have in the past two decades, it would seem that we may ultimately have a system of practically uniform rates on each commodity throughout the country, with little or no regard for distance. Already blanket rates are made from the Pacific coast to all points east of the Missouri River, and from Eastern markets to all points in larger areas of the West and South. No such post-office system

of charges can be immediately established without violent dislocation of the values of real estate in different parts of the country, and wide-spread ruin to industries brought into competition on equal transportation terms with rival industries in other parts of the country possessing marked advantages in respect to wages, cost of coal, materials, etc. At the same time it must be recognized that equalization is the only solution of the rate-making problem so far proposed which avoids in any large degree the fundamental difficulty of leaving to the judgment of individuals or boards the fixing of the relative advantages of different cities, states, and regions in reference to distance and cost of transportation.

8. SAFETY

The following table shows the proportion of passengers killed and injured to the total number carried, and the proportion of employees killed and injured to the total number employed in different countries as given in the reports for 1902-4:

| COUNTRY | PASSENGERS | | EMPLOYEES | |
|----------------------------------|-----------------|------------------|-----------------|------------------|
| | Killed, 1 in | Injured, 1 in | Killed, 1 in | Injured, 1 in |
| United States ¹ | 1,957,441 | 84,424 | 364 | 22 |
| Great Britain ² | 8,073,000 | 445,000 | 736 | 88 |
| Germany..... | 11,701,354 | 2,113,471 | 1,199 | 451 |
| Belgium ³ | 33,151,173 | 431,937 | 2,266 | 98 |
| Austria-Hungary... | 9,432,303 | 1,328,551 | 1,908 | 363 |
| France..... | 5,260,000 | 1,052,000 | 954 | 355 |
| Switzerland..... | 12,237,515 | 849,820 | 1,070 | 42 |
| Denmark..... | 18,935,151 | 9,467,000 | | |
| Norway..... | 7,690,000 | 4,350,000 | | |
| Sweden..... | 6,667,000 | 3,450,000 | | |
| Russia..... | 1,080,000 | 250,000 | | |
| Spain..... | 2,000,000 | 308,000 | | |
| Canada..... | 1,120,000 | 158,000 | | |
| Victoria..... | 20,000,000 | 208,000 | | |
| Tasmania..... | | 271,000 | | |
| New South Wales... | 5,000,000 | 589,000 | | |
| South Australia.... | 6,667,000 | 2,500,000 | | |

¹ The returns of accidents in the U. S. are confessedly incomplete, while those of the other countries given are unquestionably correct. A complete report of accidents in this country would make all our comparisons even less favorable to our railway management.

² The 618,000 holders of annual tickets are not included. Estimated on the same basis as are the commuters in this country these would make a showing about 35 per cent better for Great Britain's treatment of passengers.

³ Drunks and suicides eliminated. The Belgian management keeps a strict account of these, but not all other management do.

The figures vary from year to year. For example, Denmark's railways killed no passengers in 1903-4, but did kill one for 1904-5. Tasmania killed none in 1903 and Victoria only 1 to 20,000,000 journeys.

It appears from these figures that railway travel is safest in Denmark, Norway, Sweden, Belgium, Germany, Switzerland, Austria-Hungary, and Australia; that it is more dangerous in Great Britain than in any of the above-named countries, and that in the U. S. it is most dangerous of all; about six times as dangerous as in Germany, seventeen times as dangerous as in Belgium, three times as dangerous as in France, and four times as dangerous as in Britain. In the U. S. and Great Britain the railways are owned and operated by private companies. In France the roads are mostly operated by private companies under a high degree of government control, and a good degree of safety is secured, but it is an interesting fact that it is four times as safe to ride on the railroads operated by the government in France as it is on the French railroads operated by the companies under government control.¹ In the other countries named they are owned and operated by the government. Belgium, Austria-Hungary, Germany, and Switzerland killed considerably smaller proportions of their employees than did France, Great Britain, and U. S. France and England have secured their safety at the cost of a rigid government control over the operation of the private railways, which has in large part taken the life and spirit out of the railways at the same time that it has

checked their tendency to disregard safety and avoid the expense required to secure it. In the U. S. the control by the law is not effective, and we see the real tendency of private ownership of railways in relation to safety—the tendency to look first, last, and all the time at the cost, and avoid the expenditure necessary to abolish grade crossings, etc., if they think it will be cheaper to pay damages. In Belgium and Germany the operation of the railways by the State permits the attainment of safety without the sacrifice of freedom, life, and progressiveness.

Our American data for 1904 and 1905 show even a worse state of affairs than the figures for 1903, which were used in the table as nearest the average data of the foreign facts. In 1904 we find: Passengers, 1 killed for every 1,622,267 carried, and 1 injured for every 78,523 carried; employees, 1 killed in every 357 and 1 in every 19 injured. In 1905 1 passenger was killed for every 1,375,856 carried, and 1 injured for every 70,655 carried; employees, 1 killed in every 411, and 1 injured in every 21; trainmen, 1 killed in 133, and 1 injured in every 9 employed. During the last three months of the year 1905 there were 2,077 collisions and 1,645 derailments on our American roads; 101 passengers were killed and 2,868 injured; 1,008 employees killed and 14,250 injured.

A passenger is about six times as likely to be killed in the U. S. as in Germany and twenty-five times as likely to be injured, while a railway employee is over three times as likely to be killed by our private railways and over twenty times as likely to be injured.

9. SERVICE

The best railway service in the world is to be found in the U. S. and in Germany. The New York Central and the Pennsylvania supply a service that in many ways the admiration of all observers. At the same time, the service on some of our Southern roads is as bad as can be found in any country that can lay claim to high rank in civilization and mechanical development.

In writing the above we have had in mind the speed and comfort of railway travel, but when we take all the elements of service into account, including safety and impartial treatment of shippers, the verdict may not be so clearly in our favor.

Good service requires safety, speed, promptitude, adequate facilities fairly distributed, convenient methods, and impartial treatment. In respect to the first and last items, which are the most vital of all, our railways are at the bottom of the list in a tabulation of the principal systems of the world. Even as to speed, while we have on a few special routes the fastest trains in existence, our average speed, according to high authority, does not compare favorably with averages from over the sea.¹

In respect to promptitude the German service is far ahead of ours. Careful selection and training of railway men and the premiums given for keeping schedule time have produced astonishing results. Even on our best systems there is far less regard for promptitude than in Germany, and on many of our railroads the delinquencies in time are as bad as they are in any country I have visited. Even in Italy, where it was a common thing for the principal trains to be three or four hours, or even half a day late, and to have an express train from Milan or Naples coming into Rome on time would cause more comment than if it came in one to three hours late as usual—even these exasperating derelictions, so common in Italy before the government took the railway management, are no worse than the conditions which exist on some of our Southern routes. Even such important trains as those that run from Florida to Washington are frequently several hours late, and sometimes passengers are delayed twelve and even twenty-four hours on the way.

¹ Franklin B. Locke, in the *Century Magazine*, May, 1898, p. 105; Theodore Voorhees, general superintendent, New York Central & Hudson River Railroad, in *The Independent*, Oct. 6, 1892.

¹ "Industrial Commission," vol. ix., p. 154.

Inadequacy of facilities at times of such need is another count in the indictment of our transportation service, private railways preferring to risk some loss to shippers and themselves rather than to invest in equipments large enough to fully meet the demands of periods of such pressure and unusual rush.

In 1905 over half a million dollars' worth of strawberries rotted in North Carolina because of the failure of the railroads and the Armour Refrigerator Company to furnish a sufficient number of cars. A report from Chadbourne, N. C., March 7th, says: "More than \$200,000 worth of strawberries have rotted at the depot here since Monday morning. The railroad company is hauling car-load after car-load of spoiled berries to the river and dumping them like so much garbage. The loss to the truck-growers of this immediate section, according to figures said to be reliable, will be at least \$600,000."

In its "Twentieth Annual Report," dated Dec. 19, 1906, the Interstate Commission says:

The inability of shippers to procure cars for the movement of their traffic is the subject of numerous and grievous complaints, which come to the commission from all parts of the country. A car famine prevails which brings distress in almost every section, and in some localities amounts to a calamity. The extraordinary prosperity which everywhere abounds, with the high prices obtainable for all classes of commodities, have so stimulated production as to yield a volume of transportation business which far exceeds in the aggregate the carrying capacity of the railroads. In a word, the development of private industry has of late been much more rapid than the increase of railway equipment. The conditions now existing in the Northwest, where large quantities of grain require immediate shipment, and in the Southwest and trans-Missouri region, where thousands and tens of thousands of live animals are denied movement to the consuming markets, may justly be regarded as alarming, while throughout the middle West and Atlantic seaboard the shortage of cars for manufactured articles and miscellaneous merchandise has become a matter of serious concern. In some cases it is simply a lack of cars, in others insufficient tracks and motive power, in still others wholly inadequate freight yards and terminal facilities.

Private railway service is also subject to interruptions and even practical annihilation for days and even weeks or months at a time in consequence of strikes and lockouts—difficulties which almost never occur on public railways and are quickly remedied when they do occur.

Our railway methods are in some important respects far less convenient than those in use in Europe. We pride ourselves on our baggage check system, but European travelers complain that our baggage system is far less convenient than theirs. At the International Railway Congress, held in Washington, May, 1905, vigorous objections were raised by many prominent delegates to our methods of handling baggage. They declared that in Europe the baggage is collected and delivered by the railways, or is taken with the passenger by means of cabs and porters, etc., and carried either in the same car with him or in the baggage-car on the same train, and is delivered at the hotel or residence at the same time the passenger arrives at destination, or very soon after; whereas in this country the traveler has to secure the services of some separate transportation company or pay excessive rates for express, and in any case is liable to have the delivery of his baggage delayed for two or three hours or more after his arrival, depriving him, perhaps, of the opportunity to change his clothing, and keeping the ladies of the party from making their accustomed toilets for the evening, etc., etc.

We have no cheap trains for working men such as those which carry working people in and out of

the large cities in Germany and England, for example, for twenty-five and fifty cents a week. We have no such cheap excursions and admirable tourist arrangements as they have in Switzerland, Germany, Belgium, and New Zealand; no concessions to school children such as State railways in some countries make; no special rates for libraries or for the development of agriculture. The special rates our railways make go to the Beef Trust and the Standard Oil.

10. EMPLOYEES

One of the most emphatic differences between public and private railway managements is to be found in the treatment of employees. Our railways pay the lower classes of railroad men very poorly, while the upper classes of officials are paid extravagant sums. The pay on the public systems is much more equal. The overworking of employees as to time is a still more serious complaint against the private roads. Many cases are on record in this country and Great Britain in which engineers, firemen, switchmen, telegraph operators, and other employees have been kept on duty continuously from sixteen to twenty-four hours, and in a few cases thirty-six to forty hours and even forty-eight hours without intermission for meals or rest.¹

In Prussia the law requires that the daily average of the hours of labor of station agents and assistants, telegraphers, switching foremen, overseers of stopping-places, and switchmen shall not exceed 8 hours, and the duration of a single task shall in no case exceed 10 hours. The average for trainmen is limited to 11 hours with 14 and 16 hours fixt as emergency limits. Engineers and firemen must not average more than 10 hours, and may never under any circumstances be on duty for more than 11 consecutive hours. Every employee must be given at least 2 rest-days per month, and trainmen must be permitted to rest at their homes not less than 10 consecutive hours daily.

Our railways exercise much less care for the safety of employees than is exercised by the European railways. It is six times as dangerous to work on American railroads as it is to work on the Belgian State railways. The danger to the lives of our railway employees is over 100 per cent greater than to those of Great Britain. The railway employees of France and Switzerland have three chances of escape to the American's one, while the German and Austrian systems are respectively 230 per cent and 420 per cent more merciful to their employees than our railways are.

Trade-unions among railway men are strongly encouraged by the best public systems, and vigorously opposed by private railroads. Public railways are much more considerate and equitable in their dealings with employees, and the best systems have definite provisions for the arbitration or impartial judicial decision of disputes between the workers and the authorities over them. Our railroads refuse to arbitrate. They buy their labor, like a commodity, at the lowest market price, just as they buy their coal and iron at competitive rates. They overwork their men, adjust their duties and their pay with little regard to equity, and exercise the power of arbitrary discharge; and if the workers strike in order to get justice or a fair consideration of their demands, the railroads use the injunction and the black list, and even the federal troops if need be, to enable them to retain their mastery, and persist in their refusal to give the men any voice in the control of

¹ See evidence collected on pp. 466-470 of "The Railways, the Trusts, and the People." Equity Series, 1520 Chestnut Street, Philadelphia.

the great industry into which they put their lives, or even in most cases so much as an opportunity for frank and friendly discussion of grievances.

The opposition to trade-unions and the primitive methods or absence of any reasonable methods for the settlement of grievances, are among the most important criticisms to be made upon our railways in behalf of labor. German railway employees are carefully selected with reference to their fitness for the work they are to do, and they are secure in their employment so long as they do their work well.

IV. Remedies Proposed

(1) **Pooling.**—The legalization of pooling has been advocated by many railroad managers as a cure for discrimination and the wastes of competition.

It is the favorite railroad remedy. "Give us liberty of contract, let us combine," say the railroads, "and the abuses you complain of will disappear." The public, however, is afraid that if railways are allowed to pool they will "combine to keep rates up, and the benefits of competition will be lost." Railroads do combine to keep rates up anyway. Competition in rates is spasmodic and abortive. The steady competition that insures fair play in the buying and selling of commodities in the open market has proved impossible of attainment in transportation, because of the large monopoly element involved; and in case of combination, secret or open, mutual understanding cannot be prevented; so that the real question is, whether railways shall have a right to combine openly as well as in secret, and whether this right will accomplish what is claimed.

Railroad managers say that if pooling were lawful, the traffic associations could use the power of the courts to check rate-cutting, secret rebates, etc., on the part of roads that had agreed to maintain rates. They point to the fact that in one year, under the traffic agreements in force before the Interstate Act forbade pooling, 135,000 cases of misdescription of goods were detailed at three seaboard cities in the west-bound through freight alone; and they declare that if the prohibitions of statute and common law against pooling were removed, they could stop the discriminations that result from competition among the railroads.

This is probably true, and we believe that railways should have the right to combine. There is nothing in our law more foolish and futile than the attempt to protect the people from railroad extortion by fostering competition. It means a war of rates now and then disturbing business and values and doing more harm than good, with long stretches of high charges in between—charges that are all the higher often because of the wastes entailed by abortive competition for which the railroads make the people pay.

But grant all that can be said in favor of pooling; grant that the right to form working agreements accorded to the railroads by the law of England has not done harm, but good; still the chief question remains: Can pooling stop the abuses of our railway system? Clearly it cannot stop the legislative free pass nor the favoritism due to the ownership and control of railroads by oil kings, steel kings, and others, who unite railroad ownership with business interests in other lines. It cannot stop discrimination arising from any of the five causes that are independent of

competition. In the days before the Interstate Act when pooling was in full bloom it did not stop even the discriminations due to competition; for railroads gave rebates and concessions on the sly to increase their tonnage and so base a claim for a larger share of the pool. Pooling cannot make the railways honest or public-spirited. It cannot take the railways out of politics, nor prevent overcapitalization, nor secure reasonable rates or fair treatment of employees.

(2) **Consolidation.**—The union of the railways under one great company has been earnestly advocated by Mr. Cook; C. P. Huntington, president for many years of the Southern Pacific; Mr. G. H. Lewis, and many others. Consolidation would eliminate the wastes of competition and the discriminations due to competition, but would intensify enormously all the evils due to the monopoly element in the problem.

The power to charge excessive rates, to disturb the fair distribution of wealth, to control the destinies of individual cities and states, to build the fortunes of railroad owners and favored persons, to establish and perpetuate an aristocracy of wealth far beyond what has yet been inflicted upon us to control the government in corporate interest, and to defy law and conscience—the power to do all this would be multiplied a thousand-fold.

Even the plan of G. H. Lewis, which calls for limitation of the amount of stock to be owned or voted for by any one man or corporation, and for representatives of the United States on the board of directors of the consolidated company, along with the directors elected by the stockholders—even this would not change the aim from private profit to public service, nor prevent the use of the enormous power of the consolidated railroads for the upbuilding of private interests, unless the public representatives were numerous enough and strong enough to dominate the representatives of private capital, in which the plan would constitute a form of public ownership, with the capital provided by private individuals on interest-bearing securities. The history of the Pacific roads shows how much good it does to have government directors on the railroad boards where the public representatives are not in control. And the history of railroad frauds and evasions of law leaves no doubt that giant capitalists would find some way of overcoming the limitation of stock holdings. Every employee of the Standard Oil could hold railroad stock for Rockefeller, and every man in the Steel Trust could use his holding power in aid of Morgan. If you admit private capital to power it will dominate if possible. It is not satisfied with an equal partnership. The public interest is not safe unless it is dominant. The Lewis plan is the best attempt I know of to devise a balance scheme or partnership in which public and private interests should work in harmony. But there is strong reason to believe that the balance could not be kept; the company would gravitate to the Huntington idea—a railroad empire in private hands—or to the public-ownership system under a non-partizan board (to be discarded presently).

(3) **Regulation.**—For many years the states and the nation have been trying to regulate the railroads. It is easy to regulate railroad rates and service on paper, but experience shows that it is very difficult to transform the paper regulations into actual fact according either to their letter or their spirit.

In no state of the union has the government succeeded by regulative measures in abolishing unjust discrimination or securing fair rates or reasonable safety and convenience of service.

For twenty years the federal government has done its best to stamp out discrimination and regulate rates, but with little better success than has attended the efforts of the states. Discriminations have changed their form, and for brief periods now and then have been to a considerable extent discontinued, but no way has yet been discovered through regulative measures of securing equal treatment for all shippers under private railway management. So long as men who are owners or part owners of coal-mines, steel-works, packing-houses, oil-refineries, etc., are also large stockholders in railroad companies, the railway managers they help to employ and pay will under their instructions find ways of favoring their shipments above the shipments of their business competitors. Even a little favor in the distribution of cars or the speeding of transit would be enough to give them the market without any rebates or cash concessions whatever. It is easy to side-track for a few hours or days the goods of rival firms, or obstruct shipments by lack of promptitude in the delivery of the full number of cars necessary to transact the business of the said rival firms or companies, and no regulative power short of an omnipresent, all-pervading, and all-powerful commission could prevent the abuse of railroad power in this and other similar ways.

For half a century regulation has been tried in England and France with very indifferent success. Railroad history in all the regulative countries is one long story of struggle with railroad abuses, and entire failure to secure immunity from the most vital evils of private railway management.

Even President Roosevelt's vigorous measures embodied in the Hepburn Law can at best reach only a small part of the trouble.

No fixing of rates can stop the free-pass evil, or secret rebates, or fake commissions, or fictitious damages, or underbilling, or false description, or numerous other forms of favoritism. Such a regulative measure as the Hepburn bill does not touch at all nine tenths of the methods of discrimination. We have seen that between sixty and seventy different methods of unjust discrimination between persons and places are in use in our railway business to-day. The fixing of a maximum rate can prevent neither secret rate-cutting, nor favoritism in facilities and services, nor even open discrimination in the arrangement of classifications and in the adjustment of rates between different localities.

The fixing of rates cannot even secure reasonable charges in the matters to which the adjudications relate, for upon every reduction the railways can always withdraw sufficient accommodations to more than balance the slice taken off the rate, and they can retaliate by delays and persecutions that will sicken shippers of making complaints.

Real publicity is the thing that private monopoly fears more than anything else. It is the strongest weapon the people have under a régime of private monopoly. But the railroads can easily refrain from keeping any records of transactions contrary to law, as indeed they do already to a large extent. It is very difficult to secure full publicity when the man who does not

want publicity keeps the accounts and manages the business. Even if full and continuous publicity could be attained, however, it would not stop railway wrongdoing. Some of the worst abuses have been perfectly well known for many years—for example, the tariff arrangements which give the Standard Oil and the Beef Trust such generous advantages over their competitors; so with the free-pass system, stock-watering, stock-gambling, railroad control of elections and legislatures—all perfectly well known and exposed in detail in many cases. But what effect does it have upon railway morals? Practically none. And it is doubtful if we can expect to obtain a complete or radical reform so long as we neglect the tap-root of railroad immorality, which is the antagonism of interests between the owners and the public, united with the tremendous power that goes with the possession and management of these vast interests.

The president and the attorney-general are doing all they can to compel the railroads to obey the law, but the trusts are on the other side, in the dark, trying to compel the railroads to break the law, and using means infinitely more powerful than the fines imposed now and then by the law when a few of the tricks happen to come to light.

From the Hepburn report of 1879 to the Garfield report and the interstate investigations of 1906, we have had publicity in large masses, and the Standard Oil, the Beef Combine, the Sugar Trust, Grain Trust, Coal Trust, Steel Trust, etc., have grown meantime in spite of all the flash-lights and spasms of popular indignation. If publicity is to do much good it must be continuous as well as searching. And even then it is doubtful if the problem can be solved by any regulative measures. Our best railroad men do not believe it. James J. Hill, for example, says that discriminations cannot be stopped; and Stuyvesant Fish, ex-president of the Illinois Central and also of the American Railway Association, and one of the ablest and most conscientious of our railroad kings, said in answer to my question (in 1905) that he did not think any regulative measures could stop discrimination. "Tell me how to enforce the Ten Commandments," he said, "and I'll tell you how to stop discrimination."

The inherent difficulty of regulating this vital monopoly, which must of course be either regulated or owned by the public, has never been more clearly and forcefully stated than by the Massachusetts Railroad Commission in the early days when Charles Francis Adams was a member of the board.

"The final difficulty with all legislation of this class," said the commission, speaking particularly of rate regulation, "is its excessively dangerous and politically corrupting tendency. It forces the corporations, whether they will or will not, into the lobby of the legislature and the rooms of the committees and commissions; they are forced there for the protection of their interests, for the essence of the system is that certain persons, whether the legislature itself or officials designated by it, have devolved upon them the responsibility of establishing the revenues of property belonging to others. The commissioners have grave doubts as to the success of any effort which practically effects a separation between the ownership and its management."

(4) **Public Ownership.**—Some of the principal reasons that have been urged in favor of public ownership of railroads are as follows:

1. Public railways tend to the diffusion of wealth and power, while private railways tend to the concentration of wealth and power. It is the nature of monopoly in private hands to absorb an unfair proportion of the national wealth product. Not only do private roads absorb more than their share of wealth, but they tend to concentrate in few hands the control over vast properties, both in the railway world and throughout the field of industry; for the secret rates, rebates, and concessions granted to large shippers and favored persons build up trusts and combines and giant monopolies which disturb the fair diffusion of wealth in industries of every class. Public railways, on the other hand, do not enable any class to absorb an unjust share of national wealth, nor concentrate profit or control in few hands, nor build up private monopoly or an aristocracy of wealth and industrial dominion, either in the railroad field or outside of it.

2. Railroad experience throughout the world indicates that impartial treatment of shippers can only be secured under public operation. When left to themselves, private railway managements are honeycombed with favoritism, and even the strongest governments have been unable to exert sufficient regulative pressure to extinguish the effects of this innate tendency. Public railways naturally tend to the impartiality which public interest so emphatically demands.

3. Private railways tend to confine facilities to paying routes, building up big cities and neglecting country districts, which are left without a fair share of transportation facilities; while public systems, aiming at the good of the whole country rather than at profit, extend their lines more widely, and distribute their facilities with regard to need and ultimate benefit to the public as well as with regard to the present traffic.

4. Private railways constitute one of the chief causes of political corruption. The question of public ownership of railroads is at bottom a choice between government ownership of railroads and railroad ownership of the government. The extinguishment of private control over railways removes the chief cause of political corruption under democratic institutions. How inherent and persistent is the tendency of private railroads to fill the halls of legislation with their agents and lobbyists and to use every available means of dominating the government in their interest, will be apparent to any one who is familiar with the history of private roads in the U. S., England, France, Germany, Italy, and other countries. Just so far as private railways have been left free to show their true nature, that is, just so far as they have been permitted to be really private, they have manifested this fundamental characteristic, which expresses itself in the effort to control government in the private interest of the railways and their allies.

5. The history of railroads shows that private railways, by systematic favoritism, stock-watering, political influence, etc., etc., tend to separate success from merit; while public roads do not disturb the normal union between merit and success. So far as construction frauds, overcapitalization, manipulation of stock, perversion of accounts, and other methods of deceit and cunning enable men to capture wealth produced by others, so far is a premium put on fraud and cunning, while true labor is discounted and men are drawn away from honest industry and productive

effort to devote themselves to mere commercial conquest.

6. Public railways tend to make lower rates than private roads in the same country and under similar conditions otherwise than in respect to ownership. Public railways aim primarily at service, while private railways aim at profit, and the rate level which yields the highest profit is above the rate level that secures the largest service at a reasonable margin above the cost.

7. National ownership and operation of railroads under good political conditions would be able to secure large economies through the abolition of unnecessary offices and staffs, especially in the larger cities; the systematic use of the shortest routes; the curtailment of the overgrown salaries of the upper class of railroad officials; a saving in lobby and legislative funds, campaign expenses, litigation costs, excessive construction profits, etc.; the abolition of secret concessions to favored shippers, and the economies of consolidation under a single management in the public interest. C. P. Huntington, the former president of the Southern Pacific Railroad, estimated the railroad wastes in New York City alone at \$100,000,000 a year, and the total wastes incident to the private railroad system in this country amount to several hundreds of millions every year.

8. Private railways foster monopoly in manufactures and commerce, while public railways put all on an equal footing and tend to prevent and break down all kinds of industrial monopoly.

9. Public railroads are superior to private roads in respect to their social effects. Private railroads intensify the tendency of this age of aggregation to mass population in giant cities. Public roads tend to mollify and soften this tendency, and sometimes definitely oppose it. Big cities are the danger spots of modern civilization. We may fairly designate as railroad slums not only the slums that gather in the railroad districts of big cities, but all the slums of our cities, which exist in large measure because of a false railroad policy—a policy of making rates for private profit instead of the public good; a policy which intensifies instead of relieving the congestion of population modern industry tends to produce. When private railways do something to relieve congestion, as in the case of working men's trains, it is not a part of their own policy, not a result of private ownership of railways, but a result of the compulsory adoption of a policy natural to good business.

Inequalities of social condition are greatly aggravated by private railroads, while public roads as a rule maintain an even balance or else make a definite effort to help the needy and aid the beginnings of wealth.

Social Effects Our private roads give the wealthy every advantage. The common people pay for their own freight and for a great part of the freight carried for Armour, Rockefeller, Morgan, and other owners of "infant" industries. A large proportion of our millionaires and multimillionaires owe their fortunes to railroad methods and policies which are wholly foreign to public roads and would be impossible of adoption on any civilized governmental system.

10. Private railways buy labor at the lowest market rates just as they buy coal and iron. Public railways recognize that in dealing with labor they are dealing, not with a commodity to be purchased for the use of the railroads and con-

sumed in providing transportation, but with human beings who form a part of the very society for the use of which the railroads themselves exist—shareholders in the roads and members of the co-operative associations on behalf of which the government itself is acting. Private railroads as a rule see only the economic side, the dollar-and-cent, profit-and-loss side, of the labor question. Public managements see the human side, the ethical side, and the civilization side, as well as the economic side, and pay higher wages, work the men shorter hours, and provide better conditions than private roads in the same country. The humane and enlightened policy of public roads toward the working classes both in their relation to their own employees and to the working people in other occupations, is one of the chief titles of the public railroads to our respect and admiration.

11. The character product or type of manhood produced by public railways is superior to that produced by private railways. The elements of character that make for good citizenship and moral living—respect for law and justice, habits of honesty and fair dealing, love of country, habitual action with reference to public interest rather than for selfish private ends—are much more strongly favored by public railways than by private systems.

12. Railways are public highways and perform public functions. This is the doctrine of the U. S. Supreme Court, and the courts of last resort in New York, Massachusetts, Pennsylvania, Minnesota, and many other states. Public functions, services, rights, or properties should be used for the public benefit, not for private profit. It is the nature of private ownership and management to subordinate the public benefit to private profit wherever the two conflict. Therefore, public affairs, including the public highways, should not be entrusted to private management.

13. The construction and operation of railroads involve the exercise of the sovereign powers of taxation, eminent domain, and the determination of the distribution of wealth, and in many cases also the sovereign power of legislation. Only the sovereign people have a right to sovereign power; therefore only the people have a right to own and operate the highways with which the exercise of sovereign power is indissolubly linked. It is an economic blunder and an abuse of governmental powers to put in the hands of a small portion of the people to be managed by them for their profit and advantage sovereign powers and functions which belong to the whole people and should be used for the benefit of the whole people, and not for the interest of a part of the community against the rest. What could be more unwise than to hand over to a few individuals public rights and powers which enable them to tax the whole people for their own benefit?

14. Private monopoly of railroads involves a far larger case of taxation without representation than resulted from the efforts of King George and the English Parliament which precipitated the American Revolution.

The principal objections raised against public ownership and operation of railroads in this country relate to the cost, the sphere of government, and the political difficulties that would be encountered in this country.

If the government bought the railroads at their present capitalization, the cost would certainly be very large, but the wind and water may be squeezed out of railroad capitalization either by

exercise of the power to reduce rates, or by building or buying one or two competing routes. If progressive income and inheritance taxes were established, as advocated by President Roosevelt, the monopolists could be made to pay into the public treasury in a few years enough to pay for all the railroads the government would need to buy, above the structural cost of duplication less depreciation.

It is possible that, as pointed out by Senator Newlands, the most feasible plan, the one that could be adopted with the least opposition and the minimum of friction, would be to issue 3 per cent government bonds for the fair value of the securities of the railways taken for public use, and provide that the hundreds of millions saved each year by the difference between the 3 per cent or less at which the government can borrow and the rate of interest and dividends paid by the railroads, should be used to pay off the railway capital, which could be accomplished in this way probably in thirty or forty years.

Some excellent people declare that the railroad business is outside the proper sphere of government. It is to be regretted that the railroads do not regard the government business as outside the sphere of the railroads, but there is rather more logic in the inclusion of government in the railroad field than in the exclusion of the railroads from the government field. The clear, common sense of the situation is that the government is simply the agent of the people to attend to any business they see fit to entrust to it.

The fact is that in every civilized land the government has two functions, restraint and service. It keeps order and it performs services—exercises industrial activities. No government on earth is limited to keeping order. The sole questions in practical statesmanship relate to the extent of the two functions and the methods to be adopted. And the movement of history is in the direction of diminishing restraint and increasing service.

The political difficulties in the way of municipal ownership of railways in the U. S. at the present time are undoubtedly very great, if not prohibitive. But it must not be inferred that public railways are wrong for America because present political conditions are not adapted to that system. If public railways, honestly managed in the public interest, are better than private railways, then it is our duty to establish as rapidly as possible the political conditions necessary to secure honest management in the public interest. The elimination of private railway corporations will remove one of the chief causes, if not the chief cause, of political corruption in city, state, and nation; but it is equally clear that the operation of the railways by a ring of political monopolists and grafters in their private interest would be a disaster so great that public ownership cannot be asked or assented to by fair-minded citizens until there is a reasonable prospect of escaping this danger. There are important safeguards, however, that we can adopt and that will go far in assuring political purity.

Germany, Switzerland, Belgium, Denmark, New Zealand, and Australia have valuable lessons for us in this regard. From Germany we should take the thorough organization of the civil service based on technical training and careful testing, and the system of advisory railway councils representing various interests, industrial and social; from Switzerland, the initiative and referendum,

Objections Answered

that the people may have actual and continuous control of the government and graft become a lost art; from Belgium, proportional representation, that every important interest may be fairly represented and have a voice in the deliberations of our legislative bodies; from Denmark, the railway profit-sharing plan; from New Zealand, the railway appeal boards, high wages, short hours, and liberal pension system; from Australia, perhaps, a modified form of the bipartisan commission as a further means of checking any attempt at using the system for party purposes or political pressure to secure extensions or improvements on sectional lines; and back of it all we must have a sufficient development of civic interest and intelligence in the body of the people to make it certain that the laws would be enforced and that evasion of them would not be tolerated. The magnificent response our people have given to Roosevelt, Folk, La Follette, Johnson, Weaver, Fagan, and other civic heroes indicates that under proper leaders it would not take long to evolve either the laws or the enlightened public spirit needful to make public ownership of the railways a success.

In answer to the objection that government ownership would put the railroads in politics, we may ask: "Where are they now?" It is doubtful whether they could be in politics in any worse form than they are to-day, and it may be further remarked that it is not necessary that the railroads should be in politics at all in the objectionable sense, under a common-sense system of public ownership with a non-partizan commission, railway courts, and solid civil-service organization.

Prof. Richard T. Ely says: "Our American railroads are incomparably more 'in politics' than the German railroads. Not only this; those German railroads which have been bought by the State, I believe, are less 'in politics' than they were when they were private property.

"Our terrible corruption in cities dates from the rise of private corporations in control of natural monopolies, and when we abolish them we do away with the chief cause of corruption."

As high as 20 per cent of the railroads of the U. S. have been operated at the same time by government agents called receivers, and the success and honesty with which these public managers, responsible to the federal courts, performed the duties of their calling under infinite difficulties, bringing the roads back to prosperity after they had been wrecked by private enterprise, shows the possibilities of public management of railroads under reasonable safeguards.

Political influence in rate-making and in the establishment of new lines, abuse of patronage, and use of the railroads for party purposes, are possibilities that have to be guarded against in the case of public railways. And the railroad lobby, caucuses and conventions packed with railroad adherents, use of the railroad vote for private corporation purposes, election of men really representing the railways and their allies under the mask and pretense of representing the people, direct and indirect bribery of legislators and officials, use of the power of discrimination and favoritism and the fear of reprisals to swing influential shippers into line and compel them to use their influence with legislators and the government for railroad purposes, secret contamination of the sources of public information, perversion of the press and manufacture of erroneous public sentiment by fraudulent methods—all these and

many other means of corrupting and controlling government in the interest of the railways and their allies, must be guarded against under the private system.

A few of the important differences are as follows:

1. Under the private system the railways themselves are the active cause of political corruption, while under the public system the railways are not the active cause, but merely the field of operation. If there is corruption under the public system it is because the government is bad. The railways enlarge the field, and if a government is tainted with the virus of the spoils system or the poison of excessive partizanship or political rottenness of any sort, it will manifest itself in the railways as well as in the halls of legislation, the ordinary administrative departments, and even the courts, if the canker goes deep enough. But given a good government and public railways, the public railways will not go to work to corrupt the government. Given a good government and private railways, and the private railways will go to work to corrupt the government and control it in their interest, and the government must be very, very good and very, very strong or they will succeed in large measure, except in times of popular uprising, and even then they have far more than an even chance of molding, dominating, or defying the law.

2. The political evils that may attend public railways under a bad government are much less vital than those created by private railways.

The former affect chiefly the cost of running the roads and the government, the latter undermine the very nature of free institutions, overturn popular government, and establish

a corporate aristocracy in place of a republic. Governor Folk's splendid battle-cry in Missouri is that the domination of our governments by the railroads and their allies through bribery and fraud is treason. A legislator who holds allegiance to a railway or other private interest and votes for it against the public is giving aid and comfort to the enemies of the republic. The federal constitution guarantees to every state a republican form of government. The railways and their allies defy this provision as they do many other constitutional and statutory enactments, and transform our state and national governments from governments by and for the people to governments by and for the corporations wherever corporate interests are involved.

3. The political ills of public railways are open, clearly visible, known of all men, while the political evils arising from private railways are largely hidden from the public view.

4. The political ills of public railways are more easily removed than those of private railroads, not only because they are less hidden and less radical, but because under the private system a large mass of wealthy and influential people, as shareholders in private railways or recipients of their favors, have a financial interest in aiding or permitting the election of men who can be controlled by the railroads, while under the public system the financial interest of these important classes is transferred to the side of good citizenship and they stand with the great body of the people for honest and efficient administration.

5. Finally, public roads are to-day in nearly all civilized countries substantially free from any serious form of political difficulty. In a number

Political Evils

of countries no serious political trouble has ever been experienced in connection with the State railways, and in others where difficulty has been experienced it has in nearly every case been wholly or almost wholly overcome.

AMERICAN RAILWAYS VS. THE PUBLIC

[American railway corporations finding themselves growing unpopular, because of their watered stock, discriminations, carelessness of human life, etc., have raised the cry of persecution and have organized "literary bureaus" to prepare free articles for the magazines and daily press, to try and defend themselves before the public and show how the railways have been abused. We give below one of these railway statements, prepared in 1903 for submission to the Senate Committee on Interstate Commerce, by Slason Thompson, secretary of the General Managers' Association, representing twenty-four railroads in Chicago. We give it in the railways' own words, side by side with what we believe to be the facts upon each point.—ED.]

THE RAILWAYS' OWN STATEMENT

(a) Freight Rates

That freight rates on American railways are the lowest in the world, and had steadily tended downward until the recent advance in wages and material, is proved by the following statements:

| Average revenue per ton per mile | | | | Pay of trackmen | |
|----------------------------------|-------------|----------|-------------|-----------------|----------------|
| Year | Rate, cents | Year | Rate, cents | Year | Wages, per day |
| 1870.... | 1.990 | 1895.... | .839 | 1895.... | \$1.17 |
| 1882.... | 1.240 | 1896.... | .806 | 1896.... | 1.17 |
| 1887.... | 1.030 | 1897.... | .798 | 1897.... | 1.16 |
| 1888.... | 1.001 | 1898.... | .753 | 1898.... | 1.16 |
| 1889.... | .922 | 1899.... | .744 | 1899.... | 1.18 |
| 1890.... | .941 | 1900.... | .729 | 1900.... | 1.22 |
| 1891.... | .895 | 1901.... | .730 | 1901.... | 1.23 |
| 1892.... | .898 | 1902.... | .737 | 1902.... | 1.25 |
| 1893.... | .879 | 1903.... | .763 | 1903.... | 1.31 |
| 1894.... | .860 | | | | |

It costs twenty-five cents a mile to move a ton of freight from the farm or the factory to the station; it costs less than three fourths of a cent a mile to transport it thence to its destination.

(b) Passenger Rates

The average revenue of the railways for carrying passengers one mile since the organization of the Interstate Commerce Commission has been as follows:

| Cents | | Cents | | Cents | |
|-----------|------|-----------|------|-----------|------|
| 1888..... | 2.35 | 1893..... | 2.11 | 1898..... | 1.97 |
| 1889..... | 2.17 | 1894..... | 1.99 | 1899..... | 1.98 |
| 1890..... | 2.17 | 1895..... | 2.04 | 1900..... | 2.00 |
| 1891..... | 2.14 | 1896..... | 2.02 | 1901..... | 2.01 |
| 1892..... | 2.13 | 1897..... | 2.02 | 1902..... | 1.99 |
| | | | | 1903..... | 2.01 |

Where passenger rates have declined nearly 6 per cent since 1892 the average daily wages of the men most directly employed in train service have increased as follows:

| | P. C. | | P. C. |
|----------------|-------|---------------------|-------|
| Enginemen..... | 9 | Conductors..... | 10 |
| Firemen..... | 10 | Other trainmen..... | 14 |

A STATEMENT OF THE PUBLIC'S INTEREST

(a) Freight Rates

It is not proved that American freight rates are the cheapest. Many elements have to be taken into consideration which the railroads' statement conveniently omits. In Great Britain, taking the railroads' own figures, the published rates include charges for collection and delivery, loading and unloading, and, to a large extent, also insurance. According to the railroads' own statement, the corresponding expenses in America are very high, yet are not included in American rates. President A. T. Hadley of Yale (by no means a believer in public ownership) says distinctly (in his "American Transportation") that it is impossible to compare English and American freight rates. As for rates in other countries, some classes of rates are undoubtedly higher, but some classes of rates are also lower than in America. It must be remembered, too, that such rates are general averages, and, in case of America especially, are largely made up of long-haul rates for grain, coal, iron, and the cheapest classes of freight. Such rates are cheaper than in continental Europe. But when it comes to short-distance rates for general commodities, and especially between non-competing points, American rates tell a very different story. German commissioners recently in the U. S. estimated that for small shippers rates in Germany and the U. S. were about the same. American rates are low for the few big shippers. European rates, especially on the government-owned lines, serve the general public.

(b) Passenger Rates

Here comparison is more fair, and here we find that for the average traveler, American passenger rates are probably the highest of the civilized world. This is not true for the few rich. Rich people in America can travel cheaper than in Europe; European first-class rates are high. They believe in Europe that if rich people want special comforts they should pay for them. But the true comparison is between rates for the ordinary public. This means in Europe third class.

THE RAILWAYS' OWN STATEMENT

The recent increase in receipts per passenger mile is due to losing the cheapest passenger traffic, which is traveling by trolley, and not to an increase in rates.

The cost of passenger service is constantly increasing to meet the demand for more trains and greater speed.

(c) Foreign Passenger Rates

In England, the North Eastern Railway, the only British road giving intelligible statistics, shows the following average receipts per ton mile in 1903:

| | |
|---|------------|
| On minerals..... | 1.93 cents |
| On merchandise and live stock..... | 2.94 cents |
| On all commodities..... | 2.32 cents |
| Pennsylvania Railroad on much the same class..... | 0.58 cents |
| In Germany, average revenue per ton mile..... | 1.42 cents |
| In France, average revenue per ton mile..... | 1.55 cents |
| In Austria, average revenue per ton mile..... | 1.16 cents |
| In Hungary, average revenue per ton mile..... | 1.30 cents |

England—First class, 4 cents; second, 2.5 cents; third, 2 cents. Average receipts per passenger mile, about 2 cents.

Germany—Fast trains: First class, 3.45 cents; second, 2.55; third, 1.79. Ordinary trains: First, 3.06 cents; second, 2.3; third, 1.53, and fourth, 0.77 (not allowed on fast trains). Average receipts per passenger mile, about 1.07 cents, due to 90 per cent of travel being third and fourth class, on cars little better than American box cars.

If the American railway freight rates were in proportion to American wages in comparison with foreign wages, they would be from four to eight times what they are, as the following figures, from official sources, prove:

(d) Pay of Railway Labor

Average pay of railway laborers in various countries whose freight rates are more than double American rates:

| | Per day |
|----------------------------------|---------|
| United States ¹ | \$1.31 |
| United Kingdom..... | .71 |
| Germany (State railways)..... | .57 |
| France (State railways)..... | .52 |
| Belgium (State railways)..... | .48 |
| Italy (State railways)..... | .42 |
| Russia (State railways)..... | .29 |
| India (State railways)..... | .08 |

¹ The lowest paid class of railway employees.

Average pay of several classes of railway employees in the U. S., Great Britain, and Belgium, 1903:

| | United States, per day | Great Britain, per day | Belgium ¹ per day |
|---|---------------------------|---------------------------|---------------------------------|
| Enginemen..... | \$4.01 | \$1.62 | \$1.01 |
| Firemen..... | 2.28 | .91 | .72 |
| Conductors..... | 3.38 | 1.22 | 1.08 |
| Other trainmen..... | 2.17 | .85 | .72 |
| General office clerks..... | 2.21 | | 1.11 |
| Station agents..... | 1.87 | 1.01 | 1.38 |
| Machinists..... | 2.50 | 1.50 | .85 |
| Carpenters..... | 2.19 | 1.22 | .84 |
| Switch and crossing tenders and watchmen—Men..... | 1.76 | .91 | .48 |
| Women..... | | | .16 |

¹ Belgium is chosen for the comparison because the pay of railway labor there is less complicated with premiums and allowances than elsewhere on the Continent. See *Bulletin, Department of Labor, No. 20, and Fifteenth Annual Report of the Commissioner of Labor.*

A STATEMENT OF THE PUBLIC'S INTEREST

(c) Foreign Passenger Rates

In Great Britain, according to the railroads' own statement, the average receipts per passenger per mile is about two cents, and this, as the statement says, is the third-class rate, showing how most people travel. In Germany, again, as the railroads' own statement shows, 90 per cent of the people go third or even fourth class, and the average receipts per passenger mile are only scarcely one half the American rate, or 1.07 cents, compared with the American 2.01 cents. The railroads' statement tries to get around this by stating that the German third- and fourth-class cars are "little better than box cars." Are we to believe that 90 per cent of German travel goes in box cars? Either those who assert this are utterly ignorant of modern Germany, or are willing to deceive the American people. The writer has recently traveled in all parts of the German Empire, has tried all classes, and knows that German third-class cars are comfortable, well-lit cars, quite as clean and well-ventilated as many American ordinary cars. Ninety per cent of Germans do not go in "box cars." In Belgium and Denmark the average is 0.75; Austria, 1.00; Switzerland, 1.30; Norway and Sweden, 1.16. American rates (except on a very few roads) only average two cents by including commuters, etc. This can be seen from the fact that in most states the railroads consider themselves persecuted if asked to charge only two cents a mile. American railroads favor the rich, but charge 90 per cent of the people about double the European rates.

(d) Pay of Railway Labor

It is undoubtedly true that American railway labor is more highly paid than in Europe. American wages are higher than European wages in most pursuits. They are, however, not so much higher as at first appears, and especially as appears from the railroads' statement. It picks out Belgium for comparison on the Continent of Europe, perhaps because wages are generally lower in Belgium than in any European country except in the extreme east and south. When it was a question of low passenger rates, Belgium is not mentioned by American railroads. European wages generally are materially higher than in Belgium. It must be remembered too that wages are measured by the cost of living, and that the necessities of life, particularly rent, are much cheaper in Europe. In Europe, too, the governments almost always see to it that the men on the State railways have good houses at very cheap rates, old-age pensions, accident and sickness insurance, and many other advantages. This is particularly the case in Germany and Belgium. The German Government distributed in 1903 \$109,000,000 in various forms of insurance relief. The Prussian Railway Department alone in 1903 owned 8,860 houses for its employees, and besides loaned over \$1,000,000 to workmen's building societies. The little done by a few American roads out of dues paid by their employees is as nothing in comparison. There is more than one side to the question of wages. The Labor reports to which the railroads' statement refers for comparative wages are at least eight years old. Europe has made large progress in those years in its treatment of labor.

THE RAILWAYS' OWN STATEMENT

(e) Capitalisation

In 1903 the Interstate Commerce Commission summarized their capitalization thus:

| | |
|----------------------------|------------------|
| Stock..... | \$6,155,559,062 |
| Funded debt..... | 6,444,437,226 |
| Total railway capital..... | \$12,599,996,258 |
| Owned by railroads..... | 2,318,391,953 |
| Net railway capital..... | \$10,281,598,305 |

COST OF RAILWAYS AND EQUIPMENT

The Interstate Commerce Commission in 1903 reported as follows:

| | |
|-----------------------------------|------------------|
| Cost of road (193,823 miles)..... | \$10,273,837,190 |
| Cost of equipment..... | 1,699,767,723 |
| Total cost..... | \$10,973,504,903 |

¹ During the last four years new locomotives, passenger and freight cars cost upward of \$874,000,000.

It is the large cost of sidings, yard tracks, elevating tracks, and other facilities at terminals rather than the construction of new road that has caused recent additions to railway capital.

For twelve years—1888–99, inclusive—an average of 63.94 per cent of American railway stocks paid no dividends—the lowest amount paying being 29.83 per cent, in 1896, and the highest 40.61, in 1899. Not until 1901 did a majority of railway stocks pay any dividends whatever. Even last year 43.94 per cent paid nothing. During all these years the water in railway stock was gradually absorbed by millions diverted from stockholders to vast extensions, betterments, and improvements. On June 30, 1895, there were 37,855 miles of operated railways representing \$2,439,144,503 of capital, in the hands of the receivers. Before they got out, the water was effectually squeezed out of them. At last accounts there were only 1,185 miles under receivers' orders.

AMERICAN VERSUS FOREIGN CAPITALIZATION

The test of comparison with foreign railway capitalization furnishes the following demonstration:

| | Miles | Capitalization or cost of construction | Capitali- zation per mile |
|---------------------------|---------|--|---------------------------------|
| United Kingdom..... | 22,435 | \$6,225,144,585 | \$277.474 |
| Germany (State)..... | 132,125 | 3,364,290,000 | 104.725 |
| France (State)..... | 223,938 | 3,415,400,000 | 143.053 |
| Russia (State)..... | 135,482 | 2,700,000,000 | 76.995 |
| Austria (State)..... | 112,402 | 1,370,109,725 | 110.475 |
| Hungary (State)..... | 110,813 | 701,640,865 | 64.888 |
| Belgium (State)..... | 12,498 | 419,410,490 | 267.898 |
| Holland (State)..... | 1,064 | 145,885,000 | 137.103 |
| Switzerland (State)..... | 12,468 | 257,305,470 | 104.250 |
| Norway (State)..... | 1,274 | 59,175,000 | 39.384 |
| Sweden (State)..... | 12,416 | 106,419,875 | 44.048 |
| Denmark (State)..... | 1,112 | 46,800,000 | 41.900 |
| Total foreign railways.. | 148,027 | \$18,925,810,010 | \$127.696 |
| United States— | | | |
| Gross (1903)..... | 205,313 | \$12,599,996,258 | \$61.369 |
| Net (1903)..... | 205,313 | 10,281,598,305 | 50.077 |
| Cost of construction..... | 205,313 | 12,794,806,023 | 62.313 |

¹ Cost of construction.

NOTE.—Altho American railways are capitalized at less than one half foreign railways, they were constructed by labor costing from two to four times as much. (See WAGES IN DIFFERENT COUNTRIES.)

A STATEMENT OF THE PUBLIC'S INTEREST

(e) Capitalisation

The railways' statement argues that American railways are not overcapitalized because the United States capitalization averages only \$61,369 and foreign capitalization \$127,696 per mile. But the question is, *What is capitalized?* Large portions of the American railway mileage do not begin to compare with the construction of most European roads. England, for example, allows no grade crossings, compels the best safety devices, etc., while all European roads are supervised by governments which insist on many costly details. European roads are very much more watched than American roads. The result is that European roads are more costly but can attain higher speed and operate with more safety. As to speed, the writer has calculated the speed of the 30 fastest trains running 100 miles or over, leaving London, Paris, Berlin, and New York. (For details, see his tables in the *Review of Reviews* for Nov., 1907.) He finds that the 30 fastest trains leaving New York average 45.23 miles per hour; those leaving Berlin average 45.78 miles per hour; those leaving Paris average 47.49 miles per hour, and those leaving London attain the remarkable average of 52.86 per hour. In other words, American express trains, even when on time (and usually they are behind time), run on the average slower than those of England, France, or Germany. Even our boasted Twentieth Century Limited on the New York Central runs as far as Rochester (372 miles) only 52.76 miles per hour—not so fast as the average English express train. There were in the United Kingdom in the summer of 1907, including long and short runs, 61 trains whose schedule time was 56 miles per hour. Now such speed is only possible with the best track, a perfect system of signals, the latest improvements, and, above all, absence of grade crossings. Naturally this requires more capitalization than our cheaply constructed, poorly graded American roads. Before our railroads can say that they are not overcapitalized we must know how much actual money was paid in, and it is notorious that no railroads in the world have as much water in proportion to money actually paid in. For some details as to the stock-watering of American roads, see article RAILWAYS, p. 1038. See there, too, how the final report of the United States Industrial Commission found that the improvements, of which the railroads make so much, could account for \$120,000,000 in 1900, while in that year alone the railroads watered their stock \$457,000,000.

STOCK-WATERING

It is this stock-watering, with the resultant striving to earn money on a capital never paid in, that prevents the railroads from giving a satisfactory service, from introducing improvements, from making necessary provisions for human life; it is stock-watering, in a word, that makes the American railway system, once undoubtedly the best in the world, at present, on the important points of track construction, speed, and, above all, safety, distinctly below the systems of Great Britain, France, and Germany. Another important point is that in Europe generally the railroads have had to pay dearly for land. American railroads have bought land cheap and had a vast mileage given them for nothing.

THE RAILWAYS' OWN STATEMENT

(f) *Distribution of Railway Capital*

The boggy that railway ownership is being dangerously concentrated was refuted by the Report of the Interstate Commerce Commission, Feb. 24, 1905, "that the number of stockholders reported by the carriers in their annual reports for the year ending June 30, 1904, was 327,851." As the holding of railway bonds is even more general, owing to their character as approved securities in estates and trusteeships, the total of those directly interested in railway stocks and bonds must approach 700,000.

A still further distribution of interest in railway securities comes through the large holdings of trustees, administrators, and executors of estates; of bankers and brokers for long lists of customers, and of insurance companies, banks, savings-banks, and other corporations.

How great is this last distribution may be judged from the following statement of railway stocks and bonds held by various corporate bodies:

| | |
|---|-----------------|
| Insurance companies licensed in Massachusetts | \$845,889,038 |
| Savings-banks in six states..... | 442,354,086 |
| Security from educational institutions..... | 47,408,327 |
| Total..... | \$1,335,711,451 |

An illustration of these holdings of railway securities is afforded by the reports of the following companies:

| | |
|--|---------------|
| New York Life Insurance Company (bonds)... | \$207,334,800 |
| Mutual Life Insurance Company (bonds)..... | 94,982,000 |
| Mutual Life Insurance Company (stocks)..... | 18,860,000 |
| Prudential Life Insurance Company (bonds)... | 25,977,230 |
| Travelers' Insurance Company (stocks and bonds)..... | 21,823,000 |

The fire risks in force in the U. S. amount to over \$27,000,000,000. More than half the assets of the companies writing this insurance is invested in railway securities.

The significance of these figures is emphasized by the further fact that in the whole U. S. there are over 17,000,000 life-insurance policies in force, covering \$10,508,478,776, and 7,305,228 depositors in savings-banks, whose deposits aggregate \$2,935,204,845. These millions are all indirectly interested in the present conservative and progressive management of American railways.

(g) *As to Discrimination*

As for rebates, private-car lines, industrial tracks, and terminal privileges or any other device whereby unjust discriminations are given, the present laws, if enforced, would seem to be sufficient to put a stop to them. If they are not, Congress should immediately strengthen the hands of the Interstate Commerce Commission for the detection and prosecution of the offenders. Because there are black sheep in railway circles, it is not a "square deal" to hamstring this most complex and vital of American industries. A wise surgeon would not attempt to cure a man who squints by cutting off his legs. What legs are to a man, rates are to the railways. None of the railway abuses of which the people complain is going to be cured by substituting mile-posts for brains in the adjustment of rates.

A STATEMENT OF THE PUBLIC'S INTEREST

(f) *Concentration of Capital*

The railways' statement considers the danger of concentration in railway ownership a "boggy" idea. The reason it gives for this assertion is the distribution of railway shares. But the point is not who owns the railway shares and bonds, but *who controls them*. This is the real danger and this is not a "boggy" idea. The tendency to combination of control is the patent railway fact of the U. S. There have been 5,000 railway companies in the U. S.; there are now only between 800 and 900 reported as independent by the Interstate Commerce Commission. Of these, six giant systems control 90 per cent of the vital railway mileage of the country, and even these six systems have their combinations, with their common holdings overlapping ownership of shares, interrelations of directors, etc. A member of the Interstate Commerce Commission (see article RAILWAYS) is quoted as saying that half a dozen men can meet and practically control the transportation rates of the U. S. Is this no danger? Is it not notorious that railway corporations have largely controlled legislatures of states as widely apart as New Hampshire, Connecticut, New Jersey, Pennsylvania, California, and indeed most of the states of the union? Is it not the plain truth that these gigantic railway corporations exert more power than most states and that they have their representatives and senators in Congress more truly than have the people of the states? As far back as 1871 Charles Francis Adams, himself a railway president, wrote ("Chapters on Erie"):

The belief is common in America that the day is at hand when corporations far greater than ever—swaying such power as has never in the world's history been trusted in the hands of mere private citizens, controlled by single men, like Vanderbilt, or by combinations of men, like Fisk, Gould, and Sage—after having created a system of quiet but irrepressible corruption, will ultimately succeed in directing government itself.

Later a writer so favorable to America as Mr. Bryce comes to the conclusion (in his "American Commonwealth") that all congressional legislation affecting corporations is systematically managed or at least influenced by corruption. The railroads can no longer lull the American people by calling this fear "boggy." A steadily increasing number of people see that the government must either control the railroads (as in Europe), or the railroads control government, as they do for the most part in the U. S.

(g) *As to Discrimination*

To this important subject, which is filling to-day the minds and ears of the people, which is in all the papers, and getting into the courts and legislatures, the railways' statement devotes a paragraph. It goes into no details, but says that abuses are not "to be cured by substituting mile-posts for brains in the adjustment of rates." The railroads misunderstand the public. No man asks such substitution. What the American people ask and mean to have is the substitution of honest service of the public's needs in fixing rates, to a dishonest subserviency to the interests of interallied corporations.

THE RAILWAYS' OWN STATEMENT

(h) Railway Accidents

As invidious comparisons are often made between the accidents on American and British railways, the following facts should have a corrective effect:

| | Passengers carried one mile | Freight tons carried one mile |
|------------------------|-----------------------------|-------------------------------|
| British railways..... | 9,660,000,000 | 15,572,000,000 |
| American railways..... | 20,915,763,881 | 173,221,278,993 |

PROPORTION KILLED TO PASSENGERS CARRIED ONE MILE

| | |
|--------------------|-----------------|
| Great Britain..... | 1 in 61,923,000 |
| United States..... | 1 in 65,168,143 |

The following tables show the proportion of fatalities to traffic in Europe and the U. S.:

| | Europe ¹ | United States |
|--|---------------------|-----------------|
| Passengers carried one mile | 44,080,000,000 | 20,915,763,881 |
| Passengers killed per billion carried one mile..... | 12.16 | 15.35 |
| Freight tons carried one mile | 76,209,092,720 | 173,221,278,993 |
| Employees killed per billion tons carried one mile.... | 29.65 | 18.66 |

¹ Including United Kingdom.

Relatively to passenger and freight traffic, fatalities to passengers and employees are less on American than foreign railways, as the following table shows:

| YEAR | COUNTRY | Mileage | Passengers killed | Employees killed |
|--------|---------------------|---------|-------------------|------------------|
| 1901 | Russian Europe..... | 28,982 | 93 | 458 |
| 1902-3 | Norway..... | 1,430 | 1 | 4 |
| 1902 | Sweden..... | 7,421 | 6 | 21 |
| 1902-3 | Denmark..... | 1,879 | | 27 |
| 1903 | Germany..... | 34,014 | 73 | 505 |
| 1902 | Holland..... | 2,023 | 3 | 23 |
| 1902 | Belgium..... | 2,827 | 6 | 36 |
| 1900 | France..... | 23,938 | 194 | 314 |
| 1903 | Switzerland..... | 2,469 | 5 | 28 |
| 1896 | Spain..... | 7,994 | 19 | 31 |
| 1900 | Italy..... | 9,879 | 33 | 63 |
| 1902 | Austria..... | 12,402 | 11 | 87 |
| 1902 | Hungary..... | 10,813 | 11 | 66 |
| 1903 | United Kingdom..... | 22,435 | 156 | 497 |
| | Rest of Europe..... | 8,937 | 25 | 100 |
| | Totals..... | 177,363 | 536 | 2,259 |
| 1903 | United States..... | 207,977 | 321 | 3,233 |

¹ Since 1900, French reports cover only accidents to trains.

GENERAL LIABILITY TO ACCIDENT

That undue prominence is given to railway accidents is shown by the following statement of "accidents resulting from causes to which all men are exposed without regard to their employment," taken from the Year Book of the Travelers' Insurance Company for 1905:

| | Per cent |
|-------------------------------|----------|
| Accidents to pedestrians..... | 24.14 |
| At house (indoors)..... | 18.80 |
| Horses and vehicles..... | 18.16 |
| At house (outside)..... | 15.98 |
| Recreation..... | 6.15 |

A STATEMENT OF THE PUBLIC'S INTEREST

(h) Railway Accidents

It is difficult to coolly characterize the railroads' statement upon this point. To manipulate capital and stocks is bad enough, but it is another thing when one comes to human life. According to such a sober authority as the *Journal of the American Statistical Association* (March, 1906), based upon the reports of the U. S. Interstate Commerce Commission, it is nearly four times as dangerous to be a railroad employee in the U. S. as in the United Kingdom, and more than four times as dangerous as to be employed on most of the government-owned roads of Europe. Yet the railways' astonishing statement is that statistics show that it is safer to be a railway employee in the U. S. How does the railways' statement arrive at this astonishing assertion? It says so because our American trains carry more freight per number of employees, and in proportion to the number of freight tons carried one mile, fewer railway employees are, therefore, killed in this country than in Europe! But freight or lives? Of what are we talking? When per number of men employed nearly four times as many are killed in the U. S. as in the United Kingdom, it is pretty poor comfort to the widow and the orphan, to be told that the husband and father's death helped carry more freight per ton-mile, than he could have done if living in England. If the railways desired to show how our railway men are overworked, their statistics might answer, but statisticians, other than railway men, do not measure life by amount of freight carried per ton-mile. All statisticians except these railway officials are unanimous that our railways recklessly kill more people than any other railways in the world.

Another point: Who would imagine from reading the railway statement that besides the 321 passengers and 3,233 employees killed by the railways in 1903, there were also 5,879 other persons killed, who were neither passengers nor employees, but killed on the railways mainly at grade crossings? Of them the railways' statement gives no hint. But fortunately the Interstate Commerce Commission does speak of them. Most statisticians cannot ignore 5,879 persons killed. Yet in Europe there are few such accidents because of the absence of grade crossings and the careful guarding of the roads. Still for our railways to be so careful would require filling our capitalization with something more than water, or we should have to increase the number of our employees measured by the amount of freight carried per ton-mile. As for injuries, the railroads' statement is again wholly silent. Yet one would think that 60,481 employees, 8,231 passengers, and 76,553 others injured on railways in the U. S., in 1903, sufficient to be reported by the Interstate Commerce Commission, deserved some statement from the railroads.

One point the railways' statement does try to make. It considers that the public gives "undue prominence" to such a little matter as killing 9,480 people and injuring 145,255 in one year, because the Travelers' Insurance Company reports 24.14 per cent of accidents to pedestrians and only 4.77 per cent to accidents on trains. But have the railroads asked themselves what proportion of time the average man spends a year

THE RAILWAYS' OWN STATEMENT

| | |
|------------------------|--------|
| Railroad travel..... | 4.77 |
| Bicycle accidents..... | 4.06 |
| Street-car travel..... | 2.74 |
| Use of firearms..... | 1.73 |
| Animal bites..... | 1.52 |
| Assaults..... | 1.20 |
| Steamship travel..... | .70 |
| Miscellaneous..... | .05 |
| | 100.00 |

NOTE.—Only 1 in 10 of the accidents in railroad travel were to passengers.

These figures prove that American railways are not less careful of human life than foreign roads, but that the difference lies in the extent and volume of their traffic.

RAILWAY RELIEF DEPARTMENTS (for Germany, see **INDUSTRIAL INSURANCE**): These began in England, 1850; Canada, 1873; and the United States, 1880. The object is to create savings funds, to which the employees can contribute in dues, for their relief in case of sickness or accident and for their families in case of death. Several of the larger railroads of the U. S. have such departments, the first to do so being the Baltimore & Ohio, in 1880. Sometimes insurance in them is made compulsory for the employees and sometimes not. The Baltimore & Ohio made it compulsory for new employees. Each such employee receiving \$50 per month was compelled to pay into the fund \$1.50 per month and was entitled to \$1 per week (for 52 weeks) in case of sickness or disablement; \$1,000 in case of death from accident; \$500 in case of death from sickness. The employee, however, forfeited his right to sue for damages. In twenty years the Baltimore & Ohio paid out \$6,010,199 to employees and \$1,447,232 for expenses, its income being from dues and interest on cash on hand. The Pennsylvania established a similar system in 1885, and paid out \$7,797,532 in five years. The Reading, Plant, Burlington, and Atlantic Coast Line followed suit, tho all of the systems were not made compulsory.

In 1884 the Baltimore & Ohio established also an old-age pension, and the Pennsylvania, a large fund in 1890. The latter paid out \$244,619 in the first year to persons over sixty-five and thirty years or more on the company's pay-roll.

RAILWAY UNIONS, AMERICAN: The railway employees of the United States number more than 1,000,000 persons, of whom 300,000 are organized in the so-called railway unions. The principal organizations are: the Grand Brotherhood of Locomotive Engineers, the Order of Railway Conductors, the Brotherhood of Locomotive Firemen, the Brotherhood of Railroad Trainmen, the Order of Railway Telegraphers, the Switchmen's Union of North America, and the International Brotherhood of Maintenance-of-Way Employees.

Originally the engineers admitted firemen and machinists, but after six months membership was restricted to locomotive engineers; the membership of the Trainmen consists of conductors, brakemen, train baggagemen, train flagmen, yardmasters, yard foremen, and switchmen; the Telegraphers receive telegraphers, line repairers, levermen, or interlockers, including all employees connected with the operation of signal towers and interlocking plants; the Maintenance-of-Way

A STATEMENT OF THE PUBLIC'S INTEREST

on trains (including the large number who rarely if ever go on trains at all), compared with the time spent afoot? The percentage of accidents on trains occurs wholly in the comparatively small proportion of time per year the average man spends on trains. The "undue prominence" given, however, to needless and cruel accidents to brakemen and others on American railways is probably due to the inability of the American public to appreciate the number of tons of freight per ton mile carried by each overworked employee.

A few other points NOT covered by the railways' statement:

The purchase of legislation by American railways. (See article **CORRUPTION**.)

The violation of existent laws.

The persistent disregard of the public.

The robbery of the public purse by overcharges for carrying the U. S. mails.

Employees admits all persons employed in the track, bridge and building, water and fuel department, and signal and interlocking service.

The most significant feature of the railroad unions is the extent to which they have developed their systems of insurance against death and disability. The insurance departments

**Benefit
Features**

have occupied a chief place in their systems of organization and are today comparable in benefits paid to any of the fraternal insurance societies. These unions furnish insurance to their members in amounts varying from \$1,500 to \$4,500 in the Engineers; from \$1,000 to \$3,000 in the Conductors; from \$1,500 to \$3,000 in the Firemen; from \$500 to \$1,350 in the Trainmen; from \$300 to \$1,000 in the Telegraphers; from \$600 to \$1,200 in the Switchmen, and \$500 to \$1,000 in the Maintenance-of-Way Employees. The insurance is compulsory upon all members who can pass a satisfactory physical examination and is furnished at actual cost, which varies from \$7.20 per \$1,000 in the Telegraphers to \$20 in the Switchmen.

Since the organization of the insurance department in 1867 the Engineers, up to May, 1900, had paid \$8,562,447 in death and disability claims, and on Jan. 1, 1906, had \$87,679,000 in outstanding insurance. The Conductors, on Jan. 1, 1906, after paying insurance since Oct., 1870, showed a total of \$7,989,567 paid for death and disability. The Firemen, from 1874 to June 30, 1905, have paid \$8,751,315 insurance, and on June 30, 1904, had outstanding insurance to the amount of \$75,559,000. The Trainmen during 1889-1905 inclusive paid \$11,725,059.83, and on Jan. 1, 1905, showed \$77,330,600 insurance in force. The Telegraphers, the Switchmen, and the Maintenance-of-Way Employees are younger organizations. Since Jan. 1, 1898, the Telegraphers have paid about \$200,000 in death benefits. The Switchmen, up to Jan. 1, 1906, paid \$511,350 in death and disability claims. The Maintenance-of-Way Employees since organization in 1887 paid, up to Sept. 30, 1904, about \$150,000.

The most distinctive characteristic of the insurance features of these organizations has been the placing of disability insurance on an equality with death insurance. The fact that railway em-

ployees are especially exposed to the risk of disabling accidents has been the chief influence in this direction. The large number of claims paid for disability in the Conductors' and the Firemen's and the Trainmen's beneficiary departments during recent years shows the high importance of disability insurance to the men engaged in the most hazardous occupations. The Firemen for eleven years, from 1894 to 1904, paid disability claims equal to 24.5 per cent of the whole number of claims paid, about one third of the number of death claims. Among the Conductors the disability claims for the same period amounted to one seventh of the death claims paid. The Trainmen, during a period of twenty years, 1884-1904, paid disability claims equal to 32½ per cent of all claims. Owing to greater efficiency in administration of disability laws and the improved conditions under which the work of conductors, firemen, and trainmen are performed, the number of disability claims shows a decrease. During 1893-94 and 1903-4 the disability claims paid by the Conductors were respectively 3.8 and 3 per 1,000 of the total membership. In the Firemen during the biennial terms 1894-96 and 1902-4 they were respectively 6 and 4.3 per 1,000. In the Trainmen for the years 1886, 1890, 1896, 1900, and 1904 they were respectively 4.6, 8.6, 7.2, 4.9, and 5.2.

The primary purpose of the insurance features is to obtain for the members and their families a higher degree of economic security. They have undertaken to insure against two great economic contingencies, first, the loss to a family of an income-earning member, and second, the economic hardship of shifting from one industry to another made necessary by certain severe physical accidents. The present system represents a compromise between the original idea of purely charitable relief and the modern idea of business protection. Furthermore, the insurance features have been the means of securing and retaining members and thus increasing the strength of the organizations as factors in collective bargaining.

The railway unions are among the oldest of existing American national trade organizations. The Brotherhood of Locomotive Engineers was formed at Detroit, Mich., Aug. 17, 1863, as the "Brotherhood of the Footboard," and was reorganized at Indianapolis, Ind., Aug. 17, 1864, under the present name. The organization was prosperous from the outset, and at the twenty-first convention in 1884 Grand Chief Arthur reported 258 subordinate divisions with 16,000 members; and at the sixth biennial session in May, 1904, Grand Chief Stone reported 652 divisions with 46,400 members. The Order of Railway Conductors was organized at Mendota, Ill., July 6, 1868, as the "Conductors' Brotherhood," and reorganized at Columbus, Ohio, on Dec. 15, 1868, under its present name. On Jan. 1, 1890, the Order had 249 subordinate divisions and 13,720 members; on Jan. 1, 1904, there were 446 divisions with 31,288 members. The Brotherhood of Locomotive Firemen was organized at Port Jervis, N. Y., on Dec. 1, 1873, as a benevolent association. In 1885 it became a labor organization with a protective policy. Its early growth was retarded by the great strike of 1877, by the opposition of the International Firemen's Union, by the difficulties with the Knights of Labor in 1885, and by the Chicago, Burlington & Quincy strike of 1888. In spite of these tem-

porary checks the Brotherhood has grown rapidly and showed by the close of 1893 510 lodges with 28,681 members. During the next two years these fell off to 484 lodges with 21,408 members; since 1895 the growth has been more rapid than ever, and at present the membership numbers about 55,000. The Brotherhood of Railroad Trainmen was founded at Oneonta, N. Y., Sept. 23, 1883, under the name "Brotherhood of Railroad Brakemen," which it retained until Jan. 1, 1890, when, because many of its members had been promoted in the service, the more appropriate name of "Brotherhood of Railroad Trainmen" was adopted. On Aug. 31, 1893, the membership was 28,540, but on Dec. 31, 1894, it had fallen to 22,359, and at the close of 1896 to 22,326. Since 1896 the increase has been rapid, and on Dec. 31, 1903, there were 699 lodges with 68,158 members. The Order of Railroad Telegraphers was instituted at Cedar Rapids, Iowa, June 9, 1886. By April 30, 1893, the membership numbered 17,780. Then followed a rapid decline to 10,114 on April 30, 1894, 6,684 on Dec. 31, 1894, and finally to 4,976 on Dec. 31, 1895. On Aug. 31, 1904, the members had increased to 37,700. The switchmen had a local organization as early as Aug. 1, 1877, but a national union was not formed until Feb. 22, 1886, when the Switchmen's Mutual Aid Association was inaugurated. This association was forced by the defalcation of its treasurer to disband in 1894, and a new organization, the Switchmen's Union, was formed in 1897. Since then the union has grown rapidly and on Jan. 1, 1903, had a membership of 14,000. The present International Brotherhood of Maintenance-of-Way Employees has suffered many vicissitudes in its development. In 1887 it was organized as the "Order of Railway Trackmen." In Oct., 1891, this organization, with a membership of 600, united with the "Brotherhood of Railway Section Firemen," an organization of 400 members. The new union took the name of "Brotherhood of Railway Trackmen of North America." In 1903 the organization became the Brotherhood of Maintenance-of-Way Employees. During recent years the brotherhood has shown considerable increase. In 1903 over 15,000 members were added, making a total of over 40,000 on Jan. 1, 1904.

RAILWAY UNIONS (ENGLISH): *The Amalgamated Association of Railway Servants*, the main English union of railway employees, was organized in 1871, and having in 1904 616 branches with 53,407 members. It had in 1904 an income of £60,118, and expended £42,470, mainly in grants and benefits. *The Associated Locomotive Engineers and Firemen* were organized in 1880, with 12,100 members in 1904, and the *General Railway Workers* in 1889, with 3,617 members in 1904.

RAND SCHOOL OF SOCIAL SCIENCE: Founded in New York City in 1906, for the teaching of political and social science from the standpoint of socialism.

The resources of the Rand School are made up: From the income of an endowment bequeathed by Mrs. Carrie A. Rand; from tuition; from the sale of books and pamphlets; from dues and contributions of members of the Rand School Society, and from other voluntary contributions.

The officers of the society are Algernon Lee, president; Morris Hillquit, treasurer; and W. J. Ghent, secretary. Address: 112 East Nineteenth Street.

RAPP, GEORGE: Founder of the German Harmonist Colony in the United States (see HARMONISTS); born, 1757, at Iptingen Württemberg. He was very religious, but soon developed ideas of his own as to the Church and State. He began preaching in 1787, but being persecuted, gathered his possessions and followers and emigrated to the U. S. in 1803. The colony of Harmony was established in 1804 in Butler County, Pa., from whence it was removed to Posey County, Ind., in 1814-15. In 1824 the colonists sold out to Robert Owen, and returned to the neighborhood of Pittsburgh, where they established *Economy*. Rapp was the spiritual and temporal director as prophet, priest, and king, and every matter of importance was referred to him. He governed wisely until his death in 1847.

RAU, KARL HEINRICH: Political economist; born Erlangen, 1792. In 1818 he became professor at Erlangen, and in 1832 at Heidelberg. From 1837 to 1840 was in the First Chamber of the Grand Duchy of Baden, and later a counselor of the duchy. Died in 1870.

His "*Lehrbuch der Politischen Oekonomie*" was long recognized in Germany as almost an encyclopedia in economic studies.

RECALL, THE (or Imperative Mandate): A piece of governmental machinery by which, whenever any of the constituents of a public officer do not like his actions, they can, by signing and filing a petition for his recall, suspend him from office. If he is an elective officer, a new election is held for the balance of his term, and at this election the old officer is a candidate for reelection unless he expressly declines, and others are nominated in the regular way. If he is an appointive officer, the appointing power must appoint some other man. The percentage for the petitions is 50 per cent in the case of appointive officers and sometimes 50 in the case of elective officers, tho in some instances it goes as low as 25 per cent or 20 per cent.

The recall recognizes that the people are the supreme power. It gives them the right to discharge their own servants whenever they wish, a right that is exercised by every private employer.

It distinctly recognizes that the people rule, not one day in the year, but every day; that their officers are not rulers of the people, but the people's servants. It means a more complete and constant control by the people over their own government, and as such it is, of course, in the completest harmony with the fundamental aims of our government.

This view was distinctly sustained by the courts in the Los Angeles case in the summer of 1905. An alderman who was ousted from his office by petition and subsequent vote of the people, applied for reinstatement, and one of his grounds was that the people had made a contract with him for a definite period and that it could

not be abrogated except by mutual consent. The court explicitly denied this contention and said the officer did not have a vested or property right in his office.

The agitation for the recall in Switzerland began about the same time as that for direct legislation proper, or the initiative and referendum, and it was incorporated into their law in some places; but after the Swiss people secured the initiative and referendum so generally, the need for the recall lessened and to-day the agitation for it in Switzerland has almost subsided.

From 1895 and on Hon. J. Warner Mills, of Denver, headed an active but unsuccessful agitation for its insertion in the Denver city charter.

It was adopted two or three years ago in Los Angeles, Cal., and used with telling effect on a recreant alderman. Petitions are now out for a second use of it against an alderman with whom many of his constituents are much dissatisfied. No one could possibly persuade the people of Los Angeles to abandon it now. It has recently been incorporated into the charters of four or five other California cities and into that of Seattle, Wash., where the vote stood 9,312 in favor to 1,271 against, or a majority of over 8,000.

That it is greatly needed in the United States is shown by the franchises given away, the bad laws passed, the jobbery, etc., of our city councils and state legislatures; by the non-administration and bad administration of the laws that we have, by executive officers; by the not infrequent inattention, insolence, and even open defiance of the people by elected officers who feel absolutely sure of their office during its term.

Its effect will be to make legislators far more responsive to the wishes of their constituents, to make executive officers seek to really enforce the laws, and, most important of all, to make the people feel that they are responsible for the men they choose to office and more really interested in their government. If embodied into law it will not often be used, because the fact that it can be used at any time will make officers do their duty.

It is not a part of direct legislation as it has nothing whatever to do with legislation, tho it has with legislators; but the principle behind it, that of bringing the government under the more constant and direct control of the people, is the same as that behind direct legislation, and hence there are few if any advocates of direct legislation but what are also advocates of the recall.

ELTWEED POMEROY.

RECIPROCITY in trade is an agreement made between two countries, whereby they agree to make reciprocal or equivalent reductions in the duties on certain articles. This policy has been considerably advocated in several countries, first prominently in the United States by James G. Blaine. By the third section of the act of Congress of 1890, called the McKinley Act, it was provided that, "with a view to secure reciprocal trade," sugars not above 16 Dutch standard, molasses, coffee, and hides should be admitted into the U. S. free of duty, unless the president should become satisfied that reciprocal favors will not be granted to the products of the U. S. Arrangements of this character were concluded with Brazil, Honduras, Salvador, Guatemala, Nicaragua, Austria-Hungary, Germany, Spain (for Cuba and Porto Rico), and Great Britain (as to British Guiana and certain of the British West Indies).

These arrangements were superseded by the tariff act of Aug., 1894.

Reciprocity treaties have, however, since been signed as follows, under the Wilson Act of 1894, and especially under section 3 of the Dingley Tariff of 1897:

ists, for we are aware that the very existence of human beings necessarily implies a certain social grouping."

RECREATION CENTERS: Public provision of recreation for adults as well as children is increas-

RECIPROCITY TREATIES AND AGREEMENTS SINCE 1850
(Prepared by the Bureau of Statistics of the Department of Commerce and Labor)

| COUNTRIES WITH WHICH RECIPROCITY TREATIES AND AGREEMENTS HAVE BEEN MADE | Signed | Took effect | Terminated |
|---|----------------|-----------------------------|---|
| British North American Possessions (treaty) | June 5, 1854 | March 16, 1855 | March 17, 1866 |
| Hawaiian Islands (treaty) | Jan. 30, 1875 | Sept. 9, 1876 | April 30, 1900 |
| Brazil (agreement) | Jan. 31, 1891 | April 1, 1891 | |
| Santo Domingo (agreement) | June 4, 1891 | Sept. 1, 1891 | |
| Great Britain: | | | |
| Barbados (agreement) | Feb. 1, 1892 | Feb. 1, 1892 | Aug. 27, 1894 |
| Jamaica (agreement) | Feb. 1, 1892 | Feb. 1, 1892 | |
| Leeward Islands (agreement) | Feb. 1, 1892 | Feb. 1, 1892 | |
| Trinidad (including Tobago) (agreement) | Feb. 1, 1892 | Feb. 1, 1892 | |
| Windward Islands, excepting Grenada (agreement) | Feb. 1, 1892 | Feb. 1, 1892 | |
| British Guiana (agreement) | Feb. 1, 1892 | April 1, 1892 | |
| Salvador (agreement) | Dec. 30, 1891 | Feb. 1, 1892 (provisional) | |
| Nicaragua (agreement) | March 11, 1892 | March 12, 1892 | |
| Honduras (agreement) | April 29, 1892 | May 25, 1892 (provisional) | |
| Guatemala (agreement) | Dec. 30, 1891 | May 30, 1892 | |
| Spain for Cuba and Porto Rico (agreement) | June 16, 1891 | Sept. 1, 1891 (provisional) | Still in force Aug. 24, 1894 Still in force Still in force Still in force March 23, 1900 Still in force Still in force |
| Austria-Hungary (agreement) | May 25, 1892 | May 26, 1892 | |
| France (agreement) | May 28, 1892 | June 1, 1892 | |
| Germany (agreement) | Jan. 30, 1892 | Feb. 1, 1892 | |
| Portugal and Azores and Madeira Islands (agreement) | July 10, 1900 | July 13, 1900 | |
| Italy (agreement) | May 22, 1900 | June 12, 1900 | |
| Switzerland (treaty of 1850) | Feb. 8, 1900 | July 18, 1900 | |
| Switzerland | | June 1, 1898 | |
| Cuba (agreement) | Dec. 17, 1903 | Dec. 27, 1903 | |

Reciprocity treaties or agreements were also negotiated and signed under authority of section 4 of the Act of 1897, with the following governments: United Kingdom, for Jamaica, Turks and Caicos Islands, Barbados, Bermuda, and British Guiana; Dominican Republic; Nicaragua; Ecuador; Argentina; France—but the U. S. Senate has not acted upon them.

The treaty with Cuba, which went into operation Dec. 27, 1903, gives a reduction of 20 per cent duty on all dutiable articles from Cuba entering the U. S., and a reduction ranging from 20 to 40 per cent on articles from the U. S. entering Cuba.

Feb. 28, 1906, the president, by proclamation, extended to Germany the benefits of reductions of duty allowed under section 3 of the Dingley Tariff Act. On Sept. 1, 1906, a reciprocal arrangement embracing the same articles went into effect between the U. S. and Spain.

RECLAMATION OF LAND: See IRRIGATION;
SWAMP LANDS.

RÉCLUS, JACQUES ÉLISÉE: French Socialist and anarchist communist; born at Sainte Foy la Grande, 1830; studied in Rhenish Prussia and at Berlin. Coming to Paris, his extreme republican views caused him to leave the country after the *coup d'état* of Dec. 2, 1851. Till 1857 he traveled in England, Ireland, the United States, and New Granada. In 1857 he returned to Paris and published his geographical researches. He wrote various scientific works, contributing as well to anarchist and radical journals. Taking part with the Paris Communards in 1871, he was arrested, and, tho defended by eminent scientists, was sentenced to transportation for life, a sentence afterward changed to one of banishment. Going to Switzerland, he was admitted to the benefits of amnesty in 1879. In 1882 he initiated the anti-marriage movement, his two daughters marrying without religious or civil ceremony; appointed, in 1892, professor of comparative geography at the University of Brussels. Died in 1905. Author: "Geographie Universelle"; "Anarchy by an Anarchist"; "Evolution and Revolution." In 1878 he wrote to a congress of anarchists at Freiberg: "We are revolutionaries because we desire justice. . . . Progress has never resulted from mere peaceful evolution. . . . We are anarchists who recognize no one as our master. . . . There is no such thing as morality without liberty. . . . We are also international collectiv-

ingly recognized as essential, especially in the modern city. The playground movement sprang from a public awakening to the pitiful lack of opportunity for play afforded to the child in congested city areas. Children's playgrounds have become accepted necessities in city after city throughout America and Europe. We are now awakening to the need for recreation facilities which will serve not only the children but the whole family and every member of the community, young and old.

The most complete system of public recreation centers has recently been worked out in Chicago, but it was preceded by earlier and partial provision in Boston and New York.

Boston, the first American city to establish playgrounds, was also the first to establish free public indoor gymnasiums. The first of these was opened in 1897, and from this the idea was developed that each ward or section of the city should have "ward buildings" containing baths, gymnasiums, and assembly halls. The scheme has only partially been carried out. New York has made the best progress in opening its public school buildings for social and recreative purposes. The Chicago system of recreation centers in small parks involves, however, practically every essential feature of the earlier enterprises and in addition makes a great advance beyond anything hitherto attempted in this country or abroad.

The Boston plan was developed and its out-working still remains under the direction of the Department of Baths. Other cities insist that

the Board of Education is the only proper authority under which to place not only playgrounds but all public provision of gymnasiums and recreative facilities. The Chicago development, however, has been accomplished by the South Park Commission of that city.

In 1900 one of the foremost park experts of our country, George A. Parker, of Hartford, Conn., made an investigation of the lack of parks in industrial communities. In his report he described his ideal of the socialized park:

I would have playgrounds for the children, lots of shade, and, if possible, grass where the workingman's wife and children could sit during the summer afternoons. I would have lots of seats and tables and a superabundance of light, so that the man after a hard day's work would find a pleasant place during the evening hours, one in which, if he so desires, he could take his evening meal. I would have bright flowers, as circumstances would permit, but none or few shrubs. I would have a stadium where contests could take place, and an outdoor and indoor gymnasium. I would have a shelter with an abundance of room, light, and heat for rainy evenings and winter. I would have band concerts and parties. I believe that the park which is needed in industrial cities has not yet been built.

Mr. Parker's prophecy has been fulfilled to the smallest detail in the Chicago enterprise which was carried through by the South Park Commission under the leadership of President Henry G. Foreman and Superintendent J. Frank Foster.

Enthusiastically backed by the people of the South Side, who voted with large majorities in favor of the various bond issues, these commissioners expended between the years 1904 and 1907 \$6,500,000 in securing the land and erecting ten superb neighborhood club-houses in as many parks. The cost of buildings and improvements, exclusive of land, averaged no less than \$90,000, and the average annual cost of maintenance is from \$25,000 to \$30,000 for each center—this including all expense, indoor and out. On the West Side of Chicago the people voted in 1906 to authorize the Park Commission of that section to issue \$1,000,000 in bonds. This amount has created three recreation centers similar to those on the South Side. And in April, 1907, the North Side voted \$500,000, while the South Side at the same election voted \$3,000,000 to extend the superb system of ten already established. These ten recreation centers in small parks are all located in neighborhoods of working people, several being placed to serve the needs of the hundred thousand or more whose wage-earners are employed in the stock-yards and packing-plants.

The areas of these small parks vary, the five smallest being ten acres each in extent while the largest is sixty acres. Each one of the ten includes a generous ball field, which in the winter is turned into a skating-rink, a toboggan-slide being erected at one end. There is an outdoor gymnasium for men and boys and another for women and girls, both having competent gymnasium instructors. A large swimming-pool is provided—suits, towels, and use of dressing-rooms being absolutely free. The sand piles and wading-pools for children have seats surrounding them so that the mother can sit comfortably under an awning and watch her children at play, perhaps bringing sewing or other work that needs to be done. The playground is divided into different parts for younger and older children so that each group may have just the sort of apparatus and games adapted to its particular age.

The most progressive feature of the recreation center is the people's club-house with its indoor gymnasiums and locker rooms, its assembly hall

for meetings and social gatherings, its small club rooms for the use of small gatherings of societies, its restaurant, providing simple articles of food at little cost, and its reading-room, maintained as a branch of the public library. For none of these facilities except the restaurant is there the slightest charge. The boy or girl enrolls in a gymnasium class in the autumn when the outdoor gymnasiums can no longer be used. If he is regular in attendance and has a gymnasium suit, he is given the use of a locker for the year. A neighborhood mandolin club or debating society has but to apply in order to secure a fine club room for meeting-place once a week throughout the winter. Similarly a group of young people wishing to have a party is given the use of the beautiful assembly hall, palm and flower decoration being supplied by the Park Commissioners at no cost. The same hall may be used by men's or women's clubs for series of lectures on topics of interest and value to the neighborhood. Banquets have been held by local organizations. In fact the space and facilities are at the disposal of the people of the neighborhood for any reasonable use except political and religious meetings.

The pessimists who doubt whether the people take advantage of opportunities will be astonished by the use of these playgrounds and community club-houses. The total attendance on the ten recreation centers for the year ending Nov. 30, 1906, the second year of their existence, was 5,473,695, and this figure does not include visitors or onlookers, but only those who made actual use of the facilities. The indoor gymnasiums had 31,276 different individuals enrolled in gymnasium classes, while the attendance for the year mounted up to 371,158. Of the twenty gymnasiums thus provided, there are four classes a day: just after school is the time for the younger school children; the latter part of the afternoon is for the older school children; in the early evening the classes are designed for working boys and girls, while the latter half of the evening is given over to adults. The shower-baths had an attendance of 806,032; swimming-pools, 756,299; reading-rooms, 608,274; social gatherings and lectures in the assembly halls, 186,534; use of smaller club rooms by 28,239; the lunch rooms had 429,312 customers at five cents or more each; the outdoor gymnasiums, 2,278,847. In the playgrounds and gymnasiums the greatest vigilance is exercised to prevent accidents, and with the enormous attendance it is marvelous that during 1906 there were only thirty-five outdoors, twenty-six in the indoor gymnasiums, and three in the swimming-pools.

Other cities have begun to take notice of this extraordinary civic enterprise, and it has stirred President Roosevelt to express his admiration for Chicago's forward step. Just before the convention of the Playground Association of America in Chicago, in June, 1907, he called public attention to them in the following words: "I trust that all our larger municipalities will send representatives to see the magnificent system that Chicago has erected in its South Park section, one of the most notable civic achievements of any American city."

GRAHAM ROMEYN TAYLOR.

RED CROSS SOCIETY, THE: Was organized at Geneva, Switzerland, in 1866; in the United States in 1884. The name comes from its flag, a red cross on a white field.

"It is a confederation of relief societies in different countries, the aim of which is to ameliorate the condition of sick and wounded soldiers in time of war; and its operations extend over nearly the entire civilized world." This is from the original constitution of the society in Europe. Its organization in Switzerland was due to the efforts of Mr. Henri Dunant and Florence Nightingale, who had done most efficient service during the campaign in the Crimea (1854-56).

In the United States, comparatively exempt from the danger of war, the scope of the society is enlarged. Its constitution says "that the society shall have for one of its objects aid to the suffering in times of great national calamities, such as floods and cyclones—visitations to which we are peculiarly liable—great fires, pestilence, earthquake, local famines." Its organization was due to Miss Clara Barton, until 1904 its active president. During the Civil War Miss Barton did efficient service in alleviating the suffering of the sick and wounded. In the Franco-Prussian War she was connected with the European Red Cross Society, and after her return to this country she finally got the Red Cross Society recognized by the U. S. Government. The organization acts under the Geneva Treaty, the provisions for which were made in international convention at Geneva, Switzerland, Aug. 22, 1864, and have since been signed by nearly all civilized nations.

Many great national calamities have claimed the services of the Red Cross in the U. S. After the great forest fires of Michigan came the floods in Ohio and Mississippi in 1882; the Mississippi cyclone; the floods of 1884; the Virginia epidemic; the Texas drought; the Charleston earthquake; the Mount Vernon (Ill.) cyclone; and the great Johnstown disaster. The society also ministered to the peasants of Russia during the great famine there, and is in Turkey aiding the tortured Armenians. More recently in Cuba. Philippine typhoon (1905), Japanese famine (1905-6), Vesuvian disaster (1906), San Francisco earthquake (1906), Valparaiso earthquake (1906), Gulf storm (1906), Chinese famine (1906-7), Russian famine (1906-7).

In 1905 the American National Red Cross was re-incorporated by Act of Congress, and is now under government supervision. *Secretary*, Charles L. Magee, Room 341, War Dept., Washington, D. C.

REDMOND, JOHN E.: Member British Parliament for Waterford, Ireland; born 1856; was educated at Clongowes College, Kildare, and Dublin colleges. He entered the civil service, and was for a time clerk in the vote office, House of Commons. In 1886 he was elected to the bar at Gray's Inn. He sat in Parliament for New Ross, 1881-85; Wexford, North, 1885-91; Waterford, 1892 to the present. In 1900 he was elected chairman of the Irish Parliamentary Party, and led it with great ability, always ready to ally himself with any English party which would assist the Irish to reach their coveted goal—an independent Ireland with home rule. In this behalf he visited the United States in 1904. *Address:* Upper Fitzwilliam Street, Dublin, Ireland.

REEVES, HON. WILLIAM PEMBER: The first Minister of Labor in New Zealand and since 1896 Agent-General for New Zealand in London; born in Christchurch, New Zealand, 1857. Winning academic honors in New Zealand, he was sent to

Oxford to be educated for the English bar, but returned and entered the New Zealand bar, which, however, he soon relinquished for journalism on his father's paper. In 1887 he entered Parliament and became a leader in the legislative reforms that swept the country in 1890. In 1891 he entered the cabinet as Minister of Labor, where his great work has been the establishment of industrial arbitration, adopted almost without opposition in 1894. In 1896 he went to London as Agent-General for New Zealand. He is author of various books and articles on New Zealand.

REFERENDUM (for definitions and the principles involved, see **DIRECT LEGISLATION**, p. 384-387): The immediate origin of the referendum is in the famous Swiss *landsgemeinden* (see below), tho precursors may be found in the ancient *Eccllesia* of Athens, or the general assembly instituted by Solon, in the sixth century B.C., where the citizens had the right of voting on war and peace and questions of general policy. Somewhat akin, too, was the Roman *Comitia Tribula*, or meetings of the people by tribes, which was made in the republic a lawmaking assembly. Compare, too, the gathering of the *ceorls* (churls) in the German mark, where every freeman had a right, by the clash of his shield, to signify assent to the proposition of the earls, or, by refusing to do so, to withhold assent, and this vote being a final decision. (See **MARK**.) (For the American town meeting, see **DIRECT LEGISLATION**.) Similarly in Switzerland, from times immemorial the people of at least some of her cantons, notoriously of Uri and Appenzell and the two Unterwalds, have met, in assemblies, or *landsgemeinden*, in the open, and decided laws by a direct popular vote. As, however, the cantons (see **SWITZERLAND**) grew in population, and the confederation took in towns and cities, this was not always possible, tho the custom still obtains in Uri, Appenzell, Glarus, and the two Unterwalds. Yet even in the cities at various times all the citizens were asked to

vote on certain measures, as in Bern and Zurich at the time of the Reformation, to see how many were Protestants. Bern, from 1469 to 1524 is said to have taken sixty referendums. The referendum appears, too, in a rudimentary form as early as the sixteenth century in the cantons of Graubünden or Grisons and Valais, before those districts had become full-fledged members of the Swiss confederation, and while they were still known as *Zugewandte Orte*, or Associated States. Delegates from their several communes met periodically, but were always obliged to refer their decisions to the communes themselves for final approval. In the same manner the delegates from the various cantons to the old Federal Diet, or assembly of the Swiss confederation, referred their votes to these states. In 1802 the constitution of the Helvetic Republic was referred to a popular vote. Most of the Swiss cantonal constitutional changes have been made by the referendum, and their constitutions now usually require that all such changes be thus made. St. Gall gave the people the right to prevent a law coming into force in 1831; the commune of Basel, in 1832; Valais, 1839; Lucerne, 1841. Valais in 1842 passed a measure referring all laws to the people, but the people voted against the law. Vaud in 1845, and Bern in 1846, adopted the optional referendum. In 1868, after an agitation largely led by the Socialist, Karl Bürkli (q. v.), the com-

pulsory referendum was adopted and the initiative, if one third of the members of the Great Council, or 3,000 citizens, demanded it. Thurgau, Bern, Schaffhausen, soon followed, till the compulsory referendum exists to-day in all the Swiss cantons except Freiburg.

The federal referendum was established in 1874. It is compulsory for an amendment of the constitution, if called for by 30,000 citizens or eight cantons. The initiative (see DIRECT LEGISLATION) if supported by 50,000 voters also exists in the federal government; tho nominally admissible only on constitutional amendments, it is in practise applied to any measure by giving it the form of a change in the constitution. Between April, 1874, and Oct., 1896, no less than thirty-eight referendums were taken.

As to the results, however, in Switzerland, authorities somewhat differ, tho it is probable, too, that it is a privilege now so deeply rooted that it could not be taken from the law books. Generally speaking, democratic and progressive students believe it to be a great success, and advocate its adoption in every country. If at times it has prevented the adoption of progressive measures, they argue that this, too, is well, since it shows that the people were not ready for such measures, and the will of the people should be enacted even against progress. Not all, however, hold this view. Says a resolution printed in the (English) *Fabian News* for April, 1896, to be presented to the Socialist Congress of that year:

Resolved, That this congress warns associations of the working classes throughout the world to scrutinise with great care all proposals for transferring direct legislative and administrative power, including the appointment of public officials, from representative bodies to the mass of the electors. The people can only judge political measures by their effect when they have come into operation; they cannot plan measures themselves, or foresee what their effect will be, or give precise instructions to their representatives; nor can any honest representative tell, until he has heard a measure thoroughly discuss by representatives of all other sections of the working class, what form the measure should take so as to keep the interests of his constituents in due subordination to those of the community. It is to be considered, further, that intelligent reformers, especially workmen who have grasped the principles of socialism, are always in a minority; they may address themselves with success to the sympathies of the masses and gain their confidence; but the dry detail of the legislative and administrative steps by which they move toward their goal can never be made interesting or intelligible to the ordinary voter. For these reasons the referendum, in theory the most democratic of popular institutions, is in practise the most reactionary, and is actually being strenuously advocated in England by noted leaders of anti-Socialist opinion with the openly declared intention of using it to stop all further progress toward social democracy.

Nevertheless, the belief in and adoption of the referendum and initiative are spreading through all progressive countries (see DIRECT LEGISLATION), notably in the Western United States upon all questions and in all portions of the U. S. on questions of license.

REFORMATORIES: The very name now applied to intermediate prisons is significant, for the word reformatory indicates a modern theory of social treatment of criminals. Punishment must fit the crime; reformation makes the offender fit to survive. This idea is not absolutely new or modern, but it is only during recent years, and most distinctively in the United States, that it has been introduced in a consistent system of discipline.

In France there are penal institutions for young men, and the administrators of these prisons avail themselves of the aid of philanthropic societies (*patronage des jeunes détenus*) which are found in all parts of the country. Legislation and administrative measures are developing in the same direction as in America. The tendency is to treat all youthful offenders who are not absolutely vicious as acting without complete moral discernment and as capable of improvement by disciplinary education. In England private and public schools for delinquents under sixteen years have rendered valuable service in preventing the growth of crime. The judges exercise discretionary power by warning, fining, suspending sentence, and sending to a reform school. Young men past the sixteenth year are sent to Borstal Reformatory Prison, an institution that seems to be administered in the spirit of our best American reformatories. In some European countries the young offenders are kept separate from older offenders by being placed in isolated cells or in special departments of ordinary penitentiaries.

Very interesting is the movement in Hungary to establish reformatories for young offenders. Those under twenty years of age may be sent by the court to a house of correction or to a separate cell. There are four houses of correction for boys and young men, and one for girls and young women, with accommodations for 700 males and 240 females. It is claimed that after release 65 per cent show good-conduct records, 11 per cent variable, 10 per cent bad, 8 per cent unknown, and 6 per cent are reported as dead. The younger inmates are kept in family-like groups, and are taught handicrafts, ordinary school branches, and religion. There are no institutions exactly corresponding to American reformatories. ("La lutte contre la criminalité des mineurs en Hongrie," par Béla Kun et E. Laday, 1905; "Les institutions pénitentiaires de l'Hongrie," par E. de Megyory, 1905.)

No definition of an American reformatory has yet been universally accepted, nor are all institutions which carry this title conducted on precisely the same basis. For the purpose of this article, "reformatory" means an institution of correction for young men or women convicted of serious misdemeanors and crimes. Excluded from the present discussion are: (a) children under sixteen, who are considered in the articles REFORM SCHOOLS, INDUSTRIAL SCHOOLS, JUVENILE COURTS, CHILD-HELPING; (b) abnormal offenders (see under FEEBLE-MINDED; EPILEPTICS; INSANE); (c) habitual criminals over thirty years of age; (d) confirmed inebriates, vagabonds, degenerates. All these require separate treatment on special principles.

The most famous and influential of all institutions of this class is that at Elmira, N. Y., where Mr. Z. R. Brockway organized in a consistent system a method of correction based on modern principles developed by practical experience in all civilized countries. This he did with a courage, boldness, and originality that have made his work the center of observation for the whole world and a stimulus for experiment everywhere. Other states of the union have established institutions of the same general type. A list of these institutions is given in the "Proceedings of the National Prison Association for 1905."

Some of the essential principles of the American reformatory may be thus briefly formulated:

(1) The "indeterminate" sentence law must be at the foundation. Progressive educational methods are impossible under a sentence fixed in advance, and in no way modified by the conduct of the prisoner.

Principles

The revolutionary character of the Elmira Reformatory was made possible by the Law of 1877, chapter 173, section 2, which reads: "Every sentence to the reformatory of a person hereafter convicted of a felony or other crime shall be a general sentence to imprisonment in the New York State Reformatory at Elmira, and the courts of this state imposing such sentence shall not fix or limit the duration thereof. The term of imprisonment of any person so convicted and sentenced shall be terminated by the managers of the reformatory, as authorized by this act, but such imprisonment shall not exceed the maximum term provided by law for the crime for which the prisoner was convicted or sentenced." (2) There must be individual study of each inmate by the administrative officers, preliminary to classification and prescription of the educational process. (3) Provisional and conditional classification, usually in three or four grades, promotion or degradation being dependent on the conduct of the individual. (4) The marking system. Each inmate is furnished with the regulations of the institution, and his conduct is marked day by day so that he can see the record which he is making. (5) Education—physical, industrial, literary, moral, and spiritual—with disciplinary measures necessary for control. The idea of retribution being abandoned, that of education for life as the only means of social protection rules all the orders and methods of the establishment. (6) Conditional liberation, after a period of preparation and discipline, on parole and under supervision, and recall by the managers without tedious process in case of violation of parole. This last stage is preparation for free life in that free life itself. The architecture of the buildings, the program of each day, the regulations, the choice of officials, the diet, the occupations, the school and worship, all are made to conform to the principle of education for a free life of voluntary activity and conformity to law.

The following states have special intermediate prisons or reformatories for offenders who are not considered confirmed criminals: Colorado, Illinois, Indiana, Kansas, Massachusetts, Michigan, Minnesota,

United States New Jersey, New York, Ohio, Pennsylvania, Wisconsin ("Proceedings National Prison Association," 1905, pp. 347-350).

Baernreither mentions an institution at Gatesville, Texas. The institution at Pontiac, Ill., has two departments, one for boys of ten to sixteen years of age, and one for young men of sixteen to twenty-one. The reformatory at Jeffersonville, Ind., is for young men of sixteen to thirty. The Kansas reformatory at Hutchinson is for young men of sixteen to twenty-five who have not been previously convicted of felony. The Michigan reformatory is at Ionia. In Minnesota the reformatory for young men sixteen to thirty years of age is at St. Cloud; as in Indiana, the agent secures employment and watches over the conditionally released prisoners until they are finally discharged as reformed. The New Jersey reformatory is at Rahway. The Ohio institution, at Mansfield, is for offenders of from sixteen to thirty years of age. The Wisconsin reformatory, at Green Bay, cares for young men of from sixteen to twenty-five who are first offenders. The Pennsylvania reformatory, at Huntingdon, receives first offenders of the ages fifteen to twenty-five. In the main all the reformatories follow the essential principles which govern the famous institution at Elmira, but some differences in methods and devices are due to local conditions, state laws, inventiveness, and peculiarities of directors and superintendents. For example, at Mansfield, Ohio, some very bold experiments have been made with the permission given prisoners to work in the open fields without guards, and very few have escaped. Baernreither noticed at Concord, Mass., that the indeterminate sentence was used there within narrow restrictions; that the

supervising agent is an officer of the prison commission, and not, as at Elmira, an officer of the reformatory directors. Concord has a farm of about three hundred acres, as well as schools, trades, and shops. There is no military drill as at Elmira. Corporal punishment (whipping) is not permitted. Societies for social and educational purposes are encouraged and self-government is thus promoted.

Typical reformatories for women are found at Sherburn, Mass., at Bedford, N. Y., and at Indianapolis, Ind. Sherburn prison was remarkably fortunate in having for its superintendent during its formative period the strong personality of the late Mrs. Ellen C. Johnson, whose influence is felt throughout the nation.

What results have we obtained? Friendly foreign observers, such as Baernreither and Freudenthal, have declared that our statistics are very imperfect and unreliable. The records simply tell us of the conduct of the released persons up to the time of their final discharge; they are not followed farther. Some begin a new criminal career under a new alias. We need a more thorough registration by the Bertillon and fingerprint methods, and a system of correspondence and reports covering several years. The imperfect statistics, supported by the opinions of superintendents and directors, indicate that a very high percentage of the discharged prisoners do well after their lesson. There is no reasonable ground for doubt that the reformatory methods above described yield vastly better results than any others.

RELIEF STATIONS AND HOME SHELTERS

(*Verpflegungsstationen und Herbergen zur Heimath*): German institutions for the benefit of needy or unemployed working men. The relief stations are communal establishments, and provide food and shelter for twenty-four hours, or forty-eight including Sundays; the home shelters are supported by philanthropically inclined persons, and give food and shelter for a week or over. The purpose of both is to prevent vagrancy, mendicity, and pauperism; and to help every self-respecting workman to get work, or be tided over a period of unemployment without having to resort to begging.

Relief stations are supported at public charge, and are intended chiefly to assist destitute and unemployed men with temporary shelter and help in obtaining work. They are in walking distance of each other and in communication by telephone or in other ways, so that they can hear of chances for work and men may be told in which way to look for work. All is, however, under strict discipline.

When a man arrives at a station, he must show his passport and his "labor book" (*Arbeitsbuch*) in order to legitimize himself both as to his character in regard to the authorities and to his industrious habits. These papers are stamped and retained by the superintendent. A simple meal, consisting of soup or potatoes and herring (cost about twenty pfennige), is served at night, and the men are supposed to be in bed by ten. In the morning they must be ready for the simple breakfast by seven, since work begins at eight. The latter consists of stone-breaking, wood-

chopping, or other duties requiring physical exertion, but not exhaustion, and lasts for four hours. The man is then given a plate of food, his passport is signed and stamped, and sent on his way. If the next station should be too far to be reached during the afternoon, he receives, if penniless, a ticket to a by-station (*Nebenstation*), where he receives food and shelter. By-stations may be had in any number, since they are not special buildings, but approved lodging-houses or inns. A clergyman or other person of good reputation sees to it that they are properly conducted. The cost of feeding and housing a man per day at these stations, including all expenses of management, is about sixty-five to seventy-five pf., and is charged to the rates.

The motto of these stations is that a man must work for what he gets; work in the morning, walk in the afternoon. If he refuses to do that he is turned over to the police as a vagrant, or left to shift for himself. The latter course brings him into touch with the police, since in many towns and villages maintaining stations private almsgiving is forbidden and punished by law. The man must, consequently, either work or go hungry. This system, comprizing at present about 1,000 stations, has put a stop to mendicity and vagrancy in all provinces of Germany, where they are sufficiently near together. The only complaint which people interested in this problem make, is that their number is too small; under the leadership of Pastor Bodelschwingh they are seeking for legislation to the effect that relief stations should be planted everywhere in the German Empire, so as to help every poor and destitute laborer, and still allow him to move on in search of work.

This is generally provided at the *Herberge zur Heimath* or *Home Shelter*. The home is usually located in a larger town, and is always provided with an employment bureau. Owing to the *Wanderer*, the paper of these institutions, they keep in touch with each other and know fairly well where workmen are needed, so that they can readily supply employment to those who are willing to take it. The procedure on the arrival of a workingman at the home is similar to that at the station, with the exception that if a man has lost his passport the superintendent will procure it for him on payment of fifty pf. or four hours' work in the relief station adjoining. The home is, furthermore, intended to be, as far as possible, a home for the time being to all working men who come under its shelter. It must be kept clean and orderly; furnish cheap but wholesome food; provide religious influences by means of daily services, and banish all harmful practises from its premises, e. g., gambling. In order to have this program carried out, every home is under the supervision of a responsible committee, whose members must be reputable persons, and, if possible, include the local clergy.

The home is usually supplied with a good map of the circuit and country, showing the country roads in every direction, so that the superintendent may advise those who depart as to the quickest way of reaching a certain point. A man may stay in a home for a whole week, provided he pays the moderate charges, about seventy-five cents per day for meals and room. A young pastor or candidate looks after the inmates spiritually both week-days and Sundays.

The increase of the homes has been phenomenal. Professor Clemens Theodor Perthes, of the

University of Bonn, established the first one in that city in 1854; in 1863 there were 19; in 1873, 101; 1886, 252; 1890, 370; 1900, 457; 1904, 462, with over 20,000 beds. In 1903 the homes lodged 1,966,357 paying guests and 683,586 free guests; the latter at a cost of about fifty pf. per day, or about 368,600 marks.

The various homes have formed an organization, *Deutscher Herberge Verein*, with *Der Wanderer* as their organ; the whole German Empire is subdivided into fifteen unions or subdivisions for the sake of better control and greater efficiency. It was, for instance, largely owing to the efforts of this organization that the relief stations were established by the towns and villages.

RELIGION IN PUBLIC SCHOOLS (for special articles on this subject in Great Britain from the Church of England and from the non-conformist point of view, see **SCHOOL QUESTION IN GREAT BRITAIN**. For the situation in France, see **FRANCE**): In the United States there has developed, however, a solution which if not satisfactory to all religious people does seem to satisfy the great majority of people with little prospect of its being changed in any important respect. It must be remembered, however, that there are at least four distinct ways of looking at the question: (1) Radicals usually hold that the public schools should have nothing to do with religion; (2) many Christians contend that the State is lost unless it teach morality, and that morality cannot be taught unless it teach religion; while (3) the majority of Roman Catholics, many Anglicans, and a few of other religious communions go still further and say that morality cannot be taught except by giving the definite religious teaching which they hold true. To each of these three factors (radicals not excepted) it is to a large extent a matter of faith or of principle to carry out their view. Nevertheless, there is a fourth method, and this view, altho perhaps a compromise, is the view generally adopted in the U. S., at present in France, and which appears to be the solution of the question. According to this method the public school does not explicitly teach religion at all, yet does implicitly or indirectly, using the Bible more or less as literature and the spiritual as a part of the universe to be studied as truly as the material.

Examples of the different claims are as follows: The platform of the Liberal League of the U. S. contains the following:

We demand that all religious services now sustained by the government be abolished, and especially that the use of the Bible in the public schools, whether as a text-book or avowedly as a book of religious worship, shall be prohibited.

This is the view held by almost all Socialists and by radicals of almost every description. They hold that religion is a personal matter, to be taught in the family or the home. They do not admit that this prevents ethical and moral teaching in the schools.

The view of Roman Catholics, and other believers in parochial or denominational schools, is that morals cannot be taught without religion; that religion cannot be taught in public schools, since it is unjust to tax a Jew to support the teachings of Christianity or vice versa, and that therefore the only way out is to have parochial schools where morals and religion can be taught. Such advocates

Roman
Catholic
View

usually claim that money should be raised for education by the school authorities and then that in some way it should be divided among the various denominational or secular schools in proportion to the pupils in each.

Said Archbishop Ireland, in his address to the National Educational Association (St. Paul, July, 1890):

There is and there can be no positive religious teaching where the principle of non-sectarianism rules.

Says the *Catholic Review* of Aug. 31, 1889:

The parochial school is necessary because Catholic children cannot be brought up Catholic and attend the public school. This is a recognized fact. . . . At the present moment the Catholic Church in America depends more on the faith of the Catholic immigrant than on the faith of the generation which has received its education in the public schools. . . . We see no way of making them (young Americans) Catholics than by the parochial school. Our conscience forces us to take up the work.

In the U. S. various ways of compromise with the Roman Catholic view have been tried. As early as 1823 in New York a conflict arose about the division of public funds. In 1831 a grant of \$1,500 was made for a Roman Catholic Orphan Asylum. In 1868 in New Haven, Conn., a Roman Catholic school taught by Sisters of Charity was sustained by public funds. Roman Catholic schools have been sustained in the same way in Waterbury, Conn., Manchester, N. H., notably in Poughkeepsie, N. Y., and since then such contributions have grown very large in more than one American city.

More recent has been the so-called Faribault experiment, deriving its name from the town in Minnesota where the event took place. Under the auspices and with the approval of Archbishop Ireland, a parochial school belonging to the Church of the Immaculate Conception was handed over (1891) to the school authorities of the state for a rental of \$1; all the teachers, all the text-books, all the work of the school to be carried on under the authority of the state without any agreement that teachers or teaching should be Roman Catholic, depending only on the authorities to do what was fair. This, however, raised a storm of protest in the Roman Catholic Church and almost equally outside it.

Representative of those who hold that the public schools should teach undenominational religion, Dr. Josiah Strong says ("Our Country," p. 101):

When the fathers added to the Constitution the principle of strict separation of Church and State, they did not intend to divorce the State from all religion. Says Judge Story, speaking of the time when the Constitution was adopted,

"The attempt to level all religions, and make it a matter of State policy to hold all in utter indifference, would have created universal disapprobation if not universal indignation." The principle of the separation of Church and State undoubtedly forbids sectarian instruction in the State schools; but we have the highest legal and judicial authority for saying that it does not forbid undenominational religious teaching.

Why does the State take money from your pocket to educate my child? Not on the ground that education is a good thing for him; but on the ground that his ignorance would be dangerous to the State. In like manner the State must teach in its schools fundamental religious truths, not because the child should know them in preparation for a future existence—the State is not concerned with the eternal welfare of its citizens—but because immorality is perilous to the State, and popular morality cannot be secured without the sanctions of religion.

The philosopher Cousin, in a report upon public instruction in Germany, referring to the fact that it is based on the Bible, says: "Every wise man will rejoice in this; for, with three fourths of the population, morality can be instilled only through the medium of religion."

Daniel Webster in a Fourth-of-July oration said:

To preserve the government we must also preserve morals. Morality rests on religion. If you destroy the foundation, the superstructure must fall. When the public mind becomes vitiated and corrupt, laws are a nullity and constitutions are waste paper.

Of course parents and the Church may give as much added instruction as they wish, but for the State to go beyond the inculcation of the fundamental truths common to all monotheistic religions would probably lead to the division of the school fund, which would be a great calamity. On the other hand, to secularize the schools is to invite the corruption of popular morals and thus endanger the very foundations of our free institutions.

For a sample of the last and prevailing view we quote an article by Walter L. Hervey (*The Outlook*, Feb. 10, 1906). He says:

Even if it were possible to make the schools more formally religious and less untheological than they now are, it would not be necessary to do so. First, because such instruction can be given outside of the schools without loss, and even with positive gain. And, secondly, because the public schools can meet every legitimate and reasonable demand for religious teaching without such instruction. It is an abuse of language to say that because the public schools do not explicitly teach the existence of a God they are therefore "godless," and to affirm that because they do not teach anything about Christ and the Church they are therefore unchristian, and to imply that if they do not teach ethics they are therefore immoral. . . .

In reply, then, to the question, What is the content of formal religious instruction in the elementary public school? we answer, Nothing. But in answer to the question, What is the real content of religious teaching? we answer, Everything. There is no subject in the curriculum, there is no relation in the life of the school, which is not packed with potential divinity and may not make for morality. Each study and each experience has its roots in the infinite, and this basic fact may be felt, may be seen, may be lived, without formal instruction therein. The essential principles of Christianity—the fatherhood of God, human brotherhood, the infinite worth of a man, loving service, the abundant life—all these can in every schoolroom be lived, felt, and with increasing clearness known, without claims, without formal credit, and without the inevitable controversies that spring therefrom.

This view appears to be embodied in the "Syllabus on Ethics" which has been adopted for the public schools in the City of New York. Parts of this syllabus are here given as indicating the lines on which, by many thousands of teachers, the problems of moral education are being worked out in the class rooms of a great city system:

It should be the aim of every teacher to make each part of the life of the school count for moral education. This aim should be present not only in formal instruction and training, but also in the general atmosphere and spirit of the class room and of the school. In working toward this aim the following suggestions, based on the experience of practical teachers, will be found helpful:

1. The personality of the teacher is at the root of all moral education in the school. The teacher's ideals, sincerity, poise, self-control, courtesy, voice, manner, dress, and general attitude toward life are potent forces for character-building.

2. Reverence is vital to morality. Whatever quickens in children the feeling of dependence on a Higher Power, whatever leads them devoutly to wonder at the order, beauty, or mystery of the universe, whatever arouses in them the sentiment of worship or fills them with admiration of true greatness, promotes reverence. There is no subject studied in school which, reverently taught, may not yield its contribution to this feeling.

3. Self-respect, which is also fundamental to moral development, is engendered in a child when he does his best at tasks that are worth while and within his power to do well, with proper recognition by teacher and schoolfellows of work well done.

4. The corner-stone of a self-respecting character is principle—the will to be true to the right because it is right, whatever the consequences, to act "with firmness in the right as God gives us to see the right." The essential difference between principle and mere self-interest should be vividly brought home to each child.

5. The spirit of the class room and of the school—the spirit that makes children say with pride "my class" and "our school"—is one of the strongest of moral forces. Where there exists a proper *esprit du corps*, the problem of discipline is largely

New York Syllabus on Ethics

solved. Public opinion as a moral force should be molded and utilized in every school.

6. The child should early gain the idea of social membership. The truth that cooperation and unselfishness are essential to true social living should be made real and vital. This truth is brought home through "group work," where the work of each is necessary to the work of all; and through the feeling in a school or class that the honor of all is in the keeping of each.

The child should also learn that he is a member, not only of the school, but of the family, of the neighborhood, of the city, and of the state and nation. The meaning of loyal membership of these social institutions should be made clear. The naturalness and the necessity of obedience and helpfulness should be shown. The moral aspect of home tasks and of working with and not against the departments of health, street-cleaning, police, and education should be enforced by concrete applications. In general, the truth should be impressed that without loyal and effective social membership no individual can wholly live.

7. No person has a fully developed moral character until there has been a transfer of the seat of authority from without to within himself; a moral man obeys himself. Each child in every grade should be steadily helped toward self-direction and self-government. Effective means to this end are: appeals to initiative and resourcefulness; the development of such a sense of honor as will preserve order without surveillance; and some form of organization designed to quicken and exercise the sense of responsibility. The "school city," when wisely applied and shorn of unnecessary machinery, has been found effective in many schools. But the form of the organization is immaterial. The essential point is that the teacher, himself a member of the community, should make his pupils sharers to a certain extent in the problems arising out of their community life; and that he should entrust to them, as members in their own right of the social body, the performance of certain functions.

9. In connection with the regular studies of the school, certain aspects of contemporary civilization which are of value for developing the social spirit should receive attention. Hospitals, societies for the prevention of cruelty to children and to animals, homes for orphans and for the aged and infirm, fresh-air funds, and similar agencies for social service should be brought within the child's comprehension at the proper stage. Deeds of heroism and self-sacrifice done by firemen, policemen, soldiers, inventors, and persons in the ordinary walks of life should be presented and dwelt on. The truth that success in life means more than mere money-getting can thus be brought home again and again. The contemplation of deeds of cruelty, dishonor, and shame has a necessary, tho subordinate, place in molding moral taste.

11. In all such moral instruction and guidance the following principles should be observed:

- The course of moral training is a development.
- The culture of the imagination is a powerful aid in moral instruction; first, as the power vividly to picture consequences—to put yourself in your own place later on (fore-sight); secondly, as the power to "put yourself in his place" (social imagination, sympathy).
- In using literature and similar material for purposes of moral education, the teacher should not violate the law of self-activity. The child properly resents having a moral drawn for him which he could draw for himself, and he is the more likely to follow the principle which he himself discovers or formulates, because it is his own.
- The most effective method in moral education is positive rather than negative. A mind filled with good interests, high ideals, and helpful activities has no room for evil. Love is a stronger and a better motive than fear.

RENT (Fr. *rente*; It. *rendita*, income; Latin *rendere*, to return) is used, in political economy, specifically for "that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil" (Ricardo, "Political Economy," chap. ii.). The word is sometimes used, even in political economy, in other senses, but in that case the use is explained by the author as something different from the ordinary use, as when one speaks of the rent of ability, the rent of money, the rent of a piano, etc. The word "soil," however, includes that which is beneath or within the soil, all the "natural" advantages of the earth, unimproved by labor. It includes, therefore, mines, streams, water-power, harbors (so far as they are natural), and what is often of greatest importance, it includes the natural advantages of situation, as

land, for example, in the heart of a great city, or at the corner of two great thoroughfares.

Such being the economic use of the word, we pass on to consider the laws and principles which affect rent, and how these are variously conceived by representative writers.

Rent appears on the pages of Adam Smith's "Wealth of Nations" almost incidentally, and not always consistently treated. It is considered as "naturally a monopoly price" (bk. i., chap. xi., pp. 66-67a) to be taken as a matter of course rather than to be explained. Adam Smith says elsewhere, "as soon as the land of any country has all become private property, the landlords, like all other men, love to reap where they never sowed, and demand a rent even for its natural production" (bk. i., chap. vi., p. 23a). Rent, he argues, depends on prices; the fact that

the rent of land varies with its fertility and situation he treats as an obvious commonplace, needing little consideration. We have here some of the elements of the Ricardian doctrine of rent, but wholly undeveloped. Beginning, however, with Anderson and continuing through Buchanan, Malthus, and Ricardo, we have the development of that theory of rent which is usually associated with Ricardo's name and has played so large a part in economic science (see RICARDO).

It is this theory which has entered into all modern discussions and affected the theory of wages and profits and lies at the basis, not only of the *laissez-faire* economics, but of Henry George's single tax and most modern socialism. John Stuart Mill says of this theory:

It is one of the cardinal doctrines of political economy; and until it was understood, no consistent explanation could be given of many of the more complicated industrial phenomena.

Of the critics of the theory, Mills says:

A remark is often made, which must not be omitted here, tho, I think, more importance has been attached to it than it merits. Under the name of rent, many payments are commonly included which are not a remuneration for the original powers of the land itself, but for capital expended on it. The additional rent which land yields in consequence of this outlay of capital should, in the opinion of some writers, be regarded as profit, not rent. But before this can be admitted, a distinction must be made. The annual payment by a tenant almost always includes a consideration for the use of the buildings on the farm; not only barns, stables, and other outbuildings, but a house to live in, not to speak of fences and the like. The landlord will ask, and the tenant will give, for these whatever is considered sufficient to yield the ordinary profit, or rather (risk and trouble being here but of the question) the ordinary interest, on the value of the buildings; that is, not on what it has cost to erect them, but on what it would now cost to erect others as good; the tenant being bound, in addition, to leave them in as good repair as he found them, for otherwise a much larger payment than simple interest would of course be required from him. These buildings are as distinct a thing from the farm as the stock or the timber on it; and what is paid for them can no more be called rent of land than a payment for cattle would be, if it were the custom that the landlord should stock the farm for the tenant. The buildings, like the cattle, are not land but capital, regularly consumed and reproduced; and all payments made in consideration of them are properly interest.

But with regard to capital actually sunk in improvements, and not requiring periodical renewal, but spent once for all in giving the land a permanent increase of productiveness, it appears to me that the return made to such capital loses altogether the character of profits, and is governed by the principles of rent.

Some writers, in particular Mr. H. C. Carey, take away still more completely than I have attempted to do the distinction between these two sources of rent, by rejecting one of them altogether and considering all rent as the effect of capital expended. In proof of this Mr. Carey contends that the whole pecuniary value of all the land in any country, in England, for instance, or in the United States, does not amount to anything approaching to the sum which has been laid out, or

Carey's
Views

which it would even now be necessary to lay out, in order to bring the country to its present condition from a state of primeval forest. This startling statement has been seized on by M. Bastiat and others as a means of making out a stronger case than could otherwise be made in defense of property in land. Mr. Carey's proposition, in its most obvious meaning, is equivalent to saying that if there were suddenly added to the lands of England an unreclaimed territory of equal natural fertility, it would not be worth the while of the inhabitants of England to reclaim it; because the profits of the operation would not be equal to the ordinary interest on the capital expended. To which assertion, if any answer could be supposed to be required, it would suffice to remark that land not of equal but of greatly inferior quality to that previously cultivated is continually reclaimed in England, at an expense which the subsequently accruing rent is sufficient to replace completely in a small number of years.

Professor Marshall, representing the later political economy, accepts the Ricardian theory in the main, but with some qualifications. He states his view thus ("Economics of Industry," bk. ii., chap. iii.):

Suppose a farmer to have £500 which he is thinking of applying in extra cultivation of his farm, and to have calculated that it will only just answer his purpose to do so. He has calculated, that is, that if he applies this extra £500 he will, after paying for labor, seed, taxes, etc., get an extra net produce of the value of £40; i. e., at the rate of 8 per cent on the extra outlay. This is, we suppose, just sufficient to remunerate him; so that if he expected to get less, the chance of the improvement turning out unsuccessful, and the prospect of additional trouble in working it, would induce him to invest the money in railroad stock or some other securities.

He hears at this time that a small adjacent farm of 50 acres is to let, and he is asked what rent he would be willing to pay for it. His £500 would be just enough for working this farm, and he could work it with the same trouble that it would give him to apply the extra £500 to the farm he already has. He calculates that taking one year with another he may expect to get from it £100 worth of net profit after paying for labor, seed, taxes, etc.

So he will pay just £60 rent for the use of this land. If he can get the land for this he will take it; but he will not give any more for it, and it will not be likely to be worth any one else's while to offer more. So the landlord cannot get more than this for it. If he puts up the farm to competition and plays off one farmer against another, he may just get £60; and this is then the competition rent, or, as it is sometimes called, the economic rent of the farm. Many disturbing circumstances, such as custom, the absence of an active spirit of competition on the part of the farmers, generosity or sluggishness on the part of the landlord may cause the actual rent to be less than this. But £60 is the rent that will be obtained if there is a perfectly good market for the hire of the land; that is, if on the one hand the landlord exerts himself to get the best rent he can for the land, and, on the other hand, there are competent men in the neighborhood who are ready to rent farms.

This illustration shows us that the economic rent of a piece of land is found by subtracting from the value of its annual produce an amount sufficient to return the farmer's outlay with profits.

Of course allowance must be made for the risk of bad harvests. This is done by assuming that the harvest is an average one. It must also be supposed that the farmer has neither more nor less skill and enterprise than most others in his neighborhood, or, as we may say, that he is an average farmer. The rent, then, is the surplus return which the land gives in an average harvest, after repaying the average farmer's outlay with profits, provided he has applied so much capital to it as to make this surplus return as large as he can. If he has applied less than this amount of capital some one else who intends to apply more than he has done, and thus obtain a larger surplus return, may offer to pay a higher rent.

Further, the above illustration shows that the amount of produce which a farmer must retain, in order to be remunerated for his outlay, can be discovered by observing what amount of additional return is just sufficient to induce him, or another farmer in the same neighborhood, to apply extra capital to his land.

It may happen that there is in the neighborhood land for which no rent can be obtained, because the return to the capital applied to this land remunerates, but only just remunerates, the farmer. In this case we may say that the amount of produce which a farmer must retain, in order to be remunerated for his outlay, is equal to the produce that could be raised by the same amount of capital from an adjacent piece of land that pays no rent, but yet is cultivated.

The law of rent may therefore be stated thus: The rent of a piece of land is the excess of its produce over the produce of an adjacent piece of land which is cultivated with an equal amount of capital, and which would not be cultivated at all if rent was demanded for it.

Of one important deduction from the Ricardian law of rent Professor Fawcett has made a clear explanation. He says ("Manual of Political Economy," bk. ii. chap. iii.):

From Ricardo's theory of rent there can be deduced the very important proposition, that rent is not an element of the cost of obtaining agricultural produce. A no less eminent writer than the late Mr. Buckle has assured his readers that the proposition just stated can only be grasped by a comprehensive thinker; we, however, believe that it may be made very intelligible by a simple exposition. If rent is not an element of cost of production, food would be no cheaper if all land were arbitrarily made rent free. Let us, therefore, inquire if this would be the case. It has been frequently stated in this chapter that there is always some land in cultivation so poor that it can only afford to pay a nominal rent; the produce it yields being no more than sufficient to reimburse the expenses of cultivation.

Let us now suppose that all land is made rent-free by an arbitrary edict of the government. Such an act of spoliation, altho it would unjustly interfere with property, would not cause any diminution in the consumption of food; the same quantity of agricultural produce would be required as before; the same area of land would, therefore, have to be cultivated. That land would still require to be tilled which previously only paid a nominal rent; but if food was rendered cheaper, by making land rent-free, this land, which before only paid nominal rent, would be cultivated at a loss. No person, however, will continue to apply his labor and capital if he does not obtain in return the ordinary rate of profit, and, therefore, if food became cheaper, such land as we have just described would cease to be cultivated; but this cannot be, because the demand of the country for food is such that the produce which this land yields cannot be dispensed with. It is therefore manifest that food would not become cheaper even if land were made rent-free. Rent consequently is not an element in the cost of production. The value of food is, *ceteris paribus*, determined by the demand for it, because the demand for food regulates the margin of cultivation. Altho the payment of rent does not influence the cost of producing food, yet the amount of rent paid indicates the position of the margin of cultivation, and the value of food must rise as this margin of cultivation descends.

(For the facts of modern rent and the important part played by rent in commercial and industrial life, and for land reforms, see articles EXPENDITURE; LAND; and SINGLE TAX.)

REPUBLICAN PARTY AND SOCIAL REFORM: A statement abridged from Mr. Roosevelt's principal messages to Congress, on social and industrial questions (Dec. 3, 1901, and Jan. 31, 1908), as coming from the accredited representative of the party, tho opposed on many points by not a few in his party.

As a nation we still continue to enjoy a literally unprecedented prosperity; and it is probable that only reckless speculation and disregard of legitimate business methods on the part of the business world can materially mar this prosperity.

In dealing with both labor and capital, with the questions affecting both corporations and trade-unions, there is one matter more important to remember than aught else, and that is the infinite harm done by preachers of mere discontent. These are the men who seek

to excite a violent class hatred against all men of wealth. They seek to turn wise and proper movements for the better control of corporations and for doing away with the abuses connected with wealth, into a campaign of hysterical excitement and falsehood in which the aim is to inflame to madness the brutal passions of mankind. In reality they are the worst enemies of the cause they profess to advocate, just as the purveyors of sensational slander in newspaper or magazine are the worst enemies of all men who are engaged in an honest effort to better what is bad in our social and governmental conditions. The one hope for success for our people lies in a resolute and fearless, but sane and cool-headed, advance along the path marked out last year by this very Congress.

Economic Rent

Capital and Labor

So far as it is in our power, it should be our aim steadily to reduce the number of hours of labor, with as a goal the general introduction of an eight-hour day. There are industries in which it is not possible that the hours of labor should be reduced; just as there are communities not far enough advanced for such a movement to be for their good, or, if in the tropics, so situated that there is no analogy between their needs and ours in this matter. But the wage-workers of the United States are of so high a grade that alike from the merely industrial standpoint and from the civic standpoint it should be our object to do what we can in the direction of securing the general observance of an eight-hour day. Half-holidays during summer should be established for government employees; it is as desirable for wage-workers who toil with their hands as for salaried officials whose labor is mental that there should be a reasonable amount of holiday.

More and more our people are growing to recognize the fact that the questions which are not merely of industrial but of social importance outweigh all others; and these two questions most emphatically come in the

**Industrial
Legislation**

category of those which affect in the most far-reaching way the home life of the nation. The horrors incident to the employment of young children in factories or at work anywhere are a blot on our civilization. It is true that each state must ultimately settle the question in its own way; but a thorough official investigation of the matter, with the results published broadcast, would greatly help toward arousing the public conscience and securing unity of state action in the matter.

The commission appointed by the president Oct. 16, 1902, at the request of both the anthracite coal operators and miners, to inquire into, consider, and pass upon the questions in controversy in connection with the strike in the anthracite regions of Pennsylvania and the causes out of which the controversy arose, in their report, findings, and award, express the belief "that the state and federal governments should provide the machinery for what may be called the compulsory investigation of controversies between employers and employees when they arise." This expression of belief is deserving of the favorable consideration of the Congress and the enactment of its provisions into law. A bill has already been introduced to this end.

It is not wise that the nation should alienate its remaining coal lands. I have temporarily withdrawn from settlement all the lands which the Geological Survey has indicated as containing, or in all probability containing, coal. The

Coal Lands

question, however, can be properly settled only by legislation, which in my judgment should provide for the withdrawal of these lands from sale or from entry, save in certain especial circumstances. The ownership would then remain in the U. S., which should not, however, attempt to work them, but permit them to be worked by private individuals under a royalty system, the government keeping such control as to permit it to see that no excessive price was charged consumers. It would, of course, be as necessary to supervise the rates charged by the common carriers to transport the product as the rates charged by those who mine it; and the supervision must extend to the conduct of the common carriers, so that they shall in no way favor one competitor at

the expense of another. The withdrawal of these coal lands would constitute a policy analogous to that which has been followed in withdrawing the forest lands from ordinary settlement. The coal, like the forests, should be treated as the property of the public and its disposal should be under conditions which would inure to the benefit of the public as a whole.

It cannot too often be repeated that experience has conclusively shown the impossibility of securing by the actions of nearly half a hundred different state legislatures anything but ineffective chaos in the way of dealing with the great corporations which do not operate exclusively within the limits of any one state. In some method, whether by a national license law or in other fashion, we must exercise, and that at an early date, a far more complete control than at present over these great corporations—a control that will among other things prevent the evils of excessive overcapitalization, and that will compel the disclosure by each big corporation of its stockholders and of its properties and business, whether owned directly or through subsidiary or affiliated corporations. The best way to avert the very undesirable move for the governmental ownership of railways is to secure by the government on behalf of the people as a whole such adequate control and regulation of the great interstate common carriers as will do away with the evils which give rise to the agitation against them.

The actual working of our laws has shown that the effort to prohibit all combination, good or bad, is noxious where it is not ineffective. Combination of capital like combination of labor is a necessary element of our present industrial system. It is not possible completely to prevent it; and if it were possible, such complete prevention would do damage to the body politic. What we need is not vainly to try to prevent all combination, but to secure such rigorous and adequate control and supervision of the combinations as to prevent their injuring the public, or existing in such form as inevitably to threaten injury—for the mere fact that a combination has secured practically complete control of a necessary of life would under any circumstances show that such combination was to be presumed to be adverse to the public interest.

The question of taxation is difficult in any country, but it is especially difficult in ours with its federal system of government.

**Inheritance
and
Income Tax**

Some taxes should on every ground be levied in a small district for use in that district. Thus the taxation of real estate is peculiarly one for the immediate locality in which the real estate is found. Again, there is no more legitimate tax for any state than a tax on the franchises conferred by that state upon street-railroads and similar corporations which operate wholly within the state boundaries, sometimes in one and sometimes in several municipalities or other minor divisions of the state. But there are many kinds of taxes which can only be levied by the general government so as to produce the best results, because, among other reasons, the attempt to impose them in one particular state too often results merely in driving the corporation or individual affected to some other locality or other state. The national government has long derived its chief revenue from a tariff on imports and from an internal or excise tax. In addition to these, there is every reason why, when next our

system of taxation is revised, the national government should impose a graduated inheritance tax, and, if possible, a graduated income tax. The man of great wealth owes a peculiar obligation to the State, because he derives special advantages from the mere existence of government. Not only should he recognize this obligation in the way he leads his daily life and in the way he earns and spends his money, but it should also be recognized by the way in which he pays for the protection the State gives him.

It would be impossible to overstate (tho it is of course difficult quantitatively to measure) the effect upon a nation's growth to greatness of what may be called organized patriotism, which necessarily includes the substitution of a national feeling for mere local pride; with as a resultant a high ambition for the whole country. No country can develop its full strength so long as the parts which make up the whole each put a feeling of loyalty to the part above the feeling of loyalty to the whole. It is probable that a thoroughly efficient system of education comes next to the influence of patriotism in bringing about national success of this kind. Our federal form of government, so fruitful of advantage to our people in certain ways, in other ways undoubtedly limits our national effectiveness. It is not possible, for instance, for the national government to take the lead in technical industrial education, to see that the public-school system of this country develops on all its technical, industrial, scientific, and commercial sides. This must be left primarily to the several states. Our industrial development depends largely upon technical education, including in this term all industrial education, from that which fits a man to be a good mechanic, a good carpenter, or blacksmith, to that which fits a man to do the greatest engineering feat. The skilled mechanic, the skilled workman, can best become such by technical industrial education.

In every possible way we should help the wage-worker who toils with his hands and who must (we hope in a constantly increasing measure) also toil with his brain.

The only other persons whose welfare is as vital to the welfare of the whole country as is the welfare of the wage-workers are the tillers of the soil, the farmers. It is a mere truism to say that no growth of cities,

Agriculture no growth of wealth, no industrial development can atone for any falling off in the character and standing of the farming population. During the last few decades this fact has been recognized with ever-increasing clearness. There is no longer any failure to realize that farming, at least in certain branches, must become a technical and scientific profession. This means that there must be open to farmers the chance for technical and scientific training, not theoretical merely but of the most severely practical type. The farmer represents a peculiarly high type of American citizenship, and he must have the same chance to rise and develop as other American citizens have.

Organization has become necessary in the business world; and it has accomplished much for good in the world of labor. It is no less necessary for farmers. Such a movement as the Grange movement is good in itself and is capable of a well-nigh infinite further extension for good so long as it is kept to its own legitimate business. The benefits to be derived by the association of farm-

ers for mutual advantage are partly economic and partly sociological.

Moreover, while in the long run voluntary effort will prove more efficacious than government assistance, while the farmers must primarily do most for themselves, yet the government can also do much. The Department of Agriculture has broken new ground in many directions, and year by year it finds how it can improve its methods and develop fresh usefulness. Its constant effort is to give the governmental assistance in the most effective way; that is, through associations of farmers rather than to or through individual farmers.

Much is now being done for the states of the Rocky Mountains and great plains through the development of the national policy of irrigation and forest preservation; no government policy for the betterment of our internal conditions has been more fruitful of good than this. The forests of the White Mountains and southern Appalachian regions should also be preserved; and they cannot be unless the people of the states in which they lie, through their representatives in the Congress, secure vigorous action by the national government.

I am well aware of how difficult it is to pass a constitutional amendment. Nevertheless, in my

Marriage and Divorce judgment the whole question of marriage and divorce should be relegated to the authority of the national Congress. At present the wide differences in the laws of the different states on

this subject result in scandals and abuses; and surely there is nothing so vitally essential to the welfare of the nation, nothing around which the nation should so bend itself to throw every safeguard, as the home life of the average citizen. The change would be good from every standpoint. In particular it would be good because it would confer on the Congress the power at once to deal radically and efficiently with polygamy; and this should be done whether or not marriage and divorce are dealt with. It is neither safe nor proper to leave the question of polygamy to be dealt with by the several states. Power to deal with it should be conferred on the national government.

Let me once again call the attention of the Congress to two subjects concerning which I have

American Shipping frequently before communicated with them. One is the question of developing American shipping. I trust that a law embodying in substance the views, or a major part of the

views, expressed in the report on this subject laid before the House at its last session will be passed. I am well aware that in former years objectionable measures have been proposed in reference to the encouragement of American shipping; but it seems to me that the proposed measure is as nearly unobjectionable as any can be. It will, of course, benefit primarily our seaboard states, such as Maine, Louisiana, and Washington; but what benefits part of our people in the end benefits all; just as government aid to irrigation and forestry in the West is really of benefit, not only to the Rocky Mountain states, but to all our country.

Currency Reform I especially call your attention to the second subject, the condition of our currency laws. The national bank act has ably served a great purpose in aiding the enormous business development of the country; and within ten years there has been an increase in circulation per capita from \$21.41 to \$33.08. For several years evi-

dence has been accumulating that additional legislation is needed. The recurrence of each crop season emphasizes the defects of the present laws. There must soon be a revision of them, because to leave them as they are means to incur liability of business disaster.

I most earnestly hope that the bill to provide a lower tariff for or else absolute free trade in Philippine products will become a law. No harm will come to any American industry; and while there will be some small but real material benefit to the Filipinos, the main benefit will come by the showing made as to our purpose to do all in our power for their welfare. So far our action in the Philippines has been abundantly justified, not mainly and indeed not primarily because of the added dignity it has given us as a nation by proving that we are capable honorably and efficiently to bear the international burdens which a mighty people should bear, but even more because of the immense benefit that has come to the people of the Philippine Islands. In these islands we are steadily introducing both liberty and order, to a greater degree than their people have ever before known.

American citizenship should be conferred on the citizens of Porto Rico.

We should as a nation do everything in our power for the cause of honorable peace. It is morally as indefensible for a nation to commit a wrong upon another nation, strong or weak, as for an individual thus to wrong his fellows. We should do all in our power to hasten the day when there shall be peace among the nations—a peace based upon justice and not upon cowardly submission to wrong.

Dec. 3, 1906.

The recent decision of the Supreme Court in regard to the employers' liability act, the experience of the Interstate Commerce Commission and of the Department of Justice in enforcing the interstate commerce and antitrust laws, and the gravely significant attitude toward the law and its administration recently adopted by certain heads of great corporations, render it desirable that there should be additional legislation as regards certain of the relations between labor and capital, and between the great corporations and the public.

The Supreme Court has decided the employers' liability law to be unconstitutional because its terms apply to employees engaged wholly in intrastate commerce as well as to employees engaged in interstate commerce. By a substantial majority the court holds that the Congress has power to deal with the question in so far as interstate commerce is concerned.

As regards the employers' liability law, I advocate its immediate reenactment, limiting its scope so that it shall apply only to the class of cases as to which the court says it can constitutionally apply, but strengthening its provisions within this scope. Interstate employment being thus covered by an adequate national law, the field of intrastate employment will be left to the action of the several states. With this clear definition of responsibility the states will undoubtedly give to the performance of their duty within their field the consideration the importance of the subject demands.

I also very urgently advise that a comprehensive act be passed providing for compensation by the government to all employees injured in the government service. Under the present law an

injured workman in the employment of the government has no remedy, and the entire burden of the accident falls on the helpless man, his wife, and his young children. This is an outrage. It is a matter of humiliation to the nation that there should not be on our statute-books provision to meet and partially atone for cruel misfortune when it comes upon a man through no fault of his own while faithfully serving the public.

The same broad principle which should apply to the government should ultimately be made applicable to all private employers.

I again call your attention to the need of some action in connection with the abuse of injunctions in labor cases. As regards the rights and wrongs of labor and capital, from blacklisting to boycotting, the whole subject is covered in admirable fashion by the report of the Anthracite Coal Strike Commission, which report should serve as a chart for the guidance of both legislative and executive officers. As regards injunctions, I can do little but repeat what I have said in my last message to the Congress. Even tho it were possible, I should consider it most unwise to abolish the use of the process of injunction. It is necessary in order that the courts may maintain their own dignity and in order that they may in effective manner check disorder and violence. The judge who uses it cautiously and conservatively, but who, when the need arises, uses it fearlessly, confers the greatest service upon our people, and his preeminent usefulness as a public servant should be heartily recognized. But there is no question in my mind that it has sometimes been used heedlessly and unjustly, and that some of the injunctions issued inflict grave and occasionally irreparable wrong upon those enjoined.

It is all wrong to use the injunction to prevent the entirely proper and legitimate actions of labor organizations in their struggle for industrial betterment, or under the guise of protecting property rights unwarrantably to invade the fundamental rights of the individual. It is futile to concede, as we all do, the right and the necessity of organized effort on the part of wage-earners and yet by injunctive process to forbid peaceable action to accomplish the lawful objects for which they are organized and upon which their success depends.

Not only should there be action on certain laws affecting wage-earners; there should also be such action on laws better to secure control over the great business concerns engaged in interstate commerce, and especially over the great common carriers. The Interstate Commerce Commission should be empowered to pass upon any rate or practise on its own initiative. Moreover, it should be provided that whenever the commission has reason to believe that a proposed advance in a rate ought not to be made without investigation, it should have authority to issue an order prohibiting the advance pending examination by the commission.

I would not be understood as expressing an opinion that any or even a majority of these advances are improper. Many of the rates in this country have been abnormally low. The operating expenses of our railroads, notably the wages paid railroad employees, have greatly increased. These and other causes may in any given case justify an advance in rates, and if so the advances should be permitted and approved. But there may be, and doubtless are, cases where this is not true; and our law should be so framed

that the government, as the representative of the whole people, can protect the individual against unlawful exaction for the use of these public highways. The Interstate Commerce Commission should be provided with the means to make a physical valuation of any road as to which it deems this valuation necessary. In some form the federal government should exercise supervision over the financial operations of our interstate railroads. In no other way can justice be done between the private owners of those properties and the public which pay their charges.

I think that the federal government must also assume a certain measure of control over the physical operation of railways in the handling of interstate traffic. The commission now has authority to establish through routes and joint rates. In order to make this provision effective and in order to promote in times of necessity the proper movement of traffic, I think it must also have authority to determine the conditions upon which cars shall be interchanged between different interstate railroads. It is also probable that the commission should have authority, in particular instances, to determine the schedule upon which perishable commodities shall be moved.

In this connection I desire to repeat my recommendation that railways be permitted to form traffic associations for the purpose of conferring about and agreeing upon rates, regulations, and practises affecting interstate business in which the members of the association are mutually interested. This does not mean that they should be given the right to pool their earnings or their traffic. The law requires that rates shall be so adjusted as not to discriminate between individuals, localities, or different species of traffic. Ordinarily, rates by all competing lines must be the same. As applied to practical conditions, the railway operations of this country cannot be conducted according to law without what is equivalent to conference and agreement. The articles under which such associations operate should be approved by the commission; all their operations should be open to public inspection; and the rates, regulations, and practises upon which they agree should be subject to disapproval by the commission.

I urge this last provision with the same earnestness that I do the others. This country provides its railway facilities by private capital. Those facilities will not be adequate unless the capital employed is assured of just treatment and an adequate return. In fixing the charges of our railroads, I believe that, considering the interests of the public alone, it is better to allow too liberal rather than too scanty earnings, for, otherwise, there is grave danger that our railway development may not keep pace with the demand for transportation. But the fundamental idea that these railways are public highways must be recognized, and they must be open to the whole public upon equal terms and upon reasonable terms.

Jan. 31, 1908.

THEODORE ROOSEVELT.

REVENUE: For the principles involved in problems of revenue, see **FINANCE**; **TAXATION**; **FREE TRADE**; **PROTECTION**; **SOCIALISM**; **STATE**.

REVIVAL OF HANDICRAFTS: Varied efforts are being made to-day to revive the production of articles of a more or less artistic nature by hand instead of by machinery. Manufacture was almost entirely by hand, supplemented by tools,

until the introduction of steam. The latter made possible the replacing of the hand as the principal tool and propelling power by machinery. Manufacture became machinofacture. Production became immensely prolific and enabled many people to enjoy comforts which had been denied to them before. But it also repressed the individuality of the maker, who really became merely a machine to watch and operate another machine. The pride, the satisfaction, and the creative sense in one's own product was largely gone. In order to reintroduce the personal element into the making of semi-artistic articles, a movement has been started in nearly every civilized country for teaching, fostering, and encouraging handicrafts along numerous lines.

The crafts which are taken up are chiefly those in which machinery cannot compete successfully, e. g., rug- and carpet-weaving, lace-making, basketry, ceramics, wood and metal work, sloyd, printing and binding of books in *éditions de luxe*, cabinet-making, decorating, house-painting, etc.

The movement in England was started chiefly through the influence of John Ruskin and William Morris. The latter says: "To give people pleasure in the things they must perforce use, that is one great office of decoration; to give people pleasure in the things they must perforce make, that is the other use of it." Ruskin held that a man should use his brains as well as his hands in whatsoever he produced, which implies in crafts the ability to design and create new models, and thus to impress one's individuality upon the product and express one's personality in it. Only in that way can the mechanical operation of the hand be raised into the realm of the spiritual, and personality developed instead of disintegrated. Ruskin (*q. v.*) started the Society of St. George with the promotion of handicrafts as one of its objects. The trade-schools (*q. v.*) have now taken up this matter to a large extent. The Sloyd Association of Great Britain and Ireland (131 Percy Road, Shepherd's Bush, London, W.) has similar aims.

The most conspicuous attempt in reviving handicrafts has, however, been made in Ireland, and partly in England, for the Irish. The Gaelic League, founded in 1893, has made this endeavor one of its objects. By reviving the crafts and the house industries, particularly in the country districts, the league hopes to give congenial employment to boys and men during the winter and to women all the year round. If successful, this arrangement will operate reciprocally—in diminishing idleness in the country districts, and in providing a market for farm products. Thus both consumption and production will be affected advantageously. In order to create a market for these products, particularly the lace and linen, the league has arranged an annual exhibition of Irish goods in London with a permanent center at 26 Ludgate Hill. Ever since, there has been a ready market for these goods, and many formerly poor families now make a comfortable living. Beside this economic advantage has been a political advantage. The revival of craftsmanship has taught the north and the south of Ireland that their problem is ultimately the same.

On the Continent the movement finds expression chiefly in the *Gewerbe- und Kunstschulen* of Germany, which have been taken as models by other countries, and by permanent exhibits, e. g., in Nuremberg and in Vienna. In the latter city

Dr. Vetter has succeeded in creating a very excellent trade and crafts museum, while the products of the different crown lands, peculiar to each, are exhibited and find ready purchasers. This ready market, again, stimulates the craftsmen and women to higher and nobler efforts, and thus a signal service is rendered to numerous people, not only economically but artistically, especially since some artists of note have taken a lively interest in the matter by giving instruction in drawing and designing, and furnishing samples of superior workmanship.

The French Chamber in 1906 set aside the sum of 10,000 francs for an investigation concerning ways and means by which the house industries in country districts may be saved from ruin, how new ones may be created, and thus idleness and poverty be obviated. This is in addition to what is being done in the trade-schools. Belgium is trying her best to foster lace-making and other house industries which require skill and originality.

In the United States a strong tendency has been shown in recent years toward reviving and fostering craftsmanship. Perhaps most prominent in this respect is the domestic weaving and rug-making, in villages and countrysides both in New England and the Appalachian Mountains, where some women have preserved their secret of weaving and dyeing rugs of exceptional beauty. Among the Scandinavians of the West there are also some women who have not forgotten their skill in this line. The revival has been due in the southern mountains chiefly to philanthropic efforts; in New England to summer boarders of artistic taste and lovers of the unconventional. Hardly more than the principal places can be mentioned in this article. The Acadians in the Attakapas region of southern Louisiana make blankets and cottonade suitings. The Log Cabin settlement near Asheville, N. C., has encouraged chiefly the weaving of coverlets. The Allanstand Cottage Industries in Madison, N. C., have revived an industry among the mountaineers which provides a comfortable living for them. The Berea Fireside Industries in Kentucky have rehabilitated the art of dyeing and weaving in that neighborhood. Similar industries exist now in Russellville, Tenn., Proctor, Ky., Hindman, Ky., Rome, Ga. In New England rug-making was revived first at Pequaket, N. H., by Mrs. Helen R. Albee, a designer. The Sabatos rugs of Center Lovell, Me., have found favor with artists in New York City. The Cranberry Isles, Me., Belchertown, Mass., Plainfield, N. H., have also experienced a revival of their house industry of rug-making. The Charity Society of New York City and Grace Church Hospital for old people have given employment to people at rug-making. There are a large number of other places where successful attempts have been made in this direction. Among these the Roycroft Shop, at East Aurora, N. Y., is, perhaps, the most prominent.

An interesting innovation in this line has been introduced at Hull House, Chicago, in 1900. A museum showing various handicrafts in their process of evolution was established, and the various nationalities in the neighborhood were asked to bring their distaffs, spinning-wheels, looms, etc., in order to furnish an opportunity for comparisons both as to implements and processes of spinning, weaving, etc. Thus a number of fabrics and rugs were produced representing Greeks, Irish, Italians, Syrians.

Weaving on hand-loom has been introduced into the curricula of several industrial schools, e. g., at Hampton Institute, Hampton, Va., for rugs, table-covers, portières, etc. A class in dyeing from vegetable dyes has also been introduced. The Teachers' College, New York City, Newcomb College, New Orleans, the Home Industrial School, Asheville, N. C., are also giving classes in rug-weaving. Even two elementary schools, the Dewey School at Chicago, and the Motley School, Minneapolis, are giving courses in textile handicrafts.

Rug-weaving is only a part of a larger movement. There has been a tendency since 1875 in the direction of hand-made goods. Wood-carving, overglaze china painting, pottery, were the first crafts to attract attention, particularly in Cincinnati, where several clubs were started with good results, and where the Art Academy is doing excellent work. Chicago followed this example in the "nineties" with various clubs devoting themselves to the acquirement of skill and dexterity in numerous lines. Since 1900 Boston, New York City, Syracuse, Baltimore, Philadelphia, Dayton, Ohio, Indianapolis, and many smaller places have formed clubs for giving men and women opportunities to perfect themselves in one or more crafts. Byrdcliffe, Woodstock, N. Y., deserves special mention. It is a summer art school for various crafts, but the intention of Mr. Ralph Radcliffe-Whitehead, the founder, is to establish a permanent art village. Even stock companies have been formed for the promotion of crafts, e. g., at Glen Eirie, Saugerties, N. Y.

Hand in hand with this movement has gone that for the preservation of handicrafts among the Indians, and among the natives of Porto Rico. Basketry, bead-work, blanket-weaving among the Indians is receiving special attention at several reservations and from a number of associations, e. g., the Mohonk Lodge, Sequoia League, Basket Fraternity, etc.

The movement is now in full swing, and is benefiting a large number of people economically, artistically, and socially. If it is to succeed, the crafts must give scope to native genius and esthetic sense. What militates against it is the disappearance of national costumes through the leveling influence of modern fashions, which consider only him or her as being within the pale of civilization who is dressed more or less in some imitation of Paris models. America is the greatest sinner in this respect; it is, consequently, a hopeful sign that she has taken up the movement so vigorously.

A list of the more important arts and crafts clubs and societies in the U. S. follows:

- Chicago Arts and Crafts Society, 1301 Woman's Temple, Chicago.
- Society of Arts and Crafts, 9 Park Street, Boston, Mass.
- Arts and Crafts Society, Deerfield, Mass.
- Hingham Society of Arts and Crafts, Hingham, Mass.
- Greenfield Arts and Crafts Society, Greenfield, Mass.
- New Clairvaux Arts and Crafts Society, Montague, Mass.
- Guild of Arts and Crafts, 109 East Twenty-third Street, New York.
- Society of Arts and Crafts, 323 North Charles Street, Baltimore, Md.
- Malden Arts and Crafts Society, Malden, Mass.
- Brewster Guild of Arts and Crafts, Brewster, Mass.
- Southampton Arts and Crafts, Southampton, Mass.
- Dorchester Arts and Crafts Society, Dorchester, Mass.
- Society of Arts and Crafts, Grand Rapids, Mich.
- Arts and Crafts Club of St. Louis, Mo., 33 Linmar Building.
- Arts and Crafts Society, Dayton, Ohio, 500 East Second Street.
- Center Lovell Handicraft Society, Center Lovell, Me.

Arts and Crafts Society, Minneapolis, Minn., 1321 Laurel Avenue.
Arts and Crafts Club, Fargo, N. Dak.
Arts and Crafts Club, Hartford, Conn., 205 Trumbull Street.
Arts and Crafts Club of Bradley Polytechnic Institute, Peoria, Ill.
Society of Arts and Crafts, Exeter, N. H.
Arts and Crafts Society of St. Joseph, Mo.
Guild of Arts and Crafts of California, 639 Kearny Street, San Francisco.
Arts and Crafts Association, Fitchburg, Mass.
Hamilton Arts and Crafts Club, Hamilton, N. Y.

REVISIONISTS, THE: The constructive wing of the Social-Democratic Party of Germany. It comprizes a brilliant array of writers, political representatives, and trade-union leaders. Besides Eduard Bernstein and George von Vollmar, we find Carl Legien, Adolph von Elm, Ignatz Auer (the party secretary), A. Hue, Wolfgang Heine, Paul Kampfmeyer, and many others.

The Revisionists accept the doctrines of Marx as the basis of their economic and political activity. But they also hold that the theories of Marx need revision in many vital respects.

They declare that, especially in the field of agriculture, Marx's prediction of the concentration of wealth and the wiping out of the middle class has not been verified by the economic development. They also find fault with Marx's theory of value in some points, and furthermore contend that while the old middle class is disappearing, a new middle class, made up of well-paid foremen, superintendents, bookkeepers, managers, etc., is taking its place.

They deny the "catastrophe" theory that socialism will be introduced some day at one bound by a "coup de force" and contend that socialism is simply a matter of *evolution*—a contention which they can easily prove from the writings of Marx, Engels, and some of their successors.

The Revisionists, therefore, while they in no way try to hide their ultimate aim of establishing the so-called Socialist Republic, lay the main stress on practical and immediate ameliorative work. And while they do not reject the revolution—or as many revolutions, for that matter, as the evolution of economic and political conditions may bring about—yet they claim that the work in the trade-unions, in the cooperative societies, and in the political field is of *paramount importance* for the working class at the present time. Their theory was formulated by Eduard Bernstein.

In reality, the difference between them and the other wing of the Social-Democratic Party is simply a struggle between the evolutionary principle in its widest sense and the revolutionary principle in its narrowest meaning.

That struggle has been apparent in Germany from the very beginning of the movement.

The German Social Democracy was originally formed of two divided and hostile camps—the Lassalleans and the Eisenachers (Marxists). The Lassalleans were the more fanatic and more "radical" in their ways, but less scientific and less radical in their theories. As a matter of fact, the Lassalleans were rather national than international. After many bitter fights and squabbles with each other, the two great groups were united by political persecutions and welded together by the anti-Socialist laws. At the time of this union the Lassalleans were far stronger in numbers, but

they succumbed to the theoretic basis of the Marxists. To-day the German Social-Democratic Party is Marxist and international.

Marxism in itself is revolutionary and evolutionary. Or more correctly exprest, it is based on the economic evolution, which is essentially revolutionary and is revolutionizing the world before our eyes.

Now, when the German Socialist movement was young, that is, in the sixties and seventies of the nineteenth century, the matter was understood quite differently. German proletarian leaders had seen and experienced the betrayal of the revolution and of political freedom by the bourgeois in France and Germany in 1848.

The proletarian idea then was that the awakened proletariat must complete the unfinished work of the bourgeois. The proletariat must finally win democracy, freedom, and equality for Germany. But at the same time it also must take a great step forward, and to the political add the economic emancipation—that is, besides a democratic constitution, it must also create the Socialist Republic.

All this must be attained by one single political revolutionary stroke—by winning one great battle, possibly on the barricades. The Socialists of that day scoffed at parliamentarism.

John Most and Wilhelm Hasselmann were the logical exponents of this view. Yet even Liebknecht protest it at one time.

This idea changed perceptibly at the time of the anti-Socialist laws. The twelve years of persecution gave the Socialists an idea of the tremendous power of the ruling classes and of the strength of capitalist society. The thinking people in the party came to see that the present economic system was still far too strong to be overthrown by one single revolutionary eruption. They found that it was impossible with one blow to bring the economic and the political revolution.

The leaders of the party, therefore, took very good care to warn the masses against revolutionary outbreaks, in order not to give the ruling class the desired opportunity to make use of their power. Under no consideration must the unarmed masses be brought before the "magazine rifles," by which the dearest wish of the reactionists would be fulfilled.

Thus under the anti-Socialist law the *evolutionary* principle naturally came more and more into favor. The party very wisely trusted to the development of economic affairs.

After the abolition of the anti-Socialist laws a small portion of the party, especially students and so-called "intellectuals" were ready to return to the "old revolutionary tactics." This was the faction of the so-called "Young Men" (*Die Jungen*), led by Wildberger and Werner.

Another group with George von Vollmar, a former ultra-revolutionist, represented the evolutionary principle. While the "final aim"—the abolition of wage-labor—was not to be denied, *main stress* must be laid upon *present* political and social reforms.

The third and strongest group took a middle ground, and was led at that time by Liebknecht, Bebel, and Singer.

The clash came at the conventions at Halle in 1890 and at Erfurt in 1891. Liebknecht and Bebel conquered. Wildberger, Werner, and some other "revolutionists," who were unwilling to submit, withdrew from the party and became anarchists. Vollmar and his evolutionary

group remained in the ascendancy and were very active.

Yet the two tendencies continued to clash in the German Social Democracy. This has been noticeable at every convention. And since Bernstein wrote his famous book, they have also had a theoretical standard around which to rally.

The issues have been various. Sometimes labor-unions were discusst, sometimes an agrarian program, or participation in the Prussian Landtag elections. Then again purely theoretic questions were raised by Eduard Bernstein—theories overthrown as to the progress of misery and its relation to the Socialist movement. Exceptions were also taken to the Marxian theory of concentration as far as agriculture was concerned. Of late the question of the general strike has been discusst. The Revisionists favored it under certain conditions, but not to the exclusion of all other tactical means.

The key-note was always the evolutionary principle in its widest sense against the revolutionary principle in a narrow conception.

At first the representatives of the constructive tendency, except Bernstein, Auer, and Legien, were young men with a university education, many of whom have paid positions in the party and therefore had to take pains not to offend party traditions and party prejudices. And the reproach was made that they were "intellectuals," not real proletarians with a "callous fist," and this was given by their opponents as the reason why they were not "revolutionary." It was also unfortunate that Eduard Bernstein, the man who in 1898 took up the theoretic side of the question in the *Neue Zeit*, and from whom the faction very incorrectly has received its name, is anything but a practical statesman and still less a leader of the masses. But since most of the trade-union leaders and the adherents of the co-operative societies have accepted Bernstein's theories, this has changed the situation.

The struggle between the two principles will continue in future. But a split in the great German Social Democracy is out of the question. The sound sense and fine discipline of the German organized working men will prevent this, and so will the conduct of their opponents. Moreover, a victory of the evolutionary principle will not mean any weakening, but rather a strengthening, of the position of the working class. It will make the gradual but steady development of the German working class its main business, without giving up the idea of the revolution.

The result of the last election in Germany has shown that the Social-Democratic Party can no longer keep up its mainly negative program and make headway. Compared with the Socialists of France, of England, and even of Italy, the German Social Democracy, in spite of its grand organization and discipline, has played a small rôle. What it has achieved for the working class was done rather in a negative way, the ruling class fearing the ascendancy of the revolution, than by any positive program. An absolute change of attitude may be more difficult in Germany than in any other country, on account of the personality of the kaiser, who is very antidemocratic. But a way will have to be found to utilize the genius of the Social Democracy for the people now and in the future. We do not want to postpone its usefulness until some indefinite time.

The Revisionists were beaten by a good ma-

jority at the Social-Democratic convention in Lübeck (1901) and were censured and forbidden to promulgate their theories. They were beaten again at the Dresden convention in 1903. But *ideas* cannot be suppress in such a crude way, otherwise socialism would have been crusht long ago. And especially the idea of the Revisionists ("Bernsteinism"), which represents a principle that has striven for the supremacy in the German Socialist movement since its very inception, cannot be suppress by a simple majority vote of a party congress. It has taken deep roots among the trade-unionists of Germany. The work in the municipalities helps it along. It brings the party in close touch with the people. In short, the economic-revolutionary principle—which, by the way, does not exclude so-called revolutionary exploits, but rather includes them—is the best legacy of Carl Marx to his followers. Therefore it is bound to win.

VICTOR L. BERGER.

REYBAUD, MARIE ROCHE LOUIS: Historian; born Marseilles, 1799. He went to Paris in 1829, and became the leading historian of the Socialist school. Novelist as well as historian, in 1850 he was elected a member of the Academy. His "*Études sur les réformateurs ou socialistes modernes*" (2 vols., 1840-47) was the first work to bring the word socialism into general use. Died 1879.

REYNOLDS, JAMES BRONSON: Social reform worker; born 1861, Kiantone, N. Y.; educated at North Haven and New Haven; graduated from Yale University, 1884; Yale Divinity School, 1888; afterward did postgraduate work in Paris and Berlin; was fellow in sociology at Columbia University; law student at New York University. As official representative of the College Young Men's Christian Association, he visited Great Britain and the Continent from 1889-92, studying at the same time social problems. Member Committee of Seventy, 1893. In 1894 he became head worker of the University Settlement in New York. In that position he was member of a number of committees, e. g., City Club's committee to prepare for campaign of 1897; chairman of executive committee of Citizens' Union, etc. In 1900 Governor Roosevelt appointed him a member of the State Tenement House Commission; 1902-3 he was secretary to Mayor Low of New York; afterward went to Washington, D. C., as special adviser to President Roosevelt on municipal affairs of Washington; 1906 he was a member of the presidential commission to investigate the Chicago stock-yards. Member of numerous clubs: Address: The Century Association, 7 West Forty-third Street, New York City, U. S. A.

RICARDO, DAVID: Political economist; born in London, 1772, the son of a Jewish member of the Stock Exchange. At the age of fourteen he entered his father's office; but, when twenty-one, he separated from his father's family and entered the Church of England. Commencing business for himself, he was a man of wealth at twenty-five. In 1799 became interested in Adam Smith's great work, and henceforth devoted himself mainly to economic studies. In 1809 he wrote a series of articles on monetary questions to the *Morning Chronicle*, which led to considerable controversy. In 1815 he published an essay on the influence of

the "Low Price of Corn, or the Profit of Stock," in which he first stated the views as to rent afterward connected with his name, but which he explicitly states he derived mainly from Malthus (see RENT). In 1817 appeared Ricardo's great work, his "Principles of Political Economy and Taxation." In 1819 he entered Parliament, and was soon recognized as an authority in economics, and a strong supporter of the battle for free trade. In 1822 he published a tract on "Protection to Agriculture," and in 1824 was published, after his death, his "Plan for the Establishment of a National Bank." Ricardo died Sept. 11, 1823, James Mill saying of him that he knew not a better man.

Professor Ingram ("History of Political Economy"), says of Ricardo's views:

The principle which he puts first in order, and which is indeed the key to the whole, is this—that the exchange value of any commodity, the supply of which can be increased at will, is regulated, under a regime of free competition, by the labor necessary for its production. Similar propositions are to be found in the "Wealth of Nations," not to speak of earlier English writings. On this basis Ricardo goes on to explain the laws according to which the produce of the land and the labor of the country is distributed among the several classes which take part in production. (Professor Ingram shows where Ricardo got his theory of rent, and then says:)

The essence of the theory is that rent, being the price paid by the cultivator to the owner of land for the use of its productive powers, is equal to the excess of the price of the produce of the land over the cost of production on that land. With the increase of population, and therefore of demand for food, inferior soils will be taken into cultivation; and the price of the entire supply necessary for the community will be regulated by the cost of production of that portion of the supply which is produced at the greatest expense. But for the land which will barely repay the cost of cultivation, no rent will be paid. Hence, the rent of any quality of land will be equal to the difference between the cost of production on that land and the cost of production of that produce which is raised at the greatest expense.

The great importance of the theory of rent in Ricardo's system arises from the fact that he makes the general economic condition of society to depend altogether on the position in which agricultural exploitation stands. This will be seen from the following statement of his theory of wages and profits.

Ricardian Law of Rent

The produce of every expenditure of labor and capital being divided between the laborer and the capitalist, in proportion as one obtains more the other will necessarily obtain less. The productiveness of labor being given, nothing can diminish profit but a rise of wages, or increase it but a fall of wages. Now, the price of labor, being the same as its cost of production, is determined by the price of the commodities necessary for the support of the laborer. The price of such manufactured articles as he requires has a constant tendency to fall, principally by reason of the progressive application of the division of labor to their production. But the cost of his maintenance essentially depends not on the price of those articles, but on that of his food; and, as the production of food will in the progress of society and of population require the sacrifice of more and more labor, its price will rise; money wages will constantly rise, and with the rise of wages profits will fall. Thus it is to the necessary gradual descent to inferior soils, or less productive expenditure on the same soil, that the decrease in the rate of profit which has historically taken place is to be attributed (Smith ascribed this decrease to the competition of capitalists, tho in one place, book i., chap. ix., he had a glimpse of the Ricardian view). This gravitation of profits toward a minimum is happily checked at times by improvements of the machinery employed in the production of necessities, and especially by such discoveries in agriculture and other causes as reduce the cost of the prime necessary of the laborer; but here again the tendency is constant. While the capitalist thus loses the laborer does not gain; his increased money wages only enable him to pay the increased price of his necessities, of which he will have no greater and probably a less share than he had before. In fact, the laborer can never for any considerable time earn more than what is required to enable the class to subsist in such a degree of comfort as custom has made indispensable to them, and to perpetuate their race without either increase or diminution. That is the "natural" price of labor; and if the market-rate temporarily rises above it, population will be stimulated, and the rate of wages will again fall. Thus, while rent has a constant tendency to rise and profit to fall, the rise or fall of wages will depend on the rate of increase of the working classes. For the improvement of their condition, Ricardo thus has to fall back on the Malthusian remedy, of the effective application of which he does not,

however, seem to have much expectation. The securities against a superabundant population to which he inclines are the gradual abolition of the poor-laws—for their amendment would not content him—and the development among the working classes of a taste for greater comforts and enjoyments.

It will be seen that the Socialists have somewhat exaggerated in announcing, as Ricardo's "iron law" of wages, their absolute identity with the amount necessary to sustain the existence of the laborer and enable him to continue the race. He recognizes the influence of a "standard of living" as limiting the increase of the numbers of the working classes, and so keeping their wages above the lowest point. But he also holds that, in long-settled countries, in the ordinary course of human affairs, and in the absence of special efforts restricting the growth of population, the condition of the laborer will decline as surely, and from the same causes, as that of the landlord will be improved.

RICHARDS, T.: Member British Parliament, of Labor Party for West Monmouthshire; born 1859 at Beaufort, Monmouthshire. Worked in a mine and became agent of the Ebbw Vale Company's Workmen in 1888. He is general secretary for South Wales and Monmouth of the Miners' Federation, and a member of the County Council for Monmouthshire; was chairman of the Ebbw Vale District Council in 1895. He was elected to Parliament in 1904, and returned in 1906 Breconshire unopposed. Address: Tycend, Beaufort, Monmouthshire, England.

RICHARDS, THOMAS FREDERICK: Member British Parliament, of Labor Party for Wolverhampton, West; born 1863 at Wednesbury; received but a scanty education since he had to go to work at the age of twelve, owing to his father's death; worked in various trades until 1882, when he was apprenticed to a boot- and shoemaker at Leicester. He was elected successively vice-president, 1894, and president, 1897, of the Leicester No. 1 Branch. He was delegate to the Cooperative Congress at Birmingham in 1906 from the Trade-Union Congress at Leeds. His party elected him town councilor in 1894 and successively for nine years. In his party he took an active interest in the Federation of Trade-Unions, and was a member of the management committee. He has been an active Socialist since 1887. Elected to Parliament 1906. Address: 115 Knollys Road, Streatham, S. W., London.

RICHARDSON, ARTHUR: Labor member British Parliament for Nottingham, South; born 1860; educated at the national school at East Bridford and the grammar school at Newark-on-Trent. He was apprenticed to a grocer in 1877, and later bought the business of E. Swan & Co., Nottingham. He was elected to Parliament by the Labor vote in 1906. Address: 6 Friar Yard, Nottingham, England.

RICHTER, J., DR.: Privy Councillor of the Imperial German Home Office; born 1856, at Königsberg, Germany. He devoted himself to the study of the law; became a referendar in 1879 and in 1886 was appointed assessor. In this capacity he entered the government of the Province of Posen. During his five official years in Posen he engaged in all the branches of administrative business, particularly with social-political questions. Called in 1891 to the Imperial Home Office, he was made Government Councillor in 1892, a reporting privy councillor in 1895, and in 1898 became a chief privy councillor. Dr. Richter is employed in the most varied business of the Home Office at Berlin, but to the public he is chiefly known by his connection with the great

Wages and Profit

price of labor; and if the market-rate temporarily rises above it, population will be stimulated, and the rate of wages will again fall. Thus, while rent has a constant tendency to rise and profit to fall, the rise or fall of wages will depend on the rate of increase of the working classes. For the improvement of their condition, Ricardo thus has to fall back on the Malthusian remedy, of the effective application of which he does not,

expositions. He was Representative Commissioner of Germany at the Chicago Columbian Exposition. Imperial Commissioner for the Paris International Exposition in 1896. Since his return from Paris he has been principally occupied in the field of social politics, having been entrusted with the task of organizing into practical efficiency the various agencies, methods, and endeavors which are seeking to provide healthy and suitable dwellings at moderate prices for workmen and clerks with small salaries. *Address:* The Imperial Home Office, Berlin, Germany.

RIGHT RELATIONSHIP LEAGUE, THE: Organized in Chicago, Ill., 1898, largely through the efforts of E. P. Keyes. Its aim, as stated in its charter, is "to study, teach, and promote cooperation," but it uses cooperation in the largest sense and believes that this is only the first step in introducing right relationship in all matters—the "coming kingdom" of justice and equality in ownership, responsibility, authority, and privilege. It is organized without capital, not for profit, but for service.

It works on an especial form of cooperation which it considers "true cooperation": the equal ownership of stock (with shares at \$100); stockholders to vote without proxies, "one man one vote"; all business on a cash basis or product of labor; goods sold at market prices; net profits to be divided annually "among the members according to the amount of their individual patronage," after 8 per cent has been paid on shares and a fixed percentage for a reserve fund, education, and depreciation. Under its auspices some fifty stores have been established or have joined the league, mainly in Michigan, Wisconsin, Illinois, Ohio, and Minnesota, and the president reports them to be prospering in 1907. Also under its auspices a cooperative merchants' company has been formed, the purpose of which is stated by Miss Helen L. Sumner ("Labor Problems," p. 406) to be: "To form county organizations, which shall buy out already existing stores and shall employ as manager the former owner, consolidating different kinds of stores into departments under one general management and obtaining branches in other towns of the county as rapidly as possible. The stores bought are to be paid for in shares of the cooperative company, but all shares above \$100 are to be deposited and held in trust until purchased by non-members."

This company now supplies goods as a wholesale house to some 200 cooperative merchants. The present membership in the league is about 150, tho the president states that the league is not very active at present through the difficulty of securing the right workers. He reports the plan, however, to bring work, and to be slowly making headway. *President,* J. Burnett Swett; *secretary,* Clara J. Biddell, 427 Reaper Block, Chicago, Ill.

RIIS, JACOB AUGUST: Sociological writer and reformer; born in Ribe, Denmark, 1849. Coming to New York, he became a reporter on the *New York Sun*, and through this acquainted with the conditions on the East Side, which he has tellingly described, and which he has done so much to reform in the books which have given him his fame. Interested especially in housing and tenement reform, he was (1897) secretary of the New York Small Parks Commission, and 1896-97

executive officer of the Good Government Clubs. Since then he has mainly confined his efforts to the pen. Mr. Riis has said that he professes no other political or social economy than this—to so better the housing, the schools, and the whole environment of the tenement house population, whose influences make for unrighteousness, that the generation to come shall be able to choose their own political economy intelligently and righteously. Among Mr. Riis's best known books are: "How the Other Half Lives" (1890); "The Children of the Poor" (1892); "The Making of an American" (1901); "The Battle with the Slum" (1902); "The Peril and the Preservation of the Home" (1903); "Theodore Roosevelt, the Citizen" (1904). *Address:* 524 North Beech Street, Richmond Hill, N. Y.

RITCHIE, DAVID G.: Born Jedburgh, Scotland, 1853, and received his school education there. Graduated with honors from the University of Edinburgh, 1874, he entered Balliol College, at Oxford, attending, among other lectures, those of Prof. T. H. Green. He was elected to an open fellowship in Jesus College, and since 1879 has been college lecturer and tutor in logic.

In politics Professor Ritchie was a radical, largely favoring State socialism.

Author: "Darwinism and Politics"; "Essays on Human Evolution"; "The Principles of State Interference"; "Four Essays on the Political Philosophy of Mr. Herbert Spencer, J. S. Mill, and T. H. Green"; "Darwin and Hegel"; with other philosophical studies and many review articles and essays. Died in 1903.

ROADS: The importance of good roads to a community is evident, tho not always remembered. Traffic, industry, communication, are dependent upon them.

The roads of the Roman Empire were expensive and have endured, but can be improved upon by modern engineering. Twenty-nine military roads centered at Rome, and had, according to Antoninus, a total length of 52,964 Roman miles. Ancient Peru and Mexico had good roads. In the Middle Ages roads were neglected. In 1350, in England, certain roads were given to private companies, to repair and collect tolls. In the eighteenth century, in the United States, turnpikes were maintained by private companies, and this custom still remains in some places, tho with poor results. In 1796 an act of Congress authorized a road from Baltimore westward, which was completed for 650 miles. Roads, however, in the U. S. created by local authorities with little or no scientific engineering have been for the most part poor. In 1889 New Jersey commenced the policy of state commission of and grants for good roads, and was soon followed by Massachusetts and other states, with the result that large improvement has been made. A National Good Roads Association was formed in 1900 (*secretary,* Arthur E. Jackson, Damariscotta, Me.), and much interest in the subject developed.

Where the roads are cared for by the farmers their time and money are often wasted. Civil engineering, at first expensive, is in the long run cheaper, and the results far better. The cost of macadamized roads varies from \$3,000 to \$9,000 per mile.

In Europe generally roads are far better than in the U. S., and built and kept under strict government supervision.

ROBERTS, GEORGE HENRY: Member British Parliament of Independent Labor Party from Norwich; born 1869 at Chedgrove, Norfolk. He was educated in the national schools and the technical institute at Norwich, whither his parents had removed in 1874. In 1883 he was apprenticed to the printing trade, and later went to London, where he came in touch with trade-unionists. On his return to Norwich he organized the Typographical Association, was its president, later secretary, and became organizer in 1894, having joined the Independent Labor Party in 1886. He has served as a member of the Norwich School Board since 1889. He was defeated in 1903 for Parliament as Labor candidate, but elected in 1906 on the same platform with a good majority. He is a hard worker, capable organizer, and a fair writer. Address: 34 Cardiff Road, Norwich, England.

ROCHDALE PIONEERS: The name given to the weavers of Rochdale (England), who started the great Rochdale cooperative movement. A rainy night in Nov., 1843, twelve men met in the back room of a mean inn and commenced this cooperative movement by organizing themselves as "The Rochdale Society of Equitable Pioneers." They agreed to pay twenty pence a week into a common fund, tho only a few of the twelve were able to pay their pence that evening.

They began by buying a little tea and sugar at wholesale prices, which they sold to their members at little more than cost. In a year their number had grown to twenty-eight, and they had collected £38, with which they rented a little store, and stocked it with £15 worth of flour. For their after history, and the success of the cooperative movement which has grown out of this beginning, see COOPERATION.

RODBERTUS, KARL JOHANN (Rodbertus-Jagetzow he is sometimes called): Socialist economist; born 1805 at Greifswald; educated at Berlin, Göttingen, and Heidelberg. After practising law, and traveling, he bought, in 1836, the estate of Jagetzow in Pomerania. Here he devoted himself to economic and other studies, and became prominent in Prussian politics. In June, 1848, he was for a fortnight Cabinet Minister for Public Worship and Education; but differences in opinion caused him to resign. He was elected in 1849, once for the First Chamber, and twice for the Second. Defeated as a candidate for the first North German Diet, he retired from politics, and Lassalle, who wrote him, could not induce him to combine his socialism with a political agitation. His first great work, published in 1842, "Zur Kenntniss unserer staatswirthschaftlichen Zustände," outlines his position. He was a Ricardian, and from this position, before Marx, deduced socialistic economics. Many modern economists call him a greater Socialist economist than Marx. He died on his estates, Dec. 8, 1875. Professor Wagner calls Rodbertus "the first, the most original, and the boldest representative of scientific socialism in Germany," and "the most distinguished theorist of the purely economic side of scientific socialism."

Rodbertus speaks of his economic theories as a "logical development of the proposition introduced into science by Smith, and established more firmly by Ricardo's school, that all commodities can only be considered economically as the product of labor, and cost nothing but labor." This proposition he places at the beginning. He argues that, however the

productivity may increase, the laborers are ever thrown back by the force of trade upon a rate of wages which does not exceed the necessary subsistence. He defines rent as that income which is derived by virtue of a possession, and without labor, and he divides rent into rent from land and rent from capital. The food and means of subsistence paid to the laborers from the produce of the land are their wages, and the rest of the commodities produced are the rent retained by the owner of the land; this is land-rent. Similarly, capital-rent is all the income which remains to the capitalist after deduction of wages paid to his laborers. But all produce is the produce of labor, and with free competition the value of every commodity gravitates toward the value of the labor expended upon it; so that the relationship between the values

Economic Analysis

of the raw and manufactured products is, on the whole, only regulated by the amount of labor expended upon each. Rodbertus points out that a change in the sum of a nation's productive force—in other words, a change in the number of laborers (apart, of course, from an alteration in productivity, or in the division of the produce)—only changes the sum of the national produce and the amounts (not the proportions) which fall to rent and wages. According as the sum of the productive forces employed increases or decreases, will more or less rent be received by the landowners, and more or less profit by the capitalists. Wages will not be higher with increased production, because, productivity and division being supposed the same, the increased produce falling to the laborers will be shared by the larger population. There can be no rent, then, first, unless the labor produce more than is necessary in order that the laborer may continue his labor; and second, unless institutions exist for depriving the laborer of this surplus, wholly or in part, and giving it to others, who do not themselves work, since the laborer is primarily in possession of the produce of his labor. This is especially seen in the case of slave-labor, where the laborer is allowed just as much of the produce as is necessary to the continuation of his labor. In modern times the arbitrary measures of the slave owner have been replaced by the wage system or contract; but, says Rodbertus, "this contract is only formally and not actually free, and hunger fully takes the place of the whip. What used to be called food is now called wages. . . . A very large part of the people is no longer able to live upon its own means, but is in some way or other thrown on the support of the other part of society. . . . This fact runs parallel with another equally indubitable, and making the first still more striking: the national wealth has simultaneously increased. Not only has the national income become greater, because the population has increased, and the increased population has therefore produced more; but if the increased national wealth be divided between the increased population there is a larger sum per head. These remarkable facts go together: (1) the impoverishment in a nation increases out of proportion to the growth of population, while simultaneously (2) the national income increases at greater ratio than the population, and the national wealth also tends to grow.

The Present

This phenomenon Rodbertus holds to be unique in history. The social condition of the working classes should be raised to the level of their political condition; but all that has been done so far has been to press it lower down. Rodbertus has no patience with the egotism which, "clothing itself too often in the garb of morality," says that the vices of the working classes are the causes of their misery and of pauperism. People call out to the laborer, *Ora et labora*, and enjoin upon him the duty of temperance and providence; but the fact is, says Rodbertus, that thrift is an impossibility, and to preach thrift where there is no chance of saving is pure cant and cruelty. Not, indeed, that morality is not to be enjoined on the working classes. Morality should never cease to enforce its categorical imperative everywhere, powerless as the human will is to attain to perfection; but the policy of merely reiterating the duty of morality is useless. He who gives bread to the hungry man, he remarks, protects him far more surely from stealing than he who repeats the command, "Thou shalt not steal." Nor has he much more respect for the *laissez-faire* school of economists. He sneers at the argument of "natural laws." Only in nature do natural laws act of themselves intelligently. For society, which is not natural, laws must be made.

Rodbertus proposes to abolish the present wage-contract and to introduce in its place a normal workday with a normal form of wages; then to introduce labor-note money, the issue of which should be entirely in the hands of the State; and finally to establish a system of warehouses for commodities to be paid as wages. These contrivances would provisionally leave property in land and capital as at present, except that for the future

Socialist Views

the laboring classes would share in the increasing productivity; but the ultimate goal is the replacement of this form of property by a property of income alone, which would inaugurate a new and a higher State order than any that has gone before. But Rodbertus's workday does not mean with him what it means with most Socialists—a legally determined number of hours' work daily. He expressly says in one place that the expectation that such a normal workday will protect the

laborers from the greed of their employers, and secure them fair wages, is entirely without foundation. Nor does he regard the legal limitation of the period of labor in the case of adult males as tenable on practical grounds, or defensible when regarded from the standpoint of personal right, though he makes an exception with females and children. "As much as I am for the subordination of the individual to the State," he says, "I still maintain that the State has no right to say to a free man, 'You shall work no more than so and so many hours.' The proper thing is to increase wages, and then, if the workman finds that he can earn in four hours enough to keep him for the day, there will be little fear of his working twelve. Even if the State were to restrict the hours of labor to eight, and to decree that wages should not be reduced, the material position of the working classes would not be improved. Legislation which only restricts the hours of labor merely lops the branches of a poison tree. Legislation which at once fixes a definite amount of labor, or rather a definite performance (*Leistungsquantum*), lays the ax at its roots, plants in its place a healthy, fruitful tree, which it can then allow to shoot and blossom as freely as it will." "The way is long," he remarks in one of his letters, but for that reason it is desirable that the journey shall be begun without delay. Justice and prudence alike urge the necessity for movement, since the social question is fast taking this form: "Are the proprietors of the soil to be driven out, as in a migration of the nations, by those who are without property?" But the cost! "Certainly, the solution of the social problem will cost more than the printer's ink of a police order, simply because it is the social problem." He is confident that this problem will never be settled "in the street by means of strikes, paving-stones, or petroleum"; that social ills will not be "relieved, much less healed, by camomile tea." Permanent social peace, a strong executive power, enjoying the confidence and attachment of the working classes, and extensive preparations made in quiet and order, are all necessary preliminaries to the final settlement of a difficulty which becomes more dangerous the longer it is ignored.

Rodbertus's most important works, besides the above named, are "Soziale Briefe an v. Kirchmann" (1850-51); "Zur Erklärung und Abhülfe der heutigen Kreditnoth des Grundbesitzes" (1868-69); "Der normale Arbeitstag" (1871).

The best English account of Rodbertus is to be found in W. H. Dawson's "Socialism and Ferdinand Lassalle," from which our account is abridged.

ROGERS, JAMES EDWIN THOROLD: Historian, economist; born in Hampshire, England, 1823. He matriculated at Magdalen Hall, Oxford, in 1842; was graduated in 1846. He took holy orders, but later renounced them; In 1862 he was elected professor of political economy at Oxford, but failed of reelection in 1868, owing to his radical views. From 1880 to 1886 he sat in Parliament, and was reinstated professor at Oxford in 1888, where he died in 1890. Commencing an economist of the orthodox economic school, he devoted himself to economic historical research, and investigation soon convinced him that orthodoxy in this case was very radically wrong; this conviction grew still more upon him, and was stated with still greater force, as years went on.

With the conclusions that he drew from his labors in social and industrial history, later economists have felt themselves often compelled to disagree, but his learning and capacity for research none can question.

Twenty years of patient investigation he put into his "History of Agriculture and Prices." He collected thousands and thousands of records of prices actually paid for different commodities, or for various kinds of labor; put together the records of the different kinds belonging to the same year; averaged these, then averaged these averages for decades, and these decade averages for period averages; and has thus obtained results it is impossible to question, because based on statements written with no thought of the use to which they would be put.

Professor Rogers found these records in old

exchequer bills, college records, manor rolls, farm accounts, preserved, as it were, by accident, in the State, university, and municipal archives of English libraries. It was almost by accident that Professor Rogers discovered them and saw their unique value.

Author: "Six Centuries of Work and Wages"; "History of Agriculture and Prices," 6 vols.; "The Economic Interpretation of History"; "The Industrial and Commercial History of England."

ROMAN CATHOLIC CHURCH AND SOCIAL REFORM, THE: In this exposition social reform is understood as including specific activity directed toward the relations of labor and capital in the industrial process: the function of the State; the social constitution of the laboring class; the theory of property; the rights of the individual and of the family as invaded by actual economic conditions. Attention is not directed to the administration of charity, to measures or methods of temporary relief, or to the historical rôle of the Church in caring for the poor. As the reform activity of Catholics is adjusted to national, political and social conditions, one finds various degrees of intensity of effort and more or less divergent policies in different countries. In the United States and England the Catholic movement is not developed; in Italy it is governed by extraordinary local conditions. On the Continent it has reached splendid proportions. To this last attention is mainly directed.

The Church conceives her mission to be primarily spiritual and supernatural. She holds that she is divinely commissioned as teacher and sanctifier, that her constitution is divine, and that she alone is its qualified interpreter. She sees all life, truth, action in their organic unity, drawing inspiration and law for present life from the life to come. She sees spiritual in relation to material, temporal in relation to eternal, social in relation to individual. Hence the Church's judgment of social processes, institutions, problems, and reform is part of a comprehensive spiritual view of life.

Within the content of the Church's normal teaching are views on human rights and personal-ity, justice, property, family; on

Basis

social relations, the constitution of society, the sanction and function of authority, of law, of virtue, derived from revelation and from her understanding of the natural law. Social questions present themselves to the Church's mind primarily in the form of error or sin, to be met and conquered by truth and virtue. Hence her first impulse to social reform directs her, not so much to social institutions as to correction of minds by true teaching and reforming hearts by instilling virtue. When, however, erroneous teaching disturbs human relations and is incorporated into the customs, constitutions, and laws of a time; when injustice and oppression are due to these erroneous views, the Church will enter directly the field of reform to protect "morality, justice, human dignity, and the family." As modern society presents just such a condition of comprehensive error and widespread injustice, the social reform movement in the Church is aggressive, powerful, with a developed program of reform, an able and dignified press, and with a high type of leadership.

In all such effort the Church is conservative. A strong historical sense leads her to recognize the slow working of social laws; she is inclined to

recognize an established order as sanctioned, since all ethical relations are expressed in its terms, and she fears the disorder of unstable institutions; she believes in the reform value of truth and virtue, hence she is slow to advance against institutions as such. The thoughtful observer who is impressed by seeming paradoxes in the Church's social activity may find explanation of them by considerations such as these.

The founder and teacher of the Catholic social reform movement was Bishop von Kettler of Mayence (1811-77). A contemporary of

History

Lassalle (*q. v.*), he witnessed the political and industrial awakening of German democracy. He brought talent, energy, sympathy, and rare courage to the work, and by the year 1864 he had formulated a definite social program. He found the cause of suffering, degradation, and oppression in the supremacy of capital which was due to liberalism; he found that wages were regulated by supply and demand, with a tendency to fall to the level of subsistence. He rejected Lassalle's plans of reform, though sympathetic with much in his activity; he rejected likewise all proposals of the liberal party, and offered a definite plan of reform instead. He placed his main hope in Christianity's spirit of love, self-denial, and self-control. He advocated homes for disabled laborers, the restoration of the family through Christian teaching, higher wages based on the value of labor, shorter workday, protection of Sunday rest, exclusion of children, married women, and girls from factories, and the formation of productive associations.

The character of Bishop von Kettler, the definiteness of his teaching, and its break with accepted political philosophy, attracted wide attention and roused Continental Catholics to action. Germany and Austria accepted the program and organized. The *Kulturkampf* gave German Catholics a party, the *Centrum*, through which they had opportunity to give legislative expression of their thought. Laity, clergy, episcopate were quickly organized; Catholics became a political power; literature, organizations, methods developed and the social reform platform became one of the striking features of the Church's activity. In Austria Prince von Lichtenstein and Baron von Vogelsang, in Switzerland Cardinal Mermillod and Mr. Decurtins, appeared early as leaders, and national Catholic movements arose in close sympathy with Bishop von Kettler's in Germany. In France the new movement was engrafted on the already existing circles of Catholic laborers in 1870, and Count de Mun soon exerted great influence on them. De la Memnais and Le Play had remotely influenced the awakening in France, but it took its newer form under the able leadership of De Mun. Italy and Belgium also awakened, the latter somewhat slowly, but by the eighties Catholic Europe was organized, active, conscious. Principles had been formulated, policies were adopted, methods were developed. Institutions, temperament of peoples, political conditions affected the growth of the movement variously in the nations. Some differences appeared among leaders, though the parties in the different countries exercised great influence in favor of advanced social reform legislation. The movement, sprung as it was from bishops, priests, and laymen, reached its doctrinal culmination in the encyclical of Leo XIII. on the condition of laborers in 1891. In this great action Pope Leo formally sanctioned the main principles

of the movement, threw the weight of his authority into it, and marked a new epoch in its history. With great generosity, he called Bishop von Kettler his predecessor in the work. Since the encyclical, the whole Catholic movement is based on it, as in fact the encyclical itself was based on the movement before.

Remotely the social question is due to desertion of Christianity; immediately it is due to false absolute theories of State, individual, property, liberty. Individualism has disintegrated the natural ethical constitution of society. Error in politics, in economics, in ethics, misleads the nations, exposes the weak to exploitation by the strong. Correct understanding of the ethical constitution of society, in which human rights and obligations are coordinated in harmony with moral law, must be the basis of any successful reform.

a. *The Individual*.—The individual is a person with dignity and rights antecedent to institutions.

He has a natural right to decent livelihood. An income sufficient to protect that right should be assured in social organization. The movement,

Doctrine

therefore, favors a legal guaranty of a minimum wage and increase beyond that by forms of profit-sharing, joint ownership, participation by organized labor in administration of the factory. Protection of health, of morals, of Sunday rest by law is earnestly advocated in the name of individual rights.

b. *The Family*.—The family is divinely constituted, its form, authority, and sanction being of revelation. While the zone of its action is more or less elastic, from the days of von Kettler to the present, the reconstruction and protection of the Christian family has been one of the chief concerns of the Catholic movement. Work of married women, of girls and children has been uniformly opposed and the majority of writers have drifted to the position that the average adult male wage-earner has a natural right to a family wage. The demand for shorter work-day and Sunday rest is made in the interest of family life as well as in the name of the individual.

c. *The Laboring Class*.—The laborers constitute a distinct social class on an economic basis. The movement has aimed uniformly to recognize and organize the class and give it definite political, social, and industrial functions. Influenced by the history of the old guilds, the Catholic leaders have hoped and still hope to see the laboring class organized and uplifted, allowing in their plans for the changes caused by machinery in modern industry and for differences of religion, in which features modern industry and life are unlike the Middle Ages. This ideal of reform accepts the solidarity of the laboring class, abandons individualism, proposes sweeping changes in constitution of government and in administration of industry, since the economic classes, organized, become political and social units. An outline of the plan is given in a document quoted below.

d. *State Intervention*.—In earlier days differences appeared among the leaders regarding State intervention, Germans being less opposed to it than French. But the encyclical of Leo XIII. formally committed the church to the principle of limited intervention, since which time only differences of detail appear. In the main, legislation is favored to secure minimum wage, to restrict work of women and children, to protect the Sunday, and to organize all forms of

working men's insurance. From early days in the history of the movement international labor legislation was favored. Possibly the Catholics have been the most persistent in organizing the international conferences which have been held to promote it.

c. Private Property.—Private property as an institution is uniformly defended. While the excesses of capitalism are denounced with significant emphasis, at no time does one find any wavering in the persistent defense by the movement of property and of methods to extend and protect private ownership. The duties of property are insisted on as strongly as the rights and various methods are advocated to curb speculation, hinder monopoly, and modify systems of credit. The mind of the movement sees and advocates moralized property, property fully conscious of its moral relations, moral mission and sanction. The liberal theory of property caused the social question: the Christian theory alone can settle it.

SPirit of the Movement.—One finds a strong spiritual element in the atmosphere of the movement. No reform will succeed except it be Christian at heart. Every practical measure proposed is in a direct way related to virtue, duty, faith, and charity for its effectiveness. Throughout the movement sin is recognized as the final social question. Patient acceptance of the limitations of life and of inequalities of fortune is advocated, tho brave effort is encouraged to reduce these to the smallest possible limits. The movement is skeptical of liberty, if not convinced of its failure. It hopes for and works for union of class and class in the bond of Christian charity, discourages the preaching of class antagonism, and centers hope of progress on the reconstruction of religion, property, and the family.

Differences of Opinion.—Many differences of policy and method as well as unlike understandings of principles have appeared. The Germans have been more inclined to State intervention than the French, the latter, influenced by Le Play, favoring non-legal social action. The encyclical of Leo XIII. officially sanctions intervention. Since its appearance the family wage is generally favored, tho on different grounds, some basing it on charity, some on justice. A doctorati dissertation recently accepted at the Catholic University in Washington advocated the family wage as due the average adult male wage-earner in justice. Differences have existed concerning the organization of the laboring class. Optional or obligatory incorporation, exclusion or inclusion of employers, political representation of labor corporations, self-help by the laboring class or action and assistance from upper classes, are points concerning which different views are held.

a. The Catholic parties in Europe are represented in the legislative bodies and they stand aggressively for the Catholic reform principles.

They have worked earnestly for progressive reform legislation and have made an honorable record in it.

b. A picturesque and powerful manifestation of the social Catholic consciousness is found in the many pilgrimages of French laborers to the Vatican. The first was held in 1887. They have occurred frequently since, as many as 15,000 making the journey in one year. The pilgrimages were occasions of addresses and appeals to the pope and of declarations by him. It is scarcely to be doubted that they had an influence in shaping the thought of the encyclical in the

Holy Father's mind. c. Congresses of Christian Catholic laborers, notably in France; meetings of Catholic editors interested in reform, from all of which have emanated declarations of principle and policy which serve well to clear the consciousness of the Catholics on reform matters. d. Creation of mutual benefit associations, insurance and cooperative purchasing societies. e. Practical efforts to reconstruct the family of the laborer on a small property-holding basis by facilitating ownership of homes, cultivation of small gardens, and securing exemption laws. f. Encouragement of incorporation of bodies of laborers with a view to the acquisition and holding of property for common advantage. g. Organization of the Third Order of St. Francis to teach social truths and to combat injustice.

RELATIONS.—Although the name socialism is frequently applied to this Catholic movement, there is, strictly speaking, no socialism in it. In theology, ethics, philosophy; in spirit, method, aim, organized socialism is the antithesis of the Catholic movement. The Church has formally condemned organized socialism and organized socialists have strongly condemned the Church. That both should feel a common impulse to uplift man does not justify one in attempting to identify them. Nor is the name Christian socialism properly to be applied to the Catholic movement. The aim, method, and theology of Christian socialism as developed in England are quite unlike those of the movement fostered in Catholic Europe. There is much sympathy with the claims and institutions of organized labor; in many points the two movements are identical. The Church is more given to personal idealism than to institutional idealism. This trait seems to govern her relations with reform movements, and it marks her place as unique among the reform forces of the time.

LITERATURE.—The literature created by the Catholic reform movement in Europe is enormous, and much of it shows a very high order of ability and insight. First in the order of authority come the encyclicals of Leo XIII. and the *Motu Proprio* of Pius X. printed herewith, since it contains the latest official summary of principles to guide the Catholic movement. Numberless weekly and monthly publications are issued; many treatises on the fundamental principles of property, justice; on the family, the State, on the social question, social ethics, are to be found. Reports of congresses, declarations of principles, addresses by leaders exist in abundance. Every phase of the whole situation is thus lighted up and the movement is equipped admirably.

The Catholic reform movement has not reached great proportions in the United States or England, owing to the circumstances of national and religious life. Cardinal Manning in England did much to throw the weight of Catholic sanction toward organized labor, minimum wage, and reform activity in general. In the U. S. Cardinal Gibbons, by defense of the Knights of Labor against suspicion in Rome, paved the way for a literature and sympathy with organized labor, which have developed to fair proportions. One meets declarations of principles on social reform in meetings of many Catholic societies, and of the American Federation of Catholic Societies. In Catholic congresses, such as those held in Baltimore in 1889 and in Chicago in 1903,

resolutions are adopted but they rarely lead to definite action. Whatever the theoretical, literary, or local features of reform be in the U. S., the movement is not a national power nor even a vital element in the national life of the Catholic Church in this country. There is no whole plan of social reconstruction advocated as is the case in Europe. Expressions of view are usually confined to definite repudiation of socialism and general appeals to the sense of Christian duty.

DOCUMENTS.—The authoritative principles which are formally stated for the guidance of the Catholic reform movement are found in the *Motu Proprio* of Pius X. issued Dec. 18, 1903. Omitting a few paragraphs which have reference to Italy, it is printed herewith, the translation being taken from *The Dolphin*, Feb., 1904:

Our illustrious predecessor, Leo XIII., of holy memory, traced out luminously the rules that must be followed in the Christian movement among the people in the great encyclicals *Quod Apostolici Muneris* of Dec. 28, 1878; *Rerum Novarum* of May 15, 1891; and *Graves de Communi* of Jan. 18, 1901; and further in a particular instruction emanating from the Sacred Congregation for Extraordinary Ecclesiastical Affairs of Jan. 27, 1902.

And we, realizing, as did our predecessor, the great need that the Christian movement among the people be rightly governed and conducted, desire to have those most prudent rules exactly and completely fulfilled, and to provide that nobody may dare depart from them in the smallest particulars. Hence, to keep them more vividly present before people's minds, we have deemed it well to summarize them in the following articles, which will constitute the fundamental plan of Catholic popular movement.

I. Human society, as established by God, is composed of unequal elements, just as the different parts of the human body are unequal; to make them all equal is impossible, and would mean the destruction of human society. (Encyclical, *Quod Apostolici Muneris*.)

Fundamental Regulations II. The equality existing among the various social members consists only in this: that all men have their origin in God the Creator, have been redeemed by Jesus Christ, and are to be judged and rewarded or punished by God exactly according to their merits or demerits. (Encyclical, *Quod Apostolici Muneris*.)

III. Hence it follows that there are, according to the ordinance of God, in human society princes and subjects, masters and proletarians, rich and poor, learned and ignorant, nobles and plebeians, all of whom, united in the bonds of love, are to help one another to attain their last end in heaven, and their material and moral welfare here on earth. (Encyclical, *Quod Apostolici Muneris*.)

IV. Of the goods of the earth man has not merely the use like the brute creation, but he has also the right of permanent proprietorship—and not merely of those things which are consumed by use, but also of those things which are not consumed by use. (Encyclical, *Rerum Novarum*.)

V. The right of private property, the fruit of labor or industry, or of concession or donation by others, is an incontrovertible natural right; and everybody can dispose reasonably of such property as he thinks fit. (Encyclical, *Rerum Novarum*.)

VI. To heal the breach between rich and poor, it is necessary to distinguish between justice and charity. There can be no claim for redress except when justice is violated. (Encyclical, *Rerum Novarum*.)

OBLIGATIONS OF JUSTICE

VII. The following are obligations of justice binding on the proletariat and the workingman: To perform fully and faithfully the work which has been freely and, according to equity, agreed upon; not to injure the property or outrage the person of masters; even in the defense of their own rights to abstain from acts of violence, and never to make mutiny of their defense. (Encyclical, *Rerum Novarum*.)

VIII. The following are obligations of justice binding on capitalists: To pay just wages to their working men; not to injure their just savings by violence or fraud, or by overt or covert usuries; not to expose them to corrupting seductions and danger of scandal; not to alienate them from the spirit of family life and from love of economy; not to impose on them labor beyond their strength, or unsuitable for their age or sex. (Encyclical, *Rerum Novarum*.)

IX. It is an obligation for the rich and those who own property to succor the poor and the indigent, according to the precepts of the Gospel. This obligation is so grave that on the day of judgment special account will be demanded of its fulfillment, as Christ Himself has said (Matthew 25). (Encyclical, *Rerum Novarum*.)

X. The poor should not be ashamed of their poverty, nor

disdain the charity of the rich, for they should have especially in view Jesus the Redeemer, who, tho He might have been born in riches, made Himself poor in order that He might enable poverty and enrich it with merits beyond price for heaven. (Encyclical, *Rerum Novarum*.)

XI. For the settlement of the social question much can be done by the capitalists and workers themselves, by means of institutions designed to provide timely aid for the needy and to bring together and unite mutually the two classes. Among these institutions are mutual aid societies, various kinds of private insurance societies, orphanages for the young, and, above all, associations among the different trades and professions. (Encyclical, *Rerum Novarum*.)

XII. This end is especially aimed at by the movement of Christian popular action of Christian Democracy in its many and varied branches. But Christian Democracy must be taken in the sense already authoritatively defined. Totally different from the movement known as Social Democracy, it has for its basis the principles of Catholic faith and morals—especially of not injuring in any way the inviolable right of private property. (Encyclical, *Graves de Communi*.)

XIII. Moreover, Christian Democracy must have nothing to do with politics, and never be able to serve political ends or parties; this is not its field; but it must be a beneficent movement for the people, and founded on the law of nature and the precepts of the Gospel. (Encyclical, *Graves de Communi*. Instructions of the S. Cong. for Extraordinary Ecclesiastical Affairs.) Christian Democrats in Italy must abstain from participating in any political action—this is under present circumstances forbidden to every Catholic for reasons of the highest order. (Instructions as cited.)

XIV. In performing its functions, Christian Democracy is bound most strictly to depend upon ecclesiastical authority, and to offer full submission and obedience to the bishops and those who represent them. There is no meritorious zeal or sincere piety in enterprises, however beautiful and good in themselves, when they are not approved by the pastor. (Encyclical, *Graves de Communi*.)

XV. In order that the Christian Democratic movement in Italy may be united in its efforts, it must be under the direction of the Association of Catholic Congresses and Committees which during many years of fruitful labor has deserved so well of Holy Church, and to which Pius IX. and Leo XIII., of holy memory, entrusted the charge of directing the whole Catholic movement, always, of course, under the auspices and guidance of the bishops. (Encyclical, *Graves de Communi*.)

Catholic Writers XVI. Catholic writers must, in all that touches religious interests and the action of the Church in society, subject themselves entirely in intellect and will, like the rest of the faithful, to their bishops and to the Roman Pontiff. They must, above all, take care not to anticipate the judgments of the Holy See in this important matter. (Instruction as cited.)

XVII. Christian Democratic writers must, like all other Catholic writers, submit to the previous examination of the Ordinary all writings which concern religion, Christian morals, and natural ethics, by virtue of the Constitution *Officiorum et Munerum* (Art. 41). By the same constitution ecclesiastics must obtain the previous consent of the Ordinary for publication of writings of a merely technical character. (Instruction.)

XVIII. They must, moreover, make every effort and every sacrifice to insure that charity and harmony may reign among them. When causes of disagreement arise, they should, instead of printing anything on the matter in the papers, refer it to the ecclesiastical authority, which will then act with justice. And when taken to task by the ecclesiastical authority, let them obey promptly without evasion or public complaints—the right to appeal to a higher authority being understood when the case requires it; and it should be made in the right way. (Instruction.)

XIX. Finally, let Catholic writers take care, when defending the cause of the proletariat and the poor, not to use language calculated to inspire aversion among the people of the upper classes of society. Let them refrain from speaking of redress and justice when the matter comes within the domain of charity only, as has been explained above. Let them remember that Jesus Christ endeavored to unite all men in the bond of mutual love, which is the perfection of justice and which carries with it the obligation of working for the welfare of one another. (Instruction.)

The foregoing fundamental rules of our own initiative and with certain knowledge do renew by our apostolic authority in all their parts, and we ordain that they be transmitted to all Catholic committees, societies, and unions of every kind. All these societies are to keep them exposed in their rooms and to have them read frequently at their meetings. We ordain, moreover, that Catholic papers publish them in their entirety and make declaration of their observance of them—and, in fact, observe them religiously; failing to do this they are to be gravely admonished, and if they do not then amend, let them be interdicted by ecclesiastical authority.

But as words and energetic action are of no avail unless preceded, accompanied, and followed constantly by example, the necessary characteristic which should shine forth in all

the members of every Catholic association is that of openly manifesting their faith by the holiness of their lives, by the spotlessness of their morals, and by the scrupulous observance of the laws of God and of the Church. And this because it is the duty of every Christian, and also in order that he who stands against us may blush, having nothing evil to say of us. (Tit. 2:8.) From this solicitude of ours for the common good of Catholic action, especially in Italy, we hope, through the blessing of God, to reap abundant and happy fruits.

The following declaration, made a few years since in Germany, is indorsed by the best known and ablest Catholic students and writers on social reform. It states the ultimate ideal as well as the actual reforms favored. It may be taken as fairly representative:

The anti-Christian ideas of liberalism on the unlimited liberty of man and the unrestricted right of property have caused serious disturbance in the actual social and economic order. These principles worked into legislation have resulted in the domination of the economically stronger and in the misunderstanding of the dignity and rights of labor which they have abandoned to the caprice of capital. They have almost entirely destroyed the stability of the middle class; they have caused an accumulation of wealth in the hands of a small number and the impoverishment of the great majority, making almost impossible the material well-being of the laboring classes.

Catholic sociologists regard that situation as unhealthy, untenable, threatening society with ruin, and they hold that it urgently demands a remedy.

They reject the ideas and principles of liberalism which have caused the situation. They reject as well the tendencies of socialism, which would take away private ownership of the means of production and transfer it to society, because they are in contradiction with the natural right of man to acquire property for himself, because they dishonor man and make impossible the peace and prosperity of society. They believe that the social evils of the present day can be remedied only by the application of the principles of Christianity to economic life, as exposed in the encyclicals of the sovereign pontiff on the Christian constitution of states and the condition of the laboring class. They hold it to be one of the most important missions of well-regulated civil society to protect the material interests of all in a way to favor the inherent desire of human nature for liberty and independence. To accomplish that purpose they recommend a more equitable distribution of profits and of private property for the advantage of a middle class comprising the largest possible number of citizens. As one of the most efficacious means for the reconstruction and preservation of an independent middle class, they propose the organization of professional interests into different states (*Etats*) for the protection and development of common and of particular interests.

All Catholic sociologists set up as the end of their social reform efforts a professional organization of society on the basis of Christian principle, adapted to actual economic and social conditions, with rights guaranteed by the constitution to the states; autonomy of administration and representation of their interests in the legislative body.

To facilitate the gradual accomplishment of this desideratum, the undersigned demand that the State protect and favor all efforts based on principles of justice and Christian charity—to organize into corporations the agricultural, industrial, commercial, and liberal professions.

The document then summarizes the actual demands made to meet present abuses. In the interests of *agriculture*, demand is made for corporate organizations of farmers, thorough regulation of credit, inheritance, landholdings, speculation. For protection of *industry*, the signers favor obligatory incorporation of trades, legal regulation of proof of skill, of apprentices, legal demarcation of trades. As regards greater industrial enterprises, demand is made for guaranty of capacity and character of those in charge, of sanitary conditions, and of rights of surrounding population. Laws for general protection of laborers, to secure just wages, stable occupation, reduction of hours of labor, suppression of work of married women, and restriction of work of girls and children; regulation and inspection of domestic labor when done for commerce; guaranty of the right of laborers to organize; creation of organizations including employers and employed. In the in-

terests of *commerce*, the document favors measures to guarantee the moral character and ability of those engaging in business; suppression of unfair competitive methods; rigid control of speculation. Among measures of a general character favored are these: efficient protection of the Sunday; suppression of vagrancy and of usury; income tax; municipal employment bureaus; creation of associations to build working men's homes. The document concludes: "May the world be convinced of the urgent need of organization of society on a professional Christian basis. May the State take in hand at once the accomplishment of effective reform to obviate an imminent catastrophe, to promote the welfare of the laboring class, for the glory and blessing of the country."

The Count de Mun, best known of French Catholic leaders, summarizes the Catholic position as follows:

The ensemble of our demands should tend to assure to the people the enjoyment of essential rights misunderstood by individualism; legal representation of their interests and necessities in place of pure numerical representation; the preservation of the home and family life; a wage which will support the worker's family; protection against insecurity due to accident, illness, unemployment, and old age; insurance against inevitable helplessness; profit-sharing and joint ownership of capital; protection against speculation and stock-jobbing. . . . Two agencies should unite to realize this program: professional organization and legislation.

These reforms would be vain, inefficient, or impossible if they were not founded on Christian education, which is the basis of morality; on the teaching of the catechism, which leads one to know and respect the rights of God; single guaranty of the rights of man; on the doctrine of the Gospel which teaches the practise of reciprocal duties as well as respect for natural rights, which commands men to love one another and makes of charity a duty as well as justice, which shows to the poor as to the rich, above and beyond the legitimate pursuit of material things, their immortal destiny as the supreme end of life, and shows them voluntary sacrifice as the means to attain it; if they are not founded, last of all, on the liberty of the Church, a condition essential to its apostolate, to its work of enlightenment and mercy, to its entire moral and material influence.

ROME: Rome, in political science, may be said in a large degree to stand in philosophical antithesis to Athens. As in Greek political thought, the individual is conceived as springing from the State, in Rome, to a large extent, so far as its foundation was philosophically analyzed at all, the State is considered to spring from the individual. Philosophically Rome was individualistic where Athens was socialistic. Undoubtedly this distinction must not be pressed too far; neither city consistently developed its basic thought into either socialism or individualism. Rome especially was practical and utilitarian rather than theoretic. Nevertheless, it is to Rome rather than to Greece that we go to find the beginnings of the modern individualistic theory of natural rights developed by Locke, Hobbes, Rousseau, Jefferson, and all individualists which conceives of the State as a compact or creation in some form of individual wills, so that we say that governments only derive their just powers from the consent of the governed. It was Rome that first developed the distinction between the *jus gentium* and the *jus civile*. (See NATURAL RIGHTS.) It is to the Roman juriconsults that we mainly

go for the foundation principles of modern jurisprudence.

It works out continually in Roman history. Roman history may be said to be one long struggle of individuals or groups of individuals contesting for their rights. Families, tribes, gentes, plebeians, patricians, each struggle for their own. Having thrown off their kings, out of this individualistic political competition, the strongest survive. A steadily lessening number of individuals wield the power as their rivals go down in the struggle. Thus we have the plebiscite, the comitia centuriata, tribunes, quaestors, decemvirs, censors, curules, consuls, triumvirs—finally Caesar, the one man—a tumultuous stream, with many windings but one general course. Out of the individualistic basis, the struggle for rights, came at last the strong man and the death of freedom, even as in Athens, while she held to her State basis, came the greatest amount of individuality the world has ever known. (See ATHENS.)

Yet even the Caesar ruled and issued edicts and built his monuments in the name of the Senate and people of Rome (S. P. a R.). The forms of individualistic freedom were preserved long after the actuality had departed. "The various offices of the republic were not annihilated but gradually concentrated in a single man" (Lecky, "History of European Worlds," vol. i, chap. ii.).

Yet Rome very slightly developed her politics in conscious thought. She adopted Greek ideas and gave them a twist and a development they had never known. Her genius was practical constructive military rather than philosophic. Polybius in his analysis of the Roman Constitution and Cicero in his presentations of Greek thought are almost the only Roman writers on political science. In political economy they did even less.

In spite of their practical views of life and utilitarianism, they produced no highly developed system of manufacture or exchange. The agricultural habits of the first Romans soon

Economics gave place, through the increase of militarism, to an extensive system of slave-labor. Large estates took the place of small holdings, and drove the peasant proprietor to the city streets. Commerce and industry were regarded by the free citizen with contempt, and even the noblest Romans were not free from this disdain of manual labor.

Some signs of economic thought are to be found in the writings of the philosophers and jurists; but most of their ideas were taken from the Greeks, and none of their original conceptions are of much scientific value. The philosophic writers express the general feeling of industrial decay, and the increasing tendency toward luxury and immorality. To be sure the virtues and pleasures of rural life and agriculture are much dwelt upon, but chiefly with no higher purpose than to glorify the hardihood of the early Romans. As to the social evils which surrounded them they were very largely indifferent and short-sighted. Pliny, "The Elder" (23-79), who is not so much an independent thinker as an Encyclopedist, in his "Natural History" favors agriculture on the large scale, but protests against the slave-tilled *latifundia*. He expresses a preference for barter rather than for a money exchange, and deprecates the use of gold. Varro and Columella are to be credited with having perceived the superiority of free labor to that of slaves; and, together with Cato, they advocate a return to agriculture as the best means to avert the flood of corruption and immorality which was then felt to be approaching the empire. Cicero translated Xenophon's "Economics" and also praised agriculture.

As to the general principles of industrial progress they have little to say. In general, the Roman theorists agreed with the Grecians in disapproving of interest, Cato going so far as to liken it to murder. In B.C. 341 the taking of interest was entirely forbidden by the Genucian Law.

Both Greeks and Romans approached social problems from the political rather than the economic side. Political economy is necessarily a modern science.

ROOSEVELT, THEODORE: Twenty-sixth President of the United States; born in New York City, 1858. From private schools in New York he went to Harvard University and graduated in 1880. Traveling in Europe and making hunting expeditions in the West, he returned to New York and took part in the politics of his own ward. He was sent to the Assembly in 1883, 1884, and 1885, where he made a record as an independent Republican and a relentless foe of political jobbery and corruption. He procured the Roosevelt investigation and some administrative reforms. In 1886 he was unsuccessful Republican candidate for mayor against Abram S. Hewitt and Henry George. In 1889 he was appointed Civil Service Commissioner and threw himself actively into the work, which he continued till 1895, when he became president of the New York City Police Board, thinking that the "storm center" was there. By his vigorous enforcement of Sunday-closing laws he made many friends and bitter enemies. In 1897 he was appointed Assistant Secretary of the Navy, which position he resigned in 1898 to help organize the First U. S. Cavalry Volunteers (Rough Riders), which distinguished itself for gallantry in the Spanish War. The same year he was elected Governor of New York State, Jan., 1899, to Dec., 1900. In 1900 he was nominated vice-president by the Republican Party and elected. On the death of McKinley, Sept. 14, 1901, he became president, and was reelected to a second term in 1904. He has been aggressive for the reforms he believes necessary, in the controlling of the monopolies by the federal government and in giving "a square deal" to all. (For his views, see REPUBLICAN PARTY.) Besides writing upon the West and hunting trips, his main works have been "Naval War of 1812" (1881); "The Winning of the West" (4 vols., 1889-95); "History of New York" (1890); "Essays on Practical Politics" (1892); "American Ideals and Other Essays" (1897); "The Strenuous Life" (1900). *Address:* The White House, Washington. Summer residence, Oyster Bay, Long Island, N. Y.

ROSCHER, WILHELM GEORG FRIEDRICH: Philosopher; economist; born 1817, in Hanover; studied at Göttingen and Berlin. In 1838 took the degree of doctor of philosophy at Göttingen, where, in 1840, he became privat-docent for history and economics. In 1843 he was appointed extraordinary, and 1844, ordinary professor. In 1848 he was called to Leipsic, where he remained, tho repeated calls came from other universities—Munich, Vienna, and Berlin—till his death in 1894.

Dr. Roscher achieved a lasting fame as the founder of the historical school of political economy, and many learned associations have delighted to do him honor. Professor Cohn says of him:

In the foremost rank we must place a man, who shortly before had acquired a reputation by a philological-historical work, and then turned to political economy, Wilhelm Roscher. His "Vorlesungen über Staatswirtschaft nach geschichtlicher Methode" (Lectures on State Economy on Historical Method) were only the outlines of his lectures . . . but the one happy analogy by which Roscher applied the results of the historical school to political economy was a scientific achievement. The conclusions which he drew from this analogy, in regard to the mission of the historical school of political economy, are the same which the historical school of law had drawn for their science a generation previous—even his quotations from Justus Möser and Bacon are borrowed from Savigny; nevertheless, the service he rendered to our science is a great and lasting one.

Roscher's conclusions as to the mission of political economy were as follows:

(1) The study of the economy of the State is a political science, whose mission is to understand men, and control men. . . . (2) We need an investigation of the earlier stages of civilization in order to understand the nature of modern civilization; and further of (3) the economic development of different nations, with especial reference to the nations of classic antiquity, whose development lies before us in its totality. (4) Out of all this arises the practical demand which the science makes upon us, viz.: the task of constructing modern measures of economic policy on an historical basis, or, in other words, learning what is suited for the present time by studying the historical growth of individual institutions.

Author: "Grundriss zu Vorlesungen über die Staatswirtschaft nach geschichtlicher Methode"; "System der Volkswirtschaft," vol. i.; "Die Grundlagen der Nationalökonomik," vol. ii.; "Nationalökonomie des Ackerbaues und der verwandten Urproduktionszweige," vol. iii.; "Nationalökonomie des Handels und Gewerbetreibens," vol. iv.; "System der Finanzwissenschaft"; "Ansichten der Volkswirtschaft aus dem geschichtlichen Standpunkte."

ROSS, EDWARD ALSWORTH: American sociologist and publicist; born Virden, Ill., 1866. Graduate Coe College, 1886; taught at Port Dodge, Iowa, 1886-88; University of Berlin, 1888-1890. Ph.D., Johns Hopkins University, 1891; professor economics and social science, Indiana University, 1891-92; University associate, Cornell University, 1892-93; professor Stanford University, 1893-1900; studied abroad, 1898-99; professor University of Nebraska, 1901-6; professor of sociology at University of Wisconsin, 1906. Professor Ross holds neither to individualism nor to collectivism, but avows as his creed social energism of which the cardinal points are: minimization of wasteful conflict, maximization of cooperation, unleashing of human energy, diffusion of security, socialization of the higher goods of civilization, and conscious acceleration of progress. Author of "Sinking Funds"; "Honest Dollars"; "Social Control"; "The Foundations of Sociology." Address: University, Madison, Wis.

ROUSSEAU, JEAN JACQUES: Philosopher of the naturalistic school; born of French parentage, Geneva, Switzerland, 1712. His mother dying when he was very young, his dissipated father abandoned him and he was taken charge of by a relative and placed under the tutorage of a clergyman at Bossey. In his twelfth year he was apprenticed to a notary, and a year later to an engraver; in 1728 he ran away, and in Savoy came under the protection of Mme. de Warens, but soon left and went through a variety of experiences, for a short time footman to Mme. de Vercellis in Turin. Later he returned to Mme. de Warens and became her lover as well as her protégé. His tendency to wander took him away from her; returning to find her gone, he resumed his wanderings and adventures; in 1732 he went to Paris and secured a position in the service of Sardinia, but found Mme. de Warens again and was installed in her household, and when his health failed he went with her to Chambéry, passing the time with music and reading. In 1741 he returned to Paris, read a paper on the theory of music before the Academy of Sciences, but being unfavorably received he became for a year and a half secretary to M. de Montagne, French ambassador at Venice. He came back to Paris, still a wanderer, now and again led into immorality, yet making friends and earning a pre-

carious living by copying music and acting as secretary to Mme. Dapin. At this time he married a servant girl, Thérèse Levasseur. Five children were born to them; all were committed to the foundling hospital. He now gained some literary notoriety. Diderot accepted him as a contributor to his "Encyclopédie." In 1749 he won the prize offered by the Academy of Dijon for an essay on the effect of the progress of civilization, arguing the superiority of the state of nature. Its publication in 1750 made him famous.

He embraced the Catholic faith in 1754; he returned to Protestantism and went to Geneva as a free citizen; in 1756 returned to Paris and occupied the "Hermitage" for a year, during which time he wrote "La Nouvelle Héloïse." He quarreled with his friends and left, going to Montmorency. Here he wrote against the drama, attacking also Voltaire and Diderot. In 1762 he produced at Amsterdam "Le Contrat Social," for which he received 1,000 louis, and the same year "Émile," a treatise on education, for which he received 6,000 louis. He was now generally attacked, by the Conservatives for his "Le Contrat Social," by the moralists for his "Nouvelle Héloïse," by the Church for his "Émile." In 1762 he fled from a threatened arrest and escaped to Switzerland and then to Prussia, where Frederick II. seemed willing to protect him, and whence he wrote letters denouncing his enemies. Here he was attacked by the populace and he fled to Isle St. Pierre in the Lake of Burme till ordered to leave by the Swiss Government. He eventually went, invited by David Hume, to England, which he reached in 1766. Partly lionized, partly condemned in London, he went to Derbyshire, where he wrote most of his "Confessions." He quarreled with Hume and other English friends, and made to believe that he was being plotted against by the King of Prussia he fled to France in 1767, where he wandered from place to place, finishing his "Confessions," at last going to Paris and earning a living by copying music. He was welcomed and aided by the Marquis de Mirabeau and others, but quarreled with all friends and was thought by some to be at this time half insane; he died in a fit of apoplexy, July 2, 1778, leaving many smaller writings besides the above-mentioned works and a mass of correspondence.

(For a review of his social teachings, see article NATURAL RIGHTS.)

ROWNTREE, BENJAMIN SEEBOHM: Manufacturer; writer; born 1871, York, England; educated at the Friends' School, York; studied chemistry at Owen's College. Actively engaged in business, as well as in social and political work. Mr. Rowntree's sympathies are with the advanced radical section in English politics. He firmly believes that a deepening of the spiritual life of the nation is an absolutely necessary and essential condition to any permanently effective social reform. Author: "Poverty"; "A Study of Town Life"; "Betting and Gambling: a National Evil." Address: The Homestead, Clifton, York, England.

ROWLANDS, JAMES: Member British Parliament, of the Labor Party for Dartford, Kent; born 1851; had an elementary education; became a watch-case maker, and a freeman of the Goldsmiths' Company. He was the pioneer and later

the secretary of the Leasehold Enfranchisement Association; an honorary secretary of the Land Law Reform Association. He is a member of the National Liberal Club. He was returned to Parliament in 1906 chiefly by the Labor vote, assisted by the Liberals. Address: 119, Mercer's Road, Tufnell Park, N. London, England.

ROYCROFTERS: An industrial community at East Aurora, N. Y., organized in 1895 by Elbert Hubbard (q. v.). The community has a capital stock of \$300,000, fully paid in, and a membership of 500 people, 100 of whom are stockholders in the institution. The rest enjoy the various privileges that the community affords, such as admission to lectures, classes, musicals, and the use of the library and art gallery.

The Roycrofters manufacture artistic books, terra-cotta, ornamental iron-work, and furniture. The community also raises most that it needs for food. (For its profit-sharing plan, see HUBBARD, ELBERT).

RUGE, ARNOLD: Professor; revolutionist; born Bergen, island of Rügen, 1802. He studied philology and philosophy at Halle, Jena, and Heidelberg; in 1824 he was imprisoned for five years at Colberg, for membership in a secret political society; 1831 he was appointed professor of esthetics at Halle, and attracted much attention as a philosophical critic; 1843 he joined Karl Marx (q. v.) in Paris, and they published the "Deutsch-französische Jahrbücher." He was elected to the German Parliament in 1848, and the same year founded the paper *Reform* at Berlin. This was soon suppressed, and after attempts at revolutionary intrigue in Dresden and Carlsruhe he went to London in 1849 and formed a European Democratic committee with Ledru-Rollin and Mazzini in London. He died at Brighton, 1880. Besides the above-mentioned works he published "Zwei Jahre in Paris"; "Poetische Bilder" and "Politische Bilder"; "Unser System"; "Ausführlicher Zeit"; "Manifest an das deutsche Volk."

RUSH, BENJAMIN: Abolitionist; born Byberry, near Philadelphia, 1746. He studied medicine in Philadelphia, Edinburgh, London, and Paris; began practise in Philadelphia in 1769, and made professor of chemistry in the medical college there. In the provincial conference in Pennsylvania he moved the resolution to formulate its sentiments for a Declaration of Independence; chosen to the Continental Congress; became one of the signers to the Declaration of Independence. Dr. Rush was made surgeon-general of the middle department of the army, and soon after physician-general.

In 1778 he resigned his position because of wrongs done to the soldiers in regard to the hospital stores, and resumed practise in Philadelphia. About 1785 he planned there the first dispensary in the United States.

In the state convention he was a staunch supporter of the federal constitution. He was a member of the convention of Pennsylvania to form a state constitution.

While the yellow fever prevailed in 1793, Dr. Rush was estimated by Dr. Ramsay to have saved 6,000 persons in Philadelphia from death by that disease. He received many honors therefor from Europe as well as America. He was president of the Society for the Abolition of Slavery and of

many other moral and religious societies, and a frequent writer on reform themes. Treasurer of the U. S. Mint from 1799 till his death in 1813.

RUSKIN, JOHN: Born in London, 1819, the son of a wealthy wine merchant. He was educated at home and at Christ Church, Oxford. He then devoted himself to painting, under J. D. Harding and Copley Fielding. In 1843 he published the first volume of "Modern Painters," the noted defense of Turner's art. He published the second volume in 1846, and the remaining volumes in 1856 and 1860, after a residence in Italy and a careful study of Italian art. In 1849 appeared the "Seven Lamps of Architecture," and from 1851 to 1853 the three volumes of the "Stones of Venice." In 1869 he was elected Slade professor of fine arts at Oxford, and reelected in 1876 and 1883; failing health compelled him to resign in 1884, since when he lived in retirement at Brantwood, Coniston. His first writing on economic subjects was "Unto this Last," essays republished from the *Cornhill Magazine* in 1862. This, with "Munera Pulveris" (1862-63), "The Crown of Wild Olive" (1866), and the letters to working men, "Fors Clavigera" (1871-84), embody his economic teachings. He and Carlyle may be said to be the prophets of the modern English Socialist movement.

The essence of his social teaching may, perhaps, be put in one of his own phrases: "There is no wealth but life; life including all its powers of love, of joy, and of admiration."

From this teaching springs all else. Because noble life is wealth it follows, with Ruskin, that that country is richest which nourishes the greatest number of noble and happy human beings; that that man is wealthiest who, having perfected the functions of his own life to the utmost, has also the widest helpful influence, both personal and by means of his possessions, over the lives of others.

Moreover, because life is wealth, it follows that only that which contributes life has a right to return in wealth; hence interest, the return of money for the use of dead money, is wrong—only those have a right to share in the products of industry who have put into the operation some industry themselves, some outgo of their own life.

These two conceptions, the law of wealth and the law of service, run through all of Ruskin's works. He teaches that wealth is "the possession of the valuable by the valiant"; that service bids English men and women to become "Soldiers of the Plowshare as well as Soldiers of the Sword."

Ruskin taught from these principles, first, the law of "Property to whom proper"—or that land and tools belong to those who can use them; secondly, that he who can, should use his tools—use his tools to develop life, the highest life in himself and others; thirdly, that this highest life can only be by cooperation instead of by competition, the thought of what we can give rather than of what we can get, the thought of what we are rather than of what we have. This, added to Ruskin's teaching as regards art, constitutes Ruskin's social system. His theory of art and his theory of society he never divorces, because they are both part of his one theory of life. Of art he taught, first, that the life of art is in religion; secondly, that its food is in the ocular and passionate love of nature; thirdly, that its health is in the humility of its artists. Applying this to his social teaching, his outcome was that society should be a cooperation

or communism of artists, submitting themselves humbly to the law of love, and in the joy of beauty working to produce the highest and the noblest that is in them.

Ruskin calls himself a communist—in his own phrase, "the reddest of the red." Yet, in equality of property he did not believe. In creating his St. George's Guild he distinctly says that there should be "no equality upon it, but recognition of every betterness, and reprobation of every worseness." He believed in government, in the State; in the cooperation of workers in the State; in award for worth; he did not believe in interest; he did not believe in the capitalist; he was the bitterest foe of the wage system and of the *laissez-faire* political economy.

Ruskin was not, however, a Socialist in all things. Politically, he was conservative. His socialism was paternal, not fraternal. He would not seek for reform through political action. He shrank from the rough and prosaic machinery of politics. The gospel of art has rarely been married to the gospel of the ballot box. Politically, Ruskin became reactionary.

Yet Ruskin attempted the concrete, altho this not so much for the value of the concrete itself as because, in trying to carry out his ideas, he could alone be consistent. His St. George's Guild was an inevitable consequence of his teaching.

"The more I see of writing," he says, "the less I care for it; one may do more with a man by getting ten words spoken to him, face to face, than by the black-lettering of a whole life's thought."

A valuable account of the Guild may be found in Edward Cook's "Studies in Ruskin":

"It was in May, 1871," says Mr. Cook, "that the scheme was first made public. In the *For* for that month Mr. Ruskin called on any landlords to come and help him who would like better to be served by men than by iron devils, and any tenants, and any workmen, who could vow to work and live faithfully for the sake of the joy of their home. All who joined St. George's standard were to do as Mr. Ruskin undertook to do; to give the tenth of what they had and what they earned, not to emigrate with, but to stay in England with, and to make a happy England of her once more."

The Guild had an agricultural, an industrial, and an artistic character. On land bought by the Guild, to which Ruskin himself largely contributed, an attempt was made to carry on an agricultural community according to Ruskin's "Laws of Life." Mr. Cook says of this:

"The agricultural experiments of the St. George's Guild have not been a brilliant success. Perhaps they have not been given a fair chance. Perhaps the times and seasons have been unpropitious. But whatever explanations or excuses there may be, the fact remains that the St. George's farms have produced very little except a plentiful crop of disappointments. Mr. Ruskin has drawn many charming pictures of his ideal settlements; but the realities have for the most part been either grim or grotesque, or (more often) both. The Guild is, however, the owner of several acres of land in different parts of the country, and there is some reason to hope that past failures will lead to future successes."

Other industrial experiments of Mr. Ruskin have been in the way of fostering village industries. He writes: "Whatever may be the destiny of London, or Paris, or Rome in the future, I have always taught that the problem of right organization of country life was wholly independent of them."
1 Mr. Ruskin's aim was not to organize industrial villages, but to revive, in existing villages, village industry.

Foremost in work in this direction stands Mr. Albert Flemming's attempt, under Ruskin's influence, to bring back the old industry of the spinning-wheel to the homes and villages of Westmoreland. In a measure it has succeeded, as one can see by reading Mr. Flemming's own account of it, printed in "Studies in Ruskin."

Another experiment was the making of "St. George's cloth" in the Isle of Man, undertaken with Ruskin's help by Mr. Egbert Rydings. The mill was built in romantic architecture by the St. George's Guild, the motive power being water and not steam. This still exists, tho it has passed into other hands than those of the Guild.

The main concrete result of the St. George's Guild has, however, not unnaturally, been artistic, in the creation and maintenance of the unique and beautiful Ruskin Museum at Meresbrook Hall Sheffield.

Besides these industrial experiments Ruskin largely used his inheritance of some £200,000, by aiding Miss Octavia Hill (see TENEMENTS) in her model tenement experiments, in making loans without interest, and in other philanthropic ways.

REFERENCE: *The Life and Work of John Ruskin*, by W. G. Collingwood (2 vols., 1893).

RUSKIN COLLEGE (Oxford, England): A workingman's college, founded 1899, as the result of agitation by Walter Vrooman, but soon passing out of his hands. Tho started with the aid of funds of friends, it has been largely sustained by the contributions of working men themselves. Says a report of 1904:

Ninety-five thousand members of the Amalgamated Society of Engineers have raised £1,350 by means of four levies of one penny each, and with the amount of their last levy are maintaining nine of their members at the college for a year; the Amalgamated Society of Railway Servants have devoted £300 to the building fund and established three scholarships; the Northern Counties Weavers have sent sums amounting to £50, and have established two scholarships; the London Society of Compositors, the Scottish Cooperative Wholesale Society, and many working-class organizations have sent contributions; many of the students who have been in residence at Ruskin College were sent and paid for by their fellow working men, and there have even been cases in which men have undertaken to provide for the wife and children of a comrade during his absence at college.

The college is intended for working men who are desirous of taking part in public and social work, and the subjects taught bear principally upon social and industrial questions—viz., political economy, industrial history, history of social movements, citizenship, local government, sociology, and logic. The work is carried on in two ways: (1) by residence at the college, and (2) by means of a correspondence school, which enables those who cannot leave their work to learn the same subjects through the post. The fees for residence at Ruskin College are £52 per annum, including board, lodging, and tuition. The fees for membership of the correspondence school are 1s. entrance fee and 1s. per month. The movement is under the control of a council.

One distinctive feature of the life at Ruskin college is that the men themselves do most of the housework, taking their turns at scrubbing floors, washing up crockery, etc. There are no servants except a cook.

That the students are genuine working men may be seen from the following list of the occupations of the thirty-four in residence in 1904: engineers, 9; miners, 9; weavers, 4; chain maker, bricklayer, dock laborer, railway workers, 3; clerk, blacksmith, carpenter, boiler-maker, mason, cloth-looker, 1 each. Nearly all are members of trade organizations, and several hold representative positions in their societies.

At first laughed at in Oxford, the best minds in the university soon recognized Ruskin College. Men like Dr. Caird, the Master of Balliol; Dr. Goudy, the regius professor of civil law, and the late Prof. F. York Powell, became members of the council of the college, and several of the professors threw open their lectures to the young workmen.

The correspondence department of the Ruskin College is quite as remarkable in its way as the work among the resident students. By its means men and women in all parts of Great Britain and in many of the colonies are studying from week to week. Printed outlines of the month's course of study are sent to every member, and in addition to the text-book, which all study, parallel

readings are suggested for those who are able to read more widely.

Principal of Ruskin College, Dennis Hird, M.A.; vice-principal, H. B. Lees Smith, M.A.; general secretary, Bertram Wilson.

RUSKIN COOPERATIVE COLONY: In 1893 Mr. J. A. Wayland, editor of *The Coming Nation*, then published at Greensburg, Ind., with a circulation of 17,000, conceived the idea of establishing a cooperative colony to be operated as nearly upon the plans laid down in Bellamy's "Looking Backward" as the present competitive system would permit. He proposed to make *The Coming Nation* the organ and basis of the movement. If the workers, who had pushed the circulation so far, would increase it to 100,000, the profits would amount to \$23,000 a year. This he would turn over to an association to buy land and to found a cooperative village, to which he would transfer the printing plant. Each member, man or woman, was to have an equal voice, whether contributing much or little. No one would be obliged to work for the community. Every one was to be free to do as he or she willed, so long as in so doing the equal rights of others were not infringed.

This proposition met with favor. The circulation of the paper grew rapidly. Steps were taken to select a site, and by July 25, 1894, when the printing plant was moved to Tennessee City, Tenn., the subscription list had reached 60,000, and a Ruskin cooperative association was formed under the laws of Tennessee, with Mr. Wayland as president. But dissensions rose almost from the start; anarchistic and socialistic elements could not combine. Mr. Wayland was criticized for selecting the site despite the adverse report of his own agent. It certainly was not favorable. The circulation of the paper, however, grew, and the colonists had to some extent to change their ideals. A stock company was organized under a mining and manufacturing charter, the stock limited to \$500,000. The actual capital was \$17,050.40. This included 1,000 acres of land, the plant of *The Coming Nation*, and contributions from the members. Shares were sold to the members at \$500 each. Wives of charter members were given shares to put them on an equal footing with their husbands. Not adopting communism, it became necessary to fix a wage scale, that all might be able to purchase supplies, and dissension arose over this. The colony also began to purchase produce of the neighboring farmers and sell this at a profit, a proceeding much criticized by many in the community. Dissensions with Mr. Wayland were more serious. Mr. Wayland was determined to have full control of the printing plant and *The Coming Nation* or sever his connection with the body; so he made a proposition to lease the plant and paper on terms which he named, and gave the stockholders just fifteen minutes to decide. Fearing disaster to the colony should President Wayland quit the management of the paper, his proposition was accepted by a vote of 35 to 2. But the vote was a reluctant one, made under pressure and afterward regretted. Resignations followed thick and fast. Timid members withdrew, receiving in all cases the full amount paid for their stock. This practise on the part of the colony, while indicating a strong desire to avoid injustice, was undoubtedly a source of weakness, as many members withdrew who would

otherwise have remained and become peculiarly useful. But, despite withdrawals, the colony seemed to be making progress when Mr. Wayland made a demand for the ownership of a new perfecting press which had cost the association \$5,000. This was regarded as unjust, and refused.

Mr. Wayland left the colony (1895) and started *The Appeal to Reason*, at Girard, Kan., and later the colony itself removed to a better site at Cave Mills, Tenn., six miles from Tennessee City.

In less than a year the work of building the new homes had been accomplished. But the colonists were hardly established in their new quarters before fresh troubles began. New members had come in, and the old charter members began to fear that they were to lose control. So they did some scheming to retain their places. They refused to issue stock to the wives of the new members on the same conditions as it was issued to their own.

Feeling became intense and bitter. Finally, the "charters," as they were called, resigned in a body and helped to elect the most turbulent of their opponents, thinking that a short experience under the new management would result in a return to the old. But this did not happen. *The Coming Nation*, entirely controlled by the editor, had for some time been favoring the anarchistic policy. Individuals, it taught, should be free to do as they pleased, independent of the collectivity. Articles were published scathing religion and expressing contempt for the marriage bond. When a petition, signed by twenty-two members, was presented to the board of directors, now controlled by the charter members, asking that *The Coming Nation* declare itself for socialism and opposed to anarchy, it was promptly tabled. This was the beginning of a bitter and relentless conflict between the socialistic and anarchistic elements which ended in a series of injunctions, most of which failed to hold, but one of which (based on the claim that the building of houses and the running of schools, a lyceum, and a dining-hall were inconsistent with the charter of a mining and manufacturing company) resulted in throwing the colony into the hands of a receiver, and stripping it of property valued at \$100,000, tho the corporation did not owe a dollar. The disappointed colonists met and organized anew. They were able to retain their printing plant and some of their personal effects, but "their land, springs, caves, communal house, dwellings, college building, and other appurtenances, valued at over \$100,000, were sold to a company which, it is said, included court officers and attorneys who figured in the legal proceedings."

Over 250 of the colonists, however, unconquerable in spirit, determined to try again. At great expense they moved to Duke, Ga., in Ware County, and with great energy successfully started anew, calling it the Ruskin Commonwealth, and still publishing *The Coming Nation*. All the members were pledged to the principles of the community, which were socialistic, and to an obedience to the Golden Rule in word and deed. Strenuous endeavor brought considerable success, but gradually members resigned till at last the colony was ended.

RUSSELL, HOWARD H.: Founder of the Anti-Saloon League and present state superintendent of the league in New York State; born 1855 at Stillwater, Minn.; by a lawyer in Iowa

from 1878-84, he prepared for the ministry, and was a Congregational clergyman at Kansas City and Chicago until May, 1893, when he originated and started the Anti-Saloon League in Ohio. He has since devoted all his time and talents to the spreading of the league throughout the country. A federation of the churches against saloons has thus been formed in forty-four states and territories, with nearly 400 persons employed, and the league now raises and expends about \$400,000 per year. Dr. Russell is an optimistic opportunist who believes in omnipartizan methods for attaining political results, and he firmly trusts the power of the Gospel and the churches to reform and transform untoward social conditions. He received the degree of D.D. in 1897.

Dr. Russell is author of "A Lawyer's Examination of the Bible" and many articles on the temperance reform. Address: 110 East 125th Street, New York City.

RUSSIA (see also **RUSSIAN REVOLUTION**): An autocracy; the present czar, Nicholas II., emperor since 1894, is descended in the female line from Michael Romanof, elected czar in 1613, after the extinction of the house of Rurik. Peter I. first adopted the title of emperor 1721.

I. Statistics

Area in Europe, 2,122,527 sq. m.—including Poland, Finland, and Ciscaucasia—with 125,161,000 population in 1905; possessions in Asia—exclusive of the southern part of Sakharin, Manchuria, and Mongolia—6,207,662 sq. m., with 19,125,000 estimated population in 1897. Total area of Russian Empire, including inland waters, 8,647,657 sq. m.; population, 144,286,000. The population consists chiefly of Aryan stock—about 100,000,000; 92,000,000 Slavs; there are over 5,000,000 Jews; 17,669,000 Uralo-Altayans, e. g., Finns, Samojeds, Tatars, and Tunguz; 33,600 Hyperboreans, e. g., Eskimos, Chukchis, Kamchadals, Ainns, Korikas, etc. The principal cities are: St. Petersburg, 1,429,000; Moscow, 1,092,360; Warsaw, 756,426; Odessa, 449,673; Lodz, 351,570; Kiev, 319,000; Riga, 282,230; Kishinev, 125,787; Kronstadt, 59,525; Nizhnij-Novgorod, 90,053; Helsingfors, 106,067; Baku, 106,133; Vladivostok, 38,000.

There were in 1901 in European Russia: 4,801,190 births; 3,218,501 deaths; a surplus of births, 1,582,689; and 862,408 marriages. The proportion of illegitimate births was 2.6 per cent in 1901. The increase of population according to religious confessions per 1,000

Vital

was: Mohammedans, 19.8; Orthodox, 15.9; Jews, 14.5; Roman Catholics, 12.0; Protestants, 10.1. Averages per 1,000 population: births, 47.9; deaths, 32.1; increase, 15.8. With the exception of European Russia, where there are 102.9 women to 100 men, the male population preponderates largely over the female, there being, e. g., in Turkestan only 83 women to 100 men.

In the whole Russian Empire there were in 1900: births, 6,142,423; deaths, 3,830,210; surplus, 2,312,213. There were in the total population 71,909,300 males and 72,070,800 females.

In 1905 Russia gained by immigration 390,417, and lost by emigration 473,710; the emigrants were mostly Jews going to the United States (136,093 in 1903).

The Orthodox-Catholic (Greek Church) is the established religion and is supported by the State. The emperor is theoretically the *Summus Episcopus* of the church, altho he exercises that right only in regard to appointments and never concerning ritual and doctrine. Nominally, all religions are tolerated; practically, all but the Orthodox are persecuted, particularly the Jewish. In 1897 the Orthodox and Uniate churches had 87,123,604 members; the Roman Catholic, 11,467,094; the Lutheran, 3,572,652; the Mohammedan, 13,906,972; the Buddhists, 433,863. The Dissidents (Stundists, etc.) from

the Orthodox Church numbered 2,204,596; the Armenian Gregorians, 1,179,241. The Orthodox Church is governed by the Holy Synod. There are 3 metropolitans, 14 archbishops, and 50 bishops. In 1902 there were 49,703 churches—private and public—and 18,946 chapels; 46,827 priests and deacons; and 58,529 cantors. The monasteries numbered 862 with 8,435 monks and 10,000 nuns, besides numerous aspirants of each sex. The expenditure of the Holy Synod in 1906 was: 29,126,155 rubles from the imperial budget, and 1,752,146 from that of the Ministry of the Interior.

Russia has made vast strides in education during the last twenty-five years, both in regard to higher and elementary instruction. In 1873 there were 6,145 students in the

Religion and Education

universities; in 1904, 19,394. There was one school for 2,665 and one pupil for 48 inhabitants in 1885; in 1903 the proportions had changed to 1,533 and 26 respectively. The percentage of the school population was 3.3 of the total, against 21.6 in the U. S. Nevertheless, the percentage of illiterates for the empire is 73 for the population over nine years of age. It is smallest in Esthonia, 30.1; largest in the Steppes, 94. In 1903 there were 90,942 elementary schools with 209,394 teachers and 5,344,747 pupils—3,793 male and 1,551,739 female. The middle schools of various kinds for both sexes number 15.86 with about 413,500 pupils. Higher education is fostered by nine universities and a number of technical and special schools, among which a medical school for women deserves special mention. The State granted in 1906 through its various agencies 76,691,499 rubles for education.

Finland needs separate treatment in regard to education, since its system of instruction is entirely independent of and vastly superior to that of the other parts of Russia. Its percentage of illiteracy is among the smallest in Europe. It has a university at Helsingfors with 1,921 students, among them 328 women in 1904. The school-age lasts from the seventh to the fifteenth year; attendance is compulsory, and strictly enforced.

The great majority of the population of Russia is occupied in agriculture. About 125,613,300 people lived in the country or in villages, and 18,368,800 in cities. The State and the imperial family owned (1905) in

Industry

Russia proper: 393,968,000 acres, or 34.0 per cent; the peasants, 374,634,000, or 32.3 per cent; private owners and towns, 298,307,000, or 25.7 per cent; the remainder, 2,455,000, or 8 per cent, is unfit for culture. In 1899 the State and the crown owned in Poland: 1,808,000 acres, or 5.9 per cent; the peasants, 13,584,000, or 44.5 per cent; private owners, towns, etc., 15,106,000, or 45.0 per cent; unfit for culture, 1,389,000, or 4.6 per cent. In 1904 the areas under crops in the empire were: cereals, 224,730,000 acres; potatoes, 10,318,000; meadows, 92,404,000; total under cultivation, 327,452,000 acres. The crop of cereals of the empire in 1905 amounted to 3,783,810,000 pounds—each equal to thirty-six pounds; that of potatoes, 1,747,446,800; of hay, 2,972,008,800. Transcaucasia produced 17,043,000 gallons of wine in 1899 on 250,675 acres of vineyards; tea planting is also extending in this province. In the whole empire the tobacco crop yielded 99,459 tons in 1903 from 175,720 acres.

The cotton crop is becoming important, chiefly in Turkestan; the yield in 1888 was 325,128 *cwt.* from 214,115 acres; in 1902, 950,320 *cwt.* from 531,037 acres. Transcaucasia produced (1902) 240,000 *cwt.* of raw cotton; Khiva and Bokhara, 628,000. Turkestan produced 2,670,000 *cwt.* of rice and 77,380 *cwt.* of cocoon silk in 1903.

The live stock of the empire in 1904 numbered 29,539,000 horses; 40,564,000 cattle; 64,394,000 sheep and goats; 13,668,000 swine; the number of these animals in European Russia was: 24,051,000; 33,208,000; 47,496,000; 12,197,000, respectively.

A large area of the empire is covered by forests, but only that of European Russia can be estimated with any approach to certainty. Russia proper has 474,000,000 acres of woodland, or 39 per cent; Finland, 50,500,000, or 63 per cent; Poland, 6,700,000, or 23 per cent; the Caucasus, 18,700,000, or 17 per cent. The total for this region is 550,000,000 acres, or 39 per cent of the total area. The State is the largest owner of forests, possessing 64 per cent in European

Forestry

Russia; private owners with 23 per cent come next; peasants with 9 per cent follow; the crown owns 3 per cent, and 1 per cent is divided among municipalities, villages, etc. The total area of the State forests in the empire, including the Amur region, covered 948,073,763 acres; the revenue in 1904 amounted to 60,452,000 rubles; expenses, 11,142,000; surplus, 49,310,000.

Russia is rich in minerals. The output in 1904 was: Gold (unrefined), 37,500 *kilograms*; platinum, 4,933; silver, 1,032; lead, 326 *tons*; zinc, 10,445; copper, 8,480; pig iron, 2,900,000; iron and steel, 2,408,000; coal, 18,620,000; naphtha, 9,942,000; salt, 1,844,000. About 500,000 people were engaged in various mining concerns. In 1903 Russia had 16,713 manufacturing establishments with 1,717,755 employees—1,111,717 men, 399,388 women, 180,881 children, and 19,769 people whose sex and age were not stated. (Textile industries employed 708,186; articles of food, 303,213; metal working, ex-

clusive of mining, 252,215; pottery, 150,809. In 1905 Russia worked 16,280,100 pounds of cotton with 6,554,597 spindles and 154,577 looms; 2,431 distilleries produced 96,788,000 gallons of alcohol; 276 sugar works had an output of 55,596,000 pounds of beet-sugar from 1,391,746 acres under beet-root. In 1903 tobacco plantations covered 175,720 acres, producing 99,459 tons of tobacco, cigars, cigarettes, etc. The manufacturing and financial corporations of various kinds numbered (1903) 1,455 with an estimated capital of 2,015,595,082 rubles in shares—about 20 per cent of which was foreign capital.

Exports in 1905, 1,047,017,000 rubles; imports, 582,086,000. Both exports and imports are made chiefly through Russia's European frontier and the Black Sea. Only 9.2 per cent of the customs duties are from the Asiatic frontier.

The exports consisted chiefly of articles of food, 685,189,000 rubles; raw and half-manufactured articles—chiefly lumber and hides—292,381,000. The imports, chiefly raw and half-manufactured articles, 305,344,000 rubles; and manufactured goods, 155,128,000. Trade was principally with Germany; imports, 232,937,000 rubles; exports, 254,940,000; United Kingdom, 95,471,000 and 249,239,000.

Russia had 3,351 vessels with 666,415 tons in the mercantile marine in 1904—821 steamers with 382,866 tons, and 2,533 sailing vessels with 283,549 tons. The Baltic ports had 5,920 ships entered with 3,850,000 tons; the Black Sea ports, 4,919 with 6,942,000; in the former ports 5,968 ships cleared with 3,920,000 tons; in the latter, 4,866 with 6,902,000. European Russia has 76,500 miles of rivers, canals, and lakes—16,680 navigable for steamers, 8,105 for sailing vessels, 26,800 for rafts. In 1900 about 26,154 vessels with 138,872 men carried 2,402,000,000 pounds of freight on the rivers and canals. The naphtha flotilla of the Caspian Sea numbers 57 steamers and 263 sailing vessels which carried over 30,000,000 cwt. of naphtha.

In 1906 Russia had 40,748 miles of railroads; 32,743 in Europe and 8,005 in Asia. Of this railway net 26,816 miles were owned and operated by the State. In 1897 the railway net amounted in all only to 25,626 miles. The railroads carried in 1905 about 109,166,000 passengers, 7,858,000 pounds of freight, and received 564,800,000 rubles in European Russia exclusive of Finland. The railroads in Asiatic Russia carried 3,605,000 passengers, 254,000,000 pounds, and received 41,694,000 rubles.

The posts are extending with the railways. In 1904 Russia had 100,096 miles of telegraph lines with 256,020 miles of wire, and 87,746 miles of telephone wire. The revenue from these three services was 66,876,037 rubles; expenditure, 40,545,845; surplus, 26,330,192. The figures in 1899 stood: revenue, 29,440,717; expenses, 33,156,423; deficit, 3,715,706. Previous to 1901 these services had always deficits, since that time surpluses.

The ordinary revenue amounted to 2,024,558,452 rubles in 1905; ordinary expenditures, 1,925,176,047; surplus, 99,382,405. Extraordinary revenues, 793,515,197; expenditures, 1,279,576,862. The principal sources of the ordinary revenue were: taxes direct, 126,896,225 rubles; indirect, 408,653,541; duties, 99,995,401; State monopolies, 685,767,651; State domains, 553,049,567; redemption of land, 55,425,756; miscellaneous, etc., 77,729,696. The extraordinary revenue came chiefly from State loans. The ordinary expenditures were chiefly for: war, 378,077,115 rubles; Ministry of Finance, 339,055,502; interest on loans, 306,556,193; navy, 116,694,465. The extraordinary expenditures were chiefly for the war with Japan, 1,137,298,614. The total national debt on Jan. 1, 1907, was 8,375,645,948 rubles, or over 58 rubles per capita.

The army and navy of Russia are being reorganized since the Japanese war in 1904 and 1905, and are at present in a transitive stage. The peace strength of the army is about 1,200,000 men; the war footing, 4,000,000; that of the navy, 69,000 and 100,000 respectively.

Owing to the recent political upheaval in Russia everything is in a state of chaos, and the percentage of offenders is large. In 1901 the total number of persons in prisons was 709,807—631,699 men, 78,108 women; 20,894 of this number were voluntarily following parents or husbands into exile—9,801 men and 11,093 women. The number of persons condemned during 1904 was 58,931; acquitted, 28,620; discharged, 21,354.

II. Constitution

The government is an autocracy, under the czar, Nicholas II. Apart from the Duma (for which see RUSSIAN REVOLUTION), the czar has four chief councils: (1) the Council of the Empire, the members of which he appoints; (2) the Ruling Senate, partly deliberative and partly executive, which promulgates all laws and is the high court of justice; (3) the Holy Synod, which superintends religious matters; (4) a Committee

of Ministers, reorganized in 1905. The empire is divided into 9 general governments, Finland, Poland, Wilna, Kieff, Moscow, the Caucasus, Turkestan, the Steppes, and Irkutsk, each with a governor-general, having full civil and military powers. The governments are divided into 815 districts, with their own administrative institutions, and with special governors over the larger towns. In European Russia the country is divided into communes, groups of which form cantons. The districts are ruled by zemstvos, in some governments made elective, and in which the landowning nobility have the main power. District zemstvos have 60 to 65 members, about half being nobles and half peasantry. Provincial zemstvos are limited to the nobility.

The empire, however, is in a state of transition and details are continually changing. Finland, Poland, and the Baltic provinces are separately governed, and are granted special rights.

RUSSIAN REVOLUTION, THE PRESENT:

The causes that have made Russia revolutionary are as profound as those that have governed the social transformation of any people. The race belongs to one of the highest of the white types, the country is rich and vast, the harmful tradi-

Causes

tions of many other European nations have been absent. The system of immemorial little republics has been spread over the land. The peasants have always governed their village affairs through the most thoroughgoing and democratic of institutions. There has been no vestige of class distinction among them. The property both of the family and of the village has been owned, and to a moderate extent also operated, on social principles rather than on the competitive principles of private property. Along with a rather moderate amount of superstition there is a somewhat pure and sound form of primitive Christianity—a type of religion and morality, if not the highest, at least much higher than that which has during the same period governed in neighboring European countries. The great curse of the land has been not the native institutions, but the barbaric government left by the Tatar invasions and the hard and inflexible bureaucratic conception of government brought in by Peter the Great from Germany in her worst absolutist period. It is, however, impossible in this place to even suggest all the fundamental qualities of the Russian character and the general conditions that have created a nation ready for revolutionary ideas. We must be satisfied with tracing the specific origin of the present revolutionary movement. For this purpose we may divide the history of the revolution into five parts: (1) The Revolution of Ideas; (2) The Revolutionizing of the People; (3) The Revolution in Action; (4) The Revolution of Institutions; (5) The Revolution in the Individual and Society.

Under Peter the Great Russia secured a considerable contact with the ideas of the rest of Europe; but they were imported by Peter himself and forced on the court and officials by autocratic will. Catherine II. pursued an entirely different policy. In bringing to her court Diderot and other leaders of European thought, she did not force her own ideas on the upper classes, but allowed them to see its advantages by personal contact with some of the leaders of European civilization. Again, the Napo-

1. The Revolution in Ideas

leonic wars sent young Russian officers all over Europe, and some of these became so deeply affected as to organize (in 1825) a conspiracy to overthrow czarism. These were the *Decembrists*, and they are still known among educated Russians as the forefathers of the revolution.

About the same time Russian literature began to take a more distinct form, and writers of every kind, from historians and publicists to poets and novelists, were filled with the idea of regenerating Russian institutions. Autocratic Russia, with perfect justification, considered all these ideas to be revolutionary. Even before the emancipation of the serfs (1861) nearly all Russia, which took a pride in its education or culture, was tinged with liberal, radical, and revolutionary ideas. With the emancipation came the effort of tens of thousands of the Russian youth to secure a real knowledge and leadership of the peasantry by living among them. The very act of the emancipation centered the attention of all Russians on the broadest political, economic, and social problems. The brutal treatment by the government of the participants in this movement made martyrs of the best of the Russian youth. Since that time, and for a whole generation, the Russian universities have been centers of revolutionary sentiment, until to-day more than nine tenths of the students of the higher educational institutions are both Socialists and revolutionists, not only in theory but in fact. Tens of thousands have gone to prison or exile for the cause; thousands have been put to death.

The revolution of ideas, however, is by no means restricted to the youth. The educated people of Russia are known as a single class by the name of the "intelligence." The whole intelligence—professors, school-teachers,

The Intelligence

doctors, scientists, journalists, writers, and artists—is permeated with revolutionary ideas. Many of the leaders of the merely liberal parties have for years been members of the Socialist organizations. Russian literature is revolutionary; the Russian press is revolutionary; Russian art is revolutionary. For a century advanced Russians have been expecting sooner or later a complete and fundamental revolution of their institutions. They have looked forward to the time when every person of character, intelligence, and practical capacity should take a part in reshaping Russian society. All Russians of any considerable quality of mind or heart have dedicated a large part of their energy and aspirations toward preparing themselves for the coming change. Russian writers, philosophers, and publicists have realized that they were dealing with a nation whose traditions—whether of religion, politics, or education—have been forced on it from above; and that some day that nation would wish to get rid of those traditions and that there would be created a new type of human society. Like Count Tolstoy, they have not only been studying Russian history and modern ideas in general, but they have given a large measure of their thought and feeling toward the most fundamental, universal, and permanent of human problems: what is the *desirable* evolution of the human type and what is the *desirable* form of society? Perhaps never before in the history of the human race has such an army of gifted and emancipated individuals been given over to the conscious consideration of the development of a new type of man and society.

The results of the work of the intellectuals early began to tell among the people. After the emancipation there were a thousand peasant revolts that had to be suppressed by force

2. The Revolutionizing of the People

of arms. These revolts were not aimed at the overturning of czarism, but at changing the conditions of ownership of land. They were, however, inspired with a spirit of active rebellion against the local and visible arms of the government, and the spirit which was then rife made a very fruitful soil for more fundamental revolutionary ideas. In some Russian villages the revolutionary idea has predominated for more than a generation. Of course such villages are few. The idea of self-government was spreading slowly among the villages when Russia began a sudden industrial development. Soon after the emancipation Russia's financiers discovered the advantage of a high tariff to promote home industry. With the increase of this tariff several industries rapidly grew up during the last two decades of the nineteenth century. In the early "nineties" a second and more important way to develop industrial Russia was discovered. Count Witte began his policy of obtaining enormous loans from France and other countries for the development of Russian railways and other enterprises. Under the stimulus of an immense amount of railway construction, many other industries flourished, and Russia's working class rapidly increased in numbers. The working class was drawn from the villages; but as every peasant has a permanent right to a share in the village property, these working people often return to their villages where they spread the opinions and ideas they obtained in town.

In the late "eighties," and again shortly after the coming of Nicholas II. to the throne, eras of strikes broke out, and the world-wide trouble

The Workers

between employers and employed was introduced in the Russian Empire. With the rise of industry rose also the socialistic ideas, first among the students, and then among the working men themselves. By the time of Father Gapon's petition to the czar (Jan. 22, 1905), which resulted in the St. Petersburg massacre, a very large part of the working men had been reached by the Socialist doctrines carried to them principally by the students long since imbued with the German Marxist ideas. A year after the massacre, at the time of the great general strike, it was evident to the whole world that Russia's industrial working class was fairly permeated with revolutionary ideas.

This spread of socialistic and revolutionary ideas among the city laborers has doubtless been the principal cause for the present revolutionary attitude of the great mass of the Russian peasants. There are few villages that do not have in the midst of them working men who have lived long in the cities, have seen something of the industrial conditions of our times, have taken part in strikes, joined revolutionary organizations, and, finally, participated in revolutionary violence. When the present period of revolutionary violence began, a very large part of the Russian peasants were already converted to an attitude of rebellious hostility toward the government.

Since the war with Japan, the revolutionary ideas gradually called forth action. The beginning of this revolution, and perhaps the beginning

of the peasant revolutionary movement, may be dated from an act of violence. In July, 1904,

3. The Revolution in Action

when the war was at its height, the minister of the interior, Von Plehve, was killed by a member of the social revolutionary party. Von Plehve had embodied in himself every principle of despotism, and had taken into his own hands a large part of the State power. He was a master of the arts of tyranny and had succeeded fairly well in bottling up the revolutionary opinions and movements that were at that time ripening. Russia heaved a sigh of relief at Von Plehve's death.

Von Plehve had not been long dead before a leader of liberal opinion, Prince Sviatopolsk Mirsky, came into power. His advent to the ministry of the interior marked an entirely new period in Russian history. For several months there was a moderate freedom of press and assembly. All Russia took advantage of this freedom to give the spirit of revolution a voice, and protest against the terrible war that had been waged against its will. The reign of comparative freedom did not last long, but it brought the whole of Russia to a condition of extreme excitement. The liberals express their desire for a constitutional government mainly through the congress of the *Zemstvos*, a sort of local government board elected by landlords, which had fallen into the hands of a liberal minority through the inertia of the majority of conservative proprietors. This body was so bold as to ask for a constitution in so many words, naming for the first time in many years a word—*Duma*—that is itself considered revolutionary by servants of the czar. They were soon followed by other public congresses, such as those of the physicians, the professors and school-teachers, the engineers, the journalists and writers. But the aspirations of the merely intellectual classes did not lead directly to any action.

When, however, these ideas of a constitution and a representative assembly for the Russian people, fostered by the revolutionary organizations, came to the ears of the working classes, they quickly made up their minds to act. Since the war, both the economic conditions and the police régime in the factories had become harder than ever. Strikes had become more frequent, and the working people were very rapidly joining

Father Gapon

the most active revolutionary organizations. Father Gapon preached to them the possibility of presenting their wishes directly to the czar with some chances of a favorable hearing. He knew in the first instance that the attempt to present the petition might lead to violence on the part of the troops. The Socialists had made the petition still stronger with the full expectation that it might lead to a violent crisis. The massacre of Jan. 22, 1905, marked the transition of the revolution from a stage of mere conviction and feeling into action. After the massacre the whole situation was changed. All the organizations took on a more distinctly revolutionary tone. They no longer petitioned but demanded, and the language of all the demands clearly suggested the ultimate appeal to force in case of necessity. The labor organizations definitely abandoned the idea of asking anything from the government, and have ever since relied solely on revolutionary means. They are interested in the first and second *Dumas*, and only

want to use them as a means for overturning the government. The organizations of the professions were soon banded together in the Union of Unions which declared for a constitutional assembly. The congress of the *Zemstvos* was held in spite of the government prohibition, and also passed over into a form of action. All the members of the congress pledged themselves to take no part in the functions for the St. Petersburg government.

As to the revolutionary organizations themselves, which had formerly been busy with the general propaganda among the peasants and working men, they now began to turn the larger part of their attention toward the army and navy. The result was hundreds of "strikes"

Mutinies

among the soldiers, the mutiny of a large majority of the total personnel of the army at Sebastopol, Reval, and Kronstadt, and the sporadic mutinies in many parts of Siberia, at Kiev, and in many points in the center of Russia. This was a period of some of the most dramatic events of the revolution—the successful capture by the revolutionists and the holding for several weeks of the cruiser *Kniaz Potemkin*, and the partial destruction of Kronstadt and Sebastopol. However, the government soon mastered the military situation.

In October, 1905, the situation underwent a sudden and fairly complete change. The Union of Unions and the leading labor organizations, especially the railway union, succeeded in spreading the ideas of a general strike. The strike was precipitated by the attempt of the government to arrest the congress of the railway union and destroy the organization. The temper of all the city population and working classes was ready

Universal Strike

for a trial of strength. The railway union declared and succeeded in effecting a general strike on all the important railway lines. A large majority of the factory population followed; the postal and telegraph employees joined in the strike, the street-cars stopped, and even the drug stores were closed. The administration was so complete and effective that the czar and the court party were sufficiently alarmed to listen to the relatively liberal opinion of some of the higher government officials, such as Count Witte, and the czar issued the manifesto of Oct. 17, 1905.

The October manifesto was hailed by a certain rather moderate section of Russian opinion as a real constitution; but it proved to consist of mere promises like many former liberal ukases issued by the czar. The principle of autocracy remained as before, and the czar preserved in fact, if not in principle also, the right to withdraw his promises or to interpret them to suit himself.

Immediately after the sudden forcing of the manifesto in the fall of 1905, when, after the great general strike, the czar became alarmed and promised some sort of a parliament and some sort of individual freedom, some of the more educated and thoughtful members of the bureaucracy endeavored to form an organization which might have a chance of obtaining a measure of popular support. They even hoped, as did the czar and his chief advisers, that this organization might secure a majority in the elections. There could be no better or more stupen-

4. The Revolution of Institutions

Party of Legal Order

dous example of the total ignorance of the czar and his advisers of their own people. This organization, the Party of Legal Order, together with the League of Pure Russian Men and a third reactionary organization composed largely of military officers, obtained altogether not more than half a dozen representatives in the Duma, with all the coercion and police measures of the government to aid them.

The Party of Legal Order secured its more active help among the bureaucracy itself. It is a most conservative organization, but it is after all a political party, and not a semimilitary organization, like the League of Pure Russian Men.

The League of the Seventeenth of October demands something more than law and order. Its ideal government is that of the Prussian state, where not only order and legality exist within the bureaucracy, but where the rights of the individual are adequately protected and where every person has his place in society.

This party, moreover, demands a share for the people in the government. Autocracy, the party claims, is to be preserved, but the control of the government finances is to be shared with a popular assembly. This popular assembly is not, and in fact should not be, entirely elected on a basis of universal suffrage, and the suffrage should certainly not be either equal or direct. These things the czar seemed to have promised in his manifesto of the 17th of October.

All the other parties of importance in Russia are revolutionary. It is a sufficient recognition of their revolutionary character that the government has declared them all "illegal," and that it does not allow them to hold meetings, or to make public or even private propaganda of any kind. The great liberal party in Russia, and the most powerful party in the last Duma under the restricted suffrage, that allowed the peasants and working people only a fraction of the influence of the propertied and professional classes, were the Constitutional Democrats, who later changed their name to that of the Party of the Freedom of the People.

The Constitutional Democratic Party can be easily understood in the light of its leading demand, which is this: that the ministers of the

League of October the Seventeenth
Constitutional Democrats

Duma and subject to its control. It follows that the finances would be in the hands of the popular assembly. Another phase of the program equally important, if perhaps a little less sincere, is the demand for universal suffrage. The bulk of the Constitutional Democratic Party comes from the propertied middle classes of the towns and the relatively prosperous professions. The elections have shown almost certainly that the party can rely on scarcely any support from the working people, and that the majority of the peasants are bent on an even more radical and revolutionary program. The Constitutional Democratic Party has played the most brilliant rôle so far in the political phase of the revolution. By the radical nature of its program, including universal suffrage and the expropriation of the landlords, it was able to demand the cooperation of the still more radical parties in the Duma. By the careful moderation and wisdom of its immediate demands, it was also able to secure the support, in nearly all of its parliamentary action, of the more conservative elements. It was the

leaders of this party that framed the policy of the Duma and drew up the address to the throne—the Magna Charta of the Russian Revolution.

This Russian Magna Charta, it will be remembered, secured the almost unanimous support of the Duma—a most astounding feat and a

Address to the Throne

death-blow to czarism. To-day, on the eve of the second elections, it remains a unifying platform on which all the revolutionary and opposition parties really stand. Of course, other demands are urged before the people, but the leaders are perfectly aware that the fight is most likely to come on the Duma's address to the throne. This address stood for a responsible ministry, universal suffrage, expropriation of the landlords, and last, but not least, complete amnesty of all the revolutionists of every description in prison or exile. For one of the most marked characters of the Constitutional Democratic Party is that, while it has never in any way openly encouraged violence, it has always encouraged the revolutionary attitude of mind, and the individual members have always aided the revolutionists to avoid the clutches of the government both before and after arrest. The Constitutional Democrats are never weary of asserting that the government is so brutal that it has never listened to any argument except that of violence. They are honest and realistic enough to confess their gratitude to the organized violence of the revolutionary parties.

The government was right in calling the Constitutional Democratic Party a revolutionary organization. Immediately after the dissolution of the Duma, it was this party that was largely responsible for the manifesto at Viburg that was signed or indorsed by nearly all its members as well as by practically every one of the members of the extreme left. In that manifesto the government was declared to have broken the terms of the constitution which had already been granted to the people; the refusal of taxes and recruits was advised, and all future foreign loans were declared without legal sanction in the name of the people. The measures of passive resistance, having proved entirely impractical and inadequate as a means for overturning the government, were withdrawn from the party program in the party's congress a few weeks later, but the denunciation of foreign loans remained, and the leading political party in Russia denies to the government the right to secure the means absolutely necessary for its existence, and announces to foreign money-lenders that the future government of Russia will refuse to honor any contract made by the present government in the name of the Russian people. This may not be revolutionary violence, but it is certainly revolution.

All the other parties in Russia, somewhat less important in the first Duma on account of unequal representation, but which have the support of the overwhelming majority of the people, are not only revolutionary in the sense of disobedience to the present orders of the government, but in the sense of open violence against the government and all its tools.

Labor Group

The party which has the best claim to represent the people in the first Russian Duma was undoubtedly the so-called Labor Group. The twenty millions of Russian peasant voters had never participated in an election before. A large majority of about two hundred rep-

representatives sent by the peasantry came uninstruced to the Duma. Over such a vast empire and under the system of police coercion, no organized peasant party had been possible during the elections even if the peasants had conceived a sufficiently clear political idea. But a large majority of the peasants' delegates were radical to the very verge of violent rebellion. Practically the only conservatives among them were those whom the government was able to influence by threats or promises after the elections. The majority, however, unaccustomed to organization, came together shortly after the convocation of the Duma, and formed the Labor Group, which had the adherence perhaps of one fourth or one fifth of the total members of the body. Under a system of universal suffrage they would undoubtedly have controlled it. The Constitutional Democrats, who actually did control it, are demanding universal suffrage, and therefore very wisely and modestly gave more weight to the "group of toil" than its actual numbers demanded. The leaders of this group were consulted in everything the Duma did from the address to the throne to the Viburg manifesto.

The guiding principle of the Labor Group is that of the most extreme democracy. They consider themselves as representing the pauperized peasants and the working people. They demanded a universal suffrage, not in some future Duma, but as a condition of the continued existence of the first popular assembly. They

Demands of Labor Group

demand not only expropriation of the landlords, but also that the terms of this expropriation should be decided by the people of the eighty-nine governments under the direction of the central Duma. They went so far as to demand that the local governments should have the right to declare the land common property and to distribute the landlords' estates on this basis. As is well known, the peasants of nine tenths of the villages of the central districts of Russia, that part which is called Great Russia, own their land on the communal basis. Great Russia contains nearly half the population of the empire, and by its central situation and purely Russian character, has more influence than all the rest. And continued communal ownership of land in this enormous section, as well as in other provinces where the system is more or less in vogue, would very much limit the institution of private property as a basis of the new Russian State.

This party, which claims to represent more than all others the Russian peasants, has been, of course, the center of intelligent interest in Russian affairs the world over. Count Tolstoy expressed recently in private conversation the most natural question concerning it. Wishing to know whether it was composed primarily of peasants or of educated idealists

who are using it as an embodiment of a great social idea, Count Tolstoy asked: "Are the Labor Group working men? Are their hands callous?" The answer was given that a large part of the group, perhaps a third or fourth of the total, do have callous hands. Another still larger part were born peasants and raised as peasants, later receiving the education of a pauper priest's son, of a starving village school-teacher, or of a miserable village official. Another, but much smaller part, have perhaps spent a considerable part of their lives among educated people as newspaper

men, writers, employees of progressive local government boards, or high-school teachers. Still they have lived nearly all their lives in provincial towns and a large part of their lives in the villages, are known to the leading peasants, and they were elected because they were known to understand and represent the peasants' leading ideas. The leaders of the group were Anikine, a born peasant and a village school-teacher; Jhilkin, a St. Petersburg newspaper man, originally from a small town; and Aladyin, likewise from a poor family of a small provincial town, and in turn a university student, an exile, and a professional agitator among the peasants.

The last action of the Labor Group before the government managed to arrest and exile a large part of its members and drive others abroad, was to declare before the people that the government, in closing the Duma, had betrayed the people and was guilty of high treason; that therefore the people owed no allegiance to such a government; that it was the duty

of the army and navy to revolt, and of the peasants as quickly as possible to form local self-governments of their own, and to refuse to obey orders from St. Petersburg. This proclamation was premature and did not have much influence in the army or among the peasantry. However, it finally reached a large part of the Russian villages, and was nearly everywhere warmly and sympathetically received. The peasants were rejoiced that there was a body of men speaking so courageously in their name. But the favorable moment had not yet arrived. The peasants' party—the Labor Group—declared open war on the government, and of course it at once became the object of the oppression of the enormous governmental machine. Its organization was more or less destroyed. Nevertheless, at the time of the second elections, it is still the dominating factor in peasant opinion, and with fair elections and universal suffrage, there can be little question that it would control the Duma. As it is, it is sure to be a powerful influence.

The Labor Group proposed to apply the principles of socialism to the ownership of the land. The Social-Democratic Party proposes to apply

them to all private property and capital. It recognizes, however, that it is first necessary to establish a democratic republic. The Labor Group centered its attention very

Social Democrats

largely on an economic question—that of the land. The Social-Democratic Party is centering all its energies on obtaining a democratic republic, and for that end it considers necessary only the calling of a constituent assembly on the basis of universal, equal, and direct suffrage. This party, which has taken its political and economic philosophy almost entirely from a German social-democratic party, has secured the following of a very large proportion of the city working men as well as of the students, and a considerable part of the professional classes. The more influential part of the party does not expect to achieve any socialistic ends during the present revolution; but it hopes that Russia may go so far in the direction of democracy that the political basis for socialism may be more favorable than in any other land. Another part of the party, also important numerically, hopes that the present revolutionary impulse may last until the revolutionary and socialistic tendencies in

Government Guilty of High Treason

other European countries have also reached a point of fruition. This might create a favorable condition for the foundation of a Socialist state without waiting for a long industrial revolution.

A democratic working men's party in the Russian cities would seem to be an anomaly. Nevertheless, the following of this party among the educated classes, which in truth have dominated it up to the present moment, makes it a center of discussion in Russian politics. In the present elections the question everywhere is how far there may or may not be cooperation between this confessedly revolutionary and socialist party, striving for a democratic republic, and the Constitutional Democrats, who still hope to proceed by an orderly and peaceful evolution to a democratic and constitutional monarchy of the English type. A cooperation of the two parties has been secured in many places, another sign of the revolutionary attitude of the mass of the Russians, for the Social-Democratic Party not only participated in the revolutionary proclamation of the Labor Group, but took part as the most active and often organizing factor in many of the insurrections and all the general strikes. Its fighting organization is ever busy spreading the spirit of rebellion in the army. Its leaders, whenever recognized, are exiled, and members of its fighting organizations are hanged or shot every day, as are those of the other revolutionary parties.

The Socialist Revolutionary Party is the most typically Russian of the revolutionary organizations. It took its origin from the movement of the aristocratic and educated youth toward the people a generation ago, immediately after the emancipation of the serfs. The hopes of all Russia had been stirred by this great and important act. But it was found that the serfs, freed from personal bondage, had become the practical slaves of the police state, and were suffering as much from petty officials as they had been suffering from the landlords. It was also found that they were on the whole in the actual possession of considerably less land than they had before the emancipation act. Their rights over this land were greater, but they were in possession of a lesser part of the fruits of their toil than they had been before. All the great hopes of the Russian youth for a nation to be regenerated from the bottom up, were dashed to the ground, and a great idealistic impulse swept over the land. The youth decided to go and live among the people, to study them, and then to demand a new regeneration of Russia from the basis of actual experience and real fellowship. Of course czarism scented the danger of this movement and it failed. However, the government was so barbarous in uprooting this entirely peaceful revolutionary idea that it pushed a large part of the young people of Russia very far in the direction of violence.

Russia's most typical revolutionary organization owes its importance largely to the fact that it is considered that Russia must in the end be saved by the peasants. It has therefore largely directed its attention to the peasantry. In the governments of Saratof, Kazan, Chernigof, and others, its agitators have succeeded in arousing a large part of the peasantry to the necessity of overthrowing czarism by

violence. The memory of the young students who devoted themselves with such entire sacrifice to an ideal of the popular regeneration of Russia, and the impression of party's power given by its successful act of retaliation on those generals and chiefs of police and other officials who dealt most brutally with the revolutionists, have succeeded in impressing the peasantry with the sincerity and promise of the Socialist Revolutionary Party. In the past two years tens of thousands have gone to prison or exile for the organization, and it is no longer an association of the most radical section of educated Russians, but is also a thoroughly democratic movement.

The Social-Democratic Party regards the first two Dumas largely as a means of preparing for a violent revolution, tho there is some opinion in the party that this may possibly prove to be unnecessary.

There are still other and still more radical revolutionary tendencies in the country. Some of the younger and more determined members of the socialist revolutionary parties went off from the main organization to form the revolutionary group called the **Maximalists**. This organization, however, has nothing to do directly with the elections. Its brilliantly executed series of robberies of large banks, however, have had an indirect effect. The robbery of government institutions is under certain conditions approved by both the large revolutionary organizations. But this does not apply to private institutions. The Maximalists have, however, secured several million rubles in this way, and they have actually succeeded in turning over a considerable part of this money into revolutionary agitation. The dangers of this form of revolutionism even to the movement itself are obvious. A large part of the leaders of the Maximalists have already been executed by the government; the central organization is very loose; and already a part of the expropriated money is leaking into private hands. Nevertheless, Maximalism is an important factor in the revolution, and shows few signs of abatement. It is important as showing at once the limit to which the revolutionary parties are willing to go, and the extremes to which parts of the people are driven by the government. Maximalism, both as regards expropriation of private property and the free killing of lower and irresponsible officials which it involves, has been sweepingly denounced by both revolutionary organizations.

Perhaps one other tendency of revolutionary opinion should be mentioned as it seems a direct result and counterpart of the League of Pure Russian Men, and is equally without real roots in the nation. The league stands for absolute autocracy and for every governmental violence. The small, isolated groups of communist anarchists seem to be most flourishing in Odessa

and in the neighboring cities, where the league is most powerful. They also announce themselves in favor of every form of violence, even the least organized—but *against* the government. Against autocracy they oppose the idea of no government whatever, and they claim to hope that the respect for private property will so far decay before the end of the present revolution that it will altogether cease to exist. Maximalism has proved the cloak for a number of scoundrels, and communist anarchism seems to be principally used

for this purpose. It is well worthy of observation in an effort to understand the revolution, precisely because it has such a limited and scattered following. None of the powerful revolutionary organizations has any relations with it whatever.

The great economic question now and for many years to come will be that of the land. Russia is still an agricultural state, four fifths of the people and a large part of the national wealth being engaged in agriculture. All the advanced and popular parties are agreed that all the land is to be declared the property of the nation, and that it is either to be handed over to the local governments and villages to be leased for short terms to individuals or organizations, or to be let out to individuals by the national government itself for longer terms.

The form of the government in Russia has been largely foreign. Based for a long time either on foreign arms or on foreign mercenaries within Russia, it was later sustained largely to afford an effective obstacle to terrible Tatar or Turkish invasions. At present it is solely by virtue of a

5. Revolution in the Individual and Society

flood of foreign gold that the government is able to sustain itself at all. The true Russian nation is as yet unborn, because neither Russian society nor any single individual in Russia has been able to ignore for a moment the terrible pressure of this almost wholly external régime. The Russian nation has yet to be created, but we can vaguely feel what some of its characteristics must be. The leading Russians in public life to-day are men of a new type, imbued with new ideas of the organization of society.

II. The Second Duma and Its Dissolution

Since the election of the Second Duma, its brief session, and dissolution by the czar, Mr. English has written the editor of the Encyclopedia, from Russia, in brief as follows:

"At last the wishes of the Russian people are known, and at last the Russian people know they have nothing to hope from the present government. Revolution only is left, and is now being prepared for.

"The Russian Moderate Party, that of the Constitutional Democrats, were credited abroad with a large part of the success in the elections to the Second Duma on account of their sweeping victories in Moscow, St. Petersburg, and other cities—where the impossible election law allowed the middle classes ten electors to the working men's one. But to have seen in the elections a victory only of the Moderates, was to fail entirely to grasp the import of the Second Russian Parliament.

"Surely Prof. Paul Melyukov, leader of the Constitutional Democrats, was fitted to speak finally on the question—whatever may have been the perversions of the governmental press, and on Feb. 22d, after some five hundred members of the Duma had been elected, Professor Melyukov said:

"'We have had a truly unexpected defeat. The Extreme Left has triumphed. It is the first example in history of a parliament in which there is an absolute majority of Socialists.

"'We are on the verge of a grave crisis,' he continued. 'The Socialist parties have detached themselves from us and are independently pur-

suing their own way. The majority of the country is following them. For I must confess that without the enormous arbitrariness of the government the Duma would be even more Socialist than it is.'

"The Moderates as well as the government did indeed meet a defeat at the hands of the definitely revolutionary parties. In the

Composition of Second Duma First Duma there were 18 Social Democrats and Social Revolutionists; in the Second there were more than 60. In the First there were some

85 peasant Socialists; in the Second nearly twice that number, while the then 160 Constitutional Democrats were reduced to about one half their former strength. The declared Socialists may not have mustered quite a majority, but they have supporters in progressives and independent members of the Left who were elected by Socialist as well as Moderate votes and were often privately known as Socialists.

"Such a Duma could not last. Between the present Russian Government and the Group of Toil, conscious of having the people back of them, there can be no peace. When the government found what the people of Russia want and that their representatives in the Duma intended to get it, the only thing to do was to dissolve the Duma and not to appeal to the people again. Not to have done so would have been to have abdicated."

III. Postscript, July, 1907

The Second Duma has proved to be the last. The czar's ukase of June 16th amounts to a *coup d'état*, the final abolition of the last guaranty of constitutional government and a return to the traditional absolutism and autocracy of the czarism. The new election law provides for what the government is pleased to call "another Duma," but the new body will be shorn even of that shadow of real representative character and legislative power enjoyed by the former assemblies. It is doubtful if Russia's hundred million peasants or her ten million working people will be able to send a single representative to the new "parliament." This is not even that half-parliamentary body known as a Duma, it is more like the ancient zemsky sobor, in use in autocratic Russia several centuries ago. It is a House of Lords, a body of landlords and rich burghers with whose aid the government hopes to delude the world that its budgets and foreign loans are ratified by a national parliament.

The conclusion from the Dumas then is this: The government made its brief experiment with semiparliamentary methods solely for financial reasons. The revolutionary movement was certainly not strong enough to maintain the institution; it was probably a very minor influence in creating it. The revolution and the government are, broadly speaking, where they were before—the government in supreme control of all the wealth and physical forces of the nation, the revolution supreme mistress of public opinion. But this great and incalculable change has taken place. The government thought it could find support among the peasants and other elements of the people. It now sees that practically the whole population, except the wealthiest classes, are with the revolution, and that it must rely more than ever on the sheer violence by which it

has always maintained its power. The revolutionary nation has seen that there is no hope that the government will soon collapse, as it were, of its own accord; that there is no chance of financial necessity forcing it to give freedom, representative government, or any fundamental reform, and that the nation must, therefore, rely solely on its own necessarily illegal power since the now thoroughly alarmed government has again become the sole arbiter of the law. The Russian

people, therefore, see before them a long, bitter, and violent struggle, infinitely more costly than all that has gone before. But they are now certain of their own numerical and moral power, they are united on the end to be attained and in agreement that revolutionary means are necessary to attain it. The revolution continues, ripened by the recent struggle and enlightened by the new experience it has gained.

WILLIAM ENGLISH WALLING.

S

SAINT-SIMON, CLAUDE HENRI, COMTE DE: Social reformer; born in Paris, 1760, of a noble family, tracing its origin to Charlemagne. He entered the army at sixteen, and a year afterward came to America and fought under Washington. He distinguished himself for bravery. Returning to France he was made colonel, but soon gave up the military career. He visited Mexico and started a project for uniting the Atlantic with the Pacific by a canal, and for a canal from Madrid to the ocean. But the French Revolution drew him to France. In spite of family traditions, he sided with the people, and was elected president of the commune where his property was situated. He renounced his title of count, but this did not prevent his imprisonment for nearly a year on account of his nobility. Acquiring some money by speculation he contracted an unhappy marriage, which was later dissolved. He began scientific studies, and in order to acquire a complete knowledge of life plunged deliberately on occasions into dissipation. When his money was spent and his health broken, he changed his mode of life and became a copying clerk, working nine hours a day for less than \$200 a year. It was not till his forty-ninth year that he felt himself fully qualified to appear as a social reformer. He wrote two works—"Sur la Science de l'Homme" and "Sur la Gravitation Universelle." His characteristic Socialist views were first developed in "L'Industrie" (1817), and further developed in "L'Organisation" (1819), "Du Système Industriel" (1821), "Catéchisme des Industriels" (1823), and most important of all, "Nouveau Christianisme" (1825). In the latter work, having previously called in vain upon the pope to head a new crusade of the Church against poverty and suffering, he outlines a new Christianity where with religious fervor the world should be exploited in a scientific way, and society organized for the benefit of the poor and of all classes. His works, however, at first elicited little attention.

At sixty years of age his marvelous tenacity gave way, and, influenced by despondent thoughts, he attempted suicide. This brought dilatory friends to his side, and he rallied and set to work again. In 1825 he died in the midst of his followers. One of them has chronicled his last words. Calling his friends around him, he said:

"You have arrived at a period when, by your combined efforts, you will achieve a great success. The fruit is ripe; you are able to gather it. The last of my labors, the 'New Christianity,' will not be immediately understood. It has been thought that every religious system ought to disappear because men have succeeded in proving the weakness and

insufficiency of Catholicism. People are deceived in this. Religion cannot disappear from the world; it can only be changed.

He paused for a few moments, then, in the final struggle, added: "The Party of Laborers will soon be formed; the future is ours."

Professor Ely says, in speaking of Saint-Simon:

Saint-Simonism is the first example of pure socialism, by which I understand an economic system in which production is entirely carried on in common, and the fruits of labor distributed according to some ideal standard, which appears to the promoters of the scheme just. The Saint-Simonians held that men were by nature unequal, and that it was right to reward superior power, when exerted for the general good. Their idea was that each one should labor according to his capacity and be rewarded according to the services rendered. They wished to organize civil society on the plan of an army. This thought is distinctly expressed by one of their leaders in these words: "In the army gradations in rank and authority are already established, while in civil life that is precisely what is wanting; and in an enterprise conducted upon the principle of association, a central administration is imperiously required." The officers are the directing authority in the scheme, and they decide on the value of the services rendered to society and reward the citizens accordingly. As society consists of priests, savants, and industrials—the industrials comprising those engaged in manufactures, agriculture, and commerce—so the government consists of the chiefs of the priests, the chiefs of the savants, and the chiefs of the industrials. All property belongs to the Church, i. e., to the State, and every profession or trade is a religious exercise and has its rank in the social hierarchy.

After Saint-Simon's death his followers became numerous, especially about 1830, under the leadership of Enfantin and Bazard (*qq. v.*). The *Globe*, their organ, attracted much attention. Brilliant men like Comte and Thierry belonged for a while to their school. They attempted a community at Menilmontant, but it broke up finally in a split on the subject of marriage (see BAZARD).

The Saint-Simonians regarded all idlers as thieves. They therefore rejected inheritance, and asserted that every man's property at death should become common. All should start with equal advantages. Land, capital, and all the instruments of labor should be held in common. They believed in monogamy, that woman is the equal of man, and that the social unit should not be man, but man and woman. They believed that "the exploitation of man by man" should be replaced by the exploitation of the globe by man associated with man. They would organize society on scientific lines to develop the globe scientifically. Several of the school after its break up became civil engineers and took part in opening the Isthmus of Suez and other works.

SALT, HENRY STEPHENS: Hon. Secretary of the Humanitarian League; born at Nyneeb Tal, India, 1851; educated at Eton and King's College, Cambridge, England. Assistant classical

master at Eton College, 1875-84; turned to literary work and questions of social reform. Editor of *The Humanitarian* and *The Humane Review*. Mr. Salt has also written a large number of pamphlets and magazine articles on literary and humanitarian subjects. He is a Socialist, a vegetarian, and freethinker, and believes that the ethics and religion of the future will be based on the recognition of the kinship of all sentient life. Author: "Percy Bysshe Shelley, Poet and Pioneer"; "The Life of Henry D. Thoreau"; "Richard Jefferies, His Life and His Ideals"; "De Quincey"; "The Life of James Thomson" (B.V.); "Animals' Rights"; "The Logic of Vegetarianism." Address: 53 Chancery Lane, London.

SALTER, WILLIAM MACINTIRE: Lecturer of the Society for Ethical Culture, Chicago, Ill.; born at Burlington, Iowa, 1853. Graduated from Knox College, 1871; Harvard Divinity School, 1876; studied at Göttingen, 1876-77; School of Political Science, Columbia University, 1881-83. While at Columbia he came under the influence of Felix Adler (q. v.) and the ethical movement. He began lecturing on similar topics in Chicago, 1883; agitated for the eight-hour day and against the wholesale sentence of the Chicago anarchists, 1887; and organized the "Economic Conferences between Business Men and Working Men." In 1892 he removed to Philadelphia, where he assisted in the formation of the "Toynbee Club"; espoused the grievances of the street-car employees, and agitated against the Russian Treaty. In 1897 he returned to Chicago and founded the Henry Booth House.

Mr. Salter considers scientific socialism—which means action by society to social ends—and individualism—which means action by individuals for private ends—to be complementary tendencies, and both necessary. He is the author of "Ethical Religion" (1889); "First Steps in Philosophy" (1892); "Anarchy or Government? An Inquiry in Fundamental Politics" (1895). Address: The Society for Ethical Culture, Chicago, Ill.

SALVATION ARMY, SOCIAL WORK IN THE UNITED STATES OF THE: The learned writer who referred to the man who could by the alchemy of science produce two blades of grass where only one had hitherto grown as a public benefactor, spoke truly and well, but it will not be thought out of place, at any rate by those who have been generous enough to take more than a cursory glance at the social branch of our many-limbed Salvation Army tree, if I say that with the life-giving sun-rays of the warm, rich blessing of Almighty God ever descending upon it, and the refreshing dews of His power and love nourishing the tender shoots, it is causing moral and spiritual grass to grow in hitherto totally barren spots, and if "the desert" has not as yet altogether been made to "blossom as the rose," beautiful human flowers have been produced in this reclaimed soil in sufficient numbers to prove the possibility of mighty fragrance for future days and to induce within us the twin graces of courage and hope to prosecute the beautiful work of soul-culture with greater zest and vigor than ever.

If it could be brought about that vital Christianity could enter as a leaven into our strenuous twentieth-century life, and society at both ends,

and all the way through, adopt it as a life-principle, the problems of sin and suffering would soon be solved. Failing this, we must be content for the time being with the ones and twos and threes and fours—with the individual reformation of the victims of depravity and vice, their rehabilitation and spiritual and moral uplift.

Down in the depths—the inferno of human sin, degradation, misery, and squalor—our forces are persistently, courageously, and hopefully at work. They are thoroughly organized, constant in their endeavor to scatter sunshine in shady places and to carry light into dark corners, and they know neither faltering nor hesitation. Wherever there are poor neighbors, slums or red-light districts, with the sin-stricken and poor, you will find them at work. Our officers do not meddle with metaphysics but deal with world problems. They are neither deterred by summer's heat nor winter's cold. They fear not the pestilence that walketh in darkness or the destruction that wasteth at noonday.

The Salvation Army's system of relief lasts all the year round, and it is impossible to tell whether gaunt Poverty in its greatest hideousness is greater in summer or winter. Certain it is, our hands are kept just as full and our brains just as busy at one season as the other, and, to make the truth complete, there are no gaps between.

Our precious officers, whose training has taught them to become the servants of all men and to minister to the wants of the most needy, never regard their work as finished. There is always the need of ministry as long as the necessity exists, whether it is in the line of finding work for the unemployed, persuading the would-be suicide to make a new trial of life, giving the ex-convict an opportunity to redeem the time that "the locusts have eaten," restoring lost ideals to the fallen girl, endeavoring to raise the orphan to a proper Christian citizenship, paying rent for those in danger of eviction, providing summer camps for slum dwellers and Christmas dinners for the hungry, gathering up the thousand ends of our Salvation life-line and throwing them to those in danger of engulfment in the chill waters of despair—truly if the labors of any can be literally measured up to the scriptural standard of "in season and out of season" it is theirs. They assist humanity from the cradle to the grave. The lives of new-born babes have been saved by our consecrated slum lassies, and it is no less true that the death-beds of the aged have been cheered and the path into eternity smoothed and Christian burial given by them where those less Christlike might have been tempted, more or less justifiably, perhaps, to regard the friendless dead as of little moment—merely a repetition of "Rattle his bones over the stones" to the poor man's Golgotha known as Potter's Field.

That it may be perfectly clear in the reader's mind what I mean by our social work, I will state that it is composed of those branches whose principal duty is not mainly the conducting of religious services and engaging in strictly spiritual ministrations—dealing with the soul of man in contradistinction to his body. While thus stating, I must be just as insistent in placing the

two side by side. In fact, the twain are so indissolubly wedded that they cannot be separated. Our social work sprang from the fact that a man's soul could not be well reached and benefited while his body was suffering or his material

circumstances were such as to preclude the blessing received from becoming permanent.

The strong aiding the weak, and the weak strengthening the strong in numerous subtle ways; out of it comes the perfect Christian whole which Jesus Christ meant when he instructed the righteous, law-abiding but unsatisfied young ruler thus: "If thou wilt be *perfect*, go sell all thou hast and give to the poor, and thou shalt have treasure in heaven." It was not enough that he was a model son, a model citizen, an upright and generous neighbor; the personal touch was lacking, the warm, vitalizing, divine love that would gladly spend and be spent for the poor, sinful, wayward brother-man; for it was this sort of a life Jesus invited him to when He added, "And come and follow Me."

Twain are joined together; the social leans against the spiritual, the spiritual supports the social, one against the other. To separate them would mean the collapse of the whole, and out of the union rises that grand, that most magnificent work of God's—man; man made in His own likeness, man risen from the ruins of awful pasts, man degraded, cast out, all image of God obliterated by years of hideous sinning, helped up, propped up, held up by his brother-man, and in his turn bringing forth in his fellow a host of divine graces—pity and sympathy and long-suffering patience and a love second only to that of Jesus Himself.

The social without the spiritual would be as an engine without steam, and the spiritual without the social would be to neglect that part of the whole duty of man that teaches us "to deal bread to the hungry" as well as to keep "unspotted from the world." Thus we believe God meant the combination to be, forming the only perfect and successful federation that comprizes the brotherhood of man.

Our latest social figures (for the year 1906) comprize the following:

STATISTICS

| | |
|--|-----------|
| Number of industrial homes..... | 65 |
| Accommodation..... | 1,686 |
| Number of men admitted during the year..... | 8,696 |
| Number of men passed out during the year..... | 8,552 |
| Total number of meals supplied..... | 1,318,044 |
| Total number of beds supplied..... | 463,550 |
| Number of working men's hotels..... | 77 |
| Total accommodation..... | 7,990 |
| Total number of beds supplied..... | 2,124,837 |
| Number of colonies..... | 3 |
| Number of acres..... | 2,569 |
| Total number of persons..... | 428 |
| Number of new cases of missing friends searched for..... | 1,194 |
| Number found..... | 210 |
| Number of rescue homes..... | 22 |
| Accommodation per night..... | 599 |
| Admitted during year..... | 1,701 |
| Number passed out during year..... | 1,724 |
| Number of meals supplied..... | 739,930 |
| Number of children's homes..... | 4 |
| Accommodation..... | 225 |
| Number in home at end of year..... | 180 |
| Number of beds supplied..... | 71,700 |
| Number of meals supplied..... | 197,000 |
| Number of slum posts..... | 20 |
| Number of families visited..... | 26,290 |
| Number of persons temporarily assisted..... | 38,303 |
| Number of tons of coal distributed..... | 275 |
| Number of pounds of ice distributed..... | 836,412 |
| Christmas dinners supplied..... | 302,000 |
| Total number of persons found temporary or permanent employment..... | 66,621 |

COMMANDER MISS BOOTH.

SALVATION ARMY COLONIES (United States. For England, see **LABOR COLONIES**).

This enterprise now comprizes three colonies:

1. Fort Amity, in Colorado, in the fertile valley of the River Arkansas.

2. Fort Romie, in California, not far from the famous Hotel del Monte, near the Bay of Monterey.

3. Fort Herrick, in Ohio, about twenty miles from the city of Cleveland.

Early in April, 1898, a section of land, consisting of 640 acres (since increased to nearly 2,000 acres), was purchased in the neighborhood of Holly, on the line of the Atchison,

Fort Amity
Topeka & Santa Fé Railroad, 267 miles east of Denver, in the valley of the Arkansas River. An abundant

supply of water from the Buffalo Canal is supplemented by a still more abundant subsurface underflow. Hence this colony is the most important we have on hand, with an almost unlimited opportunity for expansion. The soil is rich and the climate superb, the elevation being some 3,500 feet above the level of the sea, thus avoiding the extremes of heat and cold. The mining camps of Colorado afford an excellent market on the one hand, while on the other the colony is on the highway to the principal cattle markets of the mid-Western states, being linked to both by the Santa Fé Railroad.

The principal crops include the famous "netted gem" cantaloup, for which Colorado has gained so great a reputation.

The establishment of a sugar-beet factory by the American Sugar-beet Company in the valley of the Arkansas River, within easy reach of our colony, has brought to our very doors another valuable crop for which good prices can be obtained upon the spot.

A large stone building, hitherto occupied as an orphanage, is now transformed into a sanitarium for consumptives, the children having been transferred to our other orphanages in the East and West. The magnificent climate marks out this colony as peculiarly suitable as a location for a sanitarium.

Two schoolhouses have been erected by the county in the center of our colony. A post- and money-order-office has also been established. The recent erection of a freight depot and siding by the railroad company has further enhanced the value of our colony and improved its prospects, while arrangements have just been completed for the erection of a passenger depot.

There are now about 400 colonists, including men, women, and children, on our Fort Amity Colony.

About twenty small stores have been established on the town site, and an artesian well supplies the settlement with pure drinking water.

Nestled in the beautiful valley of the Salinas, near the Bay of Monterey, is our California colony.

Fort Romie
A fine sweep of over 500 acres of rich agricultural land has been purchased. Cottages have been built and the land divided into ten- and twenty-acre tracts, while an irrigation pumping plant has been erected, supplying water from the adjoining river. There is also a gravity canal.

The soil is admirably suited for potatoes and alfalfa, as well as for almost every other variety of agricultural produce.

There are now about 120 colonists, including men, women, and children, upon this colony,

and one of the families has already paid for its land.

Within about twenty miles of the city of Cleveland and close to the childhood home of President Garfield, is a beautiful sweep of level land, fringed with wood and covering some 288 acres.

Fort Herriek

The owners of the land, Hon. Myron T. Herrick, governor of Ohio, and Mr. James Parmelee, have deeded the land to us for colonization purposes. This extremely generous gift has given a splendid start to our Ohio colony, and we fully intend to make it a model institution of the kind. Owing to its location and character this colony has partially assumed an industrial character, which will make it of the utmost importance as a training-ground for future workers.

SALVATION ARMY AND SOCIAL REFORM

(International. See also "Salvation Army, Social Work in the United States," by Commander Miss Booth; Salvation Army Colonies).

The Salvation Army, which was organized under that name in 1878 by General Booth as an outgrowth of the Christian Mission he had established in East London in 1865, commenced in 1890 a social reform movement. With the strictly religious portion of the work of the Salvation Army we do not deal in this Encyclopedia, tho it should be recognized that the Army never divorces its social from its more strictly spiritual work, and believes that to do so would be fatal. It believes also, however, that the social work needs the spiritual element, and it was in this thought that in 1890 General Booth wrote and published "In Darkest England," a book which at once arrested attention around the world; partly because of its revelations of the destitution and wretchedness in London and all England, and even more because of the plan for social work that the book proposed in clear, business-like form.

General Booth prefaced his plan by laying down seven propositions, which in his opinion should govern such a plan, which we abridge from his book, as follows:

The first essential that must be borne in mind as governing every scheme that may be put forward is that it must change the man, when it is his character and conduct which constitute the reasons for his failure in the battle of life. No change in circumstances, no revolution in social conditions, can possibly transform the nature of man. Some of the worst men and women in the world, whose names are chronicled by history with a shudder of horror, were those who had all the advantages that wealth, education, and station could confer, or ambition could attain.

Principles

The supreme test of any scheme for benefiting humanity lies in the answer to the question, What does it make of the individual?

Secondly.—The remedy, to be effectual, must change the circumstances of the individual, when they are the cause of his wretched condition and lie beyond his control.

Favorable circumstances will not change a man's heart or transform his nature, but unpropitious circumstances may render it absolutely impossible for him to escape, no matter how he may desire to extricate himself. The first step with these helpless, sunken creatures is to create the desire to escape, and then provide the means for doing so.

Thirdly.—Any remedy worthy of consideration must be on a scale commensurate with the evil with which it proposes to deal. It is no use trying to bail out the ocean with a pint pot. The evil is one whose victims are counted by the million. There must be no more philanthropic tinkering, as if this vast sea of human misery were contained in the limits of a garden pond.

Fourthly.—Not only must the scheme be large enough, but it must be permanent. That is to say, it must not be merely a spasmodic effort, coping with the misery of to-day.

Fifthly.—But while it must be permanent it must also be

immediately practicable. Any scheme, to be of use, must be capable of being brought into instant operation with beneficial results.

Sixthly.—The indirect features of the scheme must not be such as to produce injury to the persons whom we seek to benefit. It is no use conferring sixpenny-worth of benefit on a man if, at the same time, we do him a shilling's worth of harm.

Seventhly.—While assisting one class of the community, it must not seriously interfere with the interests of another. In raising one section of the fallen, we must not thereby endanger the safety of those who with difficulty are keeping on their feet.

Of his proposal General Booth said in brief:

The scheme I have to offer consists in the formation of these people into self-helping and self-sustaining communities, each being a kind of cooperative society, or patriarchal family, governed and disciplined on the principles which have already proved so effective in the Salvation Army.

These communities we will call, for want of a better term, colonies. There will be:

- (1) The city colony.
- (2) The farm colony.
- (3) The over-sea colony.

To-day the Army's operations are carried on in 49 countries and colonies, embracing 7,210 posts, under the charge of 16,857 officers and employees, with 45,339 local officers, 17,099 brass bandmen, and about 50,000 musicians. Sixty-three periodicals are published in 31 languages, with a weekly circulation of about 1,207,223. There are 644 social relief institutions in the world, under the charge of nearly 3,000 officers and employees. About 7,000 fallen women annually pass through the 116 rescue homes, and from 80 to 90 per cent of these are permanently restored to lives of virtue. About 1,500 ex-convicts pass annually through the prison-gate homes. There are 132 slum settlements in the poorest districts of great cities, the worst dives, saloons, and tenements being regularly visited. The number of annual conversions in connection with the spiritual work have averaged from 200,000 to 250,000 during the past 10 years, making a total of over 2,000,000 of whom not less than 200,000 were converted from lives of drunkenness.

The Army's international headquarters are at No. 101, Queen Victoria Street, London.

SANBORN, FRANKLIN BENJAMIN: Journalist and publicist; born at Hampton Falls, N. H., Dec. 15, 1831. Educated at home and Harvard College (B.A., 1855). He took part in the expulsion of slavery from Kansas, 1856-58; favored John Brown in his attack on slavery in Virginia and Missouri. He assisted in the organization of public charities in Massachusetts, 1863-88, and aided in founding the Social Science Association in 1865; of the National Conference of Charities, 1874; of the Concord School of Philosophy, 1879-88; and of the Anti-Imperialist League, 1900. In social reform he favors the gradual improvement of the condition of the poor and the limitation of inordinate wealth in a legal manner. He is the author of lives of Bronson Alcott, Emerson, Thoreau, Dr. S. G. Howe, John Brown, etc. Also editor and writer of numerous reports on charity, prison reform, and history of New Hampshire. Address: Concord, Mass.

SANDERS, WILLIAM: Organizing secretary of Fabian Society; born 1871; educated in elementary schools of London. Secretary of the political labor organizations of Battersea, London, until 1900. Elected, 1904, alderman of the London County Council, term expiring 1910. In

1906 he contested Portsmouth as parliamentary labor candidate. Sanders has written and lectured extensively on labor, social questions, and socialism; he was chairman of the Union of Ethical Societies from 1905-7. Address: 3 Clements Inn, Strand, London, W. C., England.

SANGER, SOPHY (MISS): Honorary secretary British Association for Labor Legislation; born 1881, Westcott, near Dorking, Surrey. Educated at Newnham College, Cambridge, where in 1901 she took the Mathematical Tripos, Part I., and in 1903 the Moral Science Tripos, Part II., Economics. Miss Sanger has been honorary secretary, Legal Advice Department of Woman's Trade Union League, since Oct., 1903. She is strongly in favor of free trade, and specially interested in labor legislation and trade-unionism. Author of miscellaneous articles and lectures on labor legislation and trade-unionism. Address: Women's Trade-Union League, Club Union Buildings, Clerkenwell Road, London, E. C.

SANITARY SCIENCE AND PUBLIC HYGIENE: The division of medical science and hygiene which treats of the preservation of health, prevention of disease, and the prolongation of life, particularly in application to communities. The factors which condition public health are: (1) the environment; (2) proper action by the citizens to prevent disease; (3) the individual care of health so as to enjoy and prolong life.

1. Few individuals are able to live in surroundings chosen by themselves. Economic, social, and climatic factors largely determine the selection of sites for villages, towns, and cities. If these are not healthy, owing to conditions of the soil or drainage, the individual is practically helpless, and it becomes the duty of the public authorities to correct them as far as possible. The correction of conditions dangerous to health requires, however, special study and, in large cities, special departments. Owing to this necessity, various boards and departments have been established, e. g., that of health, whose function lies in the realm of examining foods, supplying pure water, etc., that of street cleaning, tenement-house inspection, regulation of buildings, etc.

The necessity of passing sanitary laws was recognized in England in the times of Henry VIII. and of Elizabeth. They were, however, not observed, because there was no board to enforce them. The invasion of the Asiatic cholera, causing the death of 70,000 persons in a single year, brought the question to the fore again. Legislation was busy, but the laws were ineffective, and several epidemics were the result. Finally, in 1848, laws were enacted which were effective, because they made provision for special boards to enforce them. France had passed similar legislation in 1832, which has become the model for other Latin countries; in these countries the prefect, mayor, or any other chief official looks after the enforcement of the sanitary laws, which are passed on the recommendation of *councils of health*. In Germany the medical faculties of the universities have taken the initiative, and the government passes and enforces corresponding legislation. In England and America the federal, state, and municipal constitutions usually provide for the creation of boards or bureaus of health, under whose supervision come all endemic, contagious, and epi-

demic diseases, and other matters pertaining to public health, e. g., sanitary codes, purity of food-supply, water-supply, vital statistics, etc.

Efficient street cleaning is one of the most important civic functions. The magnitude of the problem may be inferred from the facts that

Greater New York employed in 1906 2,455 sweepers who covered 1,581 miles a day, and 1,316 drivers of carts; over 1,000 tons of refuse is taken to Barren Island each day, and an addition of 233 acres is going to be made to Riker's Island with the balance of about 1,200,000 cubic yards per year. Refuse also must be disposed of so as not to endanger the health of the city. This is no small task, since the waste is enormous in bulk. Various means are used, e. g., incineration, dumping into the deep sea, making new land, etc., or by saving the valuable parts—for which a contractor pays \$650,000 in New York City alone. Several English and continental cities carry on profitable municipal farms with the refuse. (For tenement-house inspection and bureaus of buildings, see articles TENEMENT-HOUSE REFORM and HOUSING.)

2. The instruction of citizens concerning ways and means how to prevent disease is a new departure in sanitary science. It is, however, becoming more important every day, and involves directions how to dispose of the waste in houses, and the inculcation of sanitary rules into the

minds of children. The first is done by directions of the board of health, and requires that they should be plain and simple. The instruction in preventive measures is done chiefly in the schools, in the departments of civics, physiology, and hygiene. Great progress has been made in the art of teaching children the simple tho necessary rules of both private and public rules of health. Colonel Waring, the first street commissioner of New York, gave the school children an opportunity to apply their knowledge to the problems of street cleaning by forming juvenile leagues for this purpose. The leagues were organized in 1896; they had their own constitution, officers, etc., and weekly business meetings, at which they discuss means and ways how to keep the city clean. The boys and girls did not confine themselves, however, to discussion, but reported lawbreakers to the department, warned offenders, and tried in every way to keep their own blocks free from garbage and refuse. The league had a monster parade in the latter part of 1896; similar organizations were started in other cities, e. g., Denver, Pittsburg, Utica, Philadelphia.

Another manner in which cities as a whole may be taught preventive measures, is that by inculcating the value of fresh air and outdoor life, and by the creation of parks, and the provision of opportunities for exercise in the open air. (See articles PARKS; PLAYGROUNDS; RECREATION CENTERS.)

3. The individual care of health involves proper food, clothing, exercise, and personal cleanliness. A vast amount of research work has been done concerning the value of various foods in recent years, and their respective costs. Tables and other helps, showing the proportion in which different foods should be partaken, have been compiled, so that

Street Cleaning

Teaching

Boards of Health

Individual Care of Health

any one may know just what to eat and what to avoid. Dietetics has, consequently, become one of the most important divisions of sanitary science. Similar studies have been made about clothing, as to their ability to keep the body warm in winter, cool in summer, and at all times dry. Exercise is necessary for the development of the muscular system, for the improvement of digestion, and for the more rapid throwing off of waste substances of the body. Sanitary science has made extensive studies in regard to the particular kind of exercise which different individuals need in order to be benefited rather than injured by it. Personal cleanliness is more and more recognized as an important item in the preservation of health and the prolongation of life. Acting on the frequently and urgently made suggestions of public health officers, nearly all large cities have erected public bath-houses at large expense in order to enable those of their population to bathe whose means do not permit them to have baths in their homes. (See article BATH-HOUSES.)

Sanitary science has made vast strides in every direction since the discovery of disease microbes by Louis Pasteur in 1865, and many thousands of lives have been saved from tuberculosis, diphtheria, cholera, and other ravaging diseases.

The supply of water is one of the most pressing needs of large cities. The question is, where to get it? Owing to the density of population in most civilized countries, the amount of sewage is so vast that it is likely to infect drinking-water, even if it be taken five or ten miles away, because microbes are hard to kill. The problem is, consequently, not only to provide for clean and pure water, sometimes from a distance of fifty to 100 miles, but to disinfect sewage, because water will have to be taken from rivers which have received a large amount of sewage. Cleveland, Ohio, solved the problem by removing its water intake pipes about ten miles out into the lake; the result was that the deaths from typhoid fever in 1905 numbered 2 for February, 5 for March, 7 for April, instead of 45, 50, 27, for the corresponding months in 1904. The city of Lawrence, Mass., had to resort to filters, because she had to take her water from the Merrimac River, already polluted with the sewage of three large manufacturing cities farther up-stream. The study of microbes had taught biologists that sand in some way or other was dangerous to the typhoid bacillus. Lawrence constructed huge sand filters, covering 2.5 acres; and when two years later a typhoid epidemic broke out at Lowell—an event which previously had invariably meant a heavier siege for Lawrence—the death-rate in the latter city was only 20 per cent of what it used to be.

In a similar way another dread disease, diphtheria, has been made practically harmless through the study of microbes. In 1890 Dr. Emil Behring announced his discovery of the cure for diphtheria by the antitoxin of the bacillus which produces this disease. Detroit, Mich., New York City, and some other large cities now keep a number of horses for the sole purpose of preparing antitoxin in their blood. The death-rate for diphtheria has been reduced from 40 to 8 per 100. The discovery of other bacilli, e. g., of hydrophobia and of yellow fever, has led to respective preventives in each case. (For the modern treatment of consumption, see article

TUBERCULOSIS, and for that of smallpox, VACCINATION.)
RUDOLPH M. BINDER.

SAVINGS-BANKS: The first savings-bank is said to have been founded in Brunswick, Germany, in 1765, and to have been followed by several in Germany and Switzerland. In England Jeremy Bentham (*q. v.*) proposed a well-devised system of "frugality banks" in 1797. Various plans followed his encouraging savings among the poor, but the first savings-bank of the modern type in Great Britain was organized by the Rev. Henry Duncan, of Ruthwell, Scotland, in 1810. In 1817 two acts were passed by Parliament encouraging savings-banks. Since then they have grown rapidly. In 1861 postal savings-banks (*q. v.*) were begun. The savings-banks system of France dates from 1818.

In the United States the first savings-bank was organized in 1816, in New York City, tho a savings-bank seems to have been actually opened in Philadelphia before the New York bank was really under way. The first incorporated savings-bank was opened in Boston the same year. The statistics on the following page are from the "Statistical Abstract of the U. S." (1906).

For the growth of savings-banks in the U. S., see article PROGRESS, U. S. Caution, however, is necessary in using savings-banks as proof of the prosperity of the working classes. The *Outlook* said as far back as Sept. 7, 1895:

In the last number of the *Yale Review* Professor Farnam follows the same line of argument as did Secretary Carlisle in his Memphis speech, and attempts to show that the public is mistaken in supposing that the interests of the creditor class are the interests of the comparatively rich. In his argument he lends the weight of his authority to Secretary Carlisle's savings-bank statistics. He says:

"The total deposits in 1890 were \$1,524,844,506, distributed among 4,258,893 persons, making an average of \$358.03 for each depositor. The savings-bank deposits alone represent more than half as much again as the farmers' debt, owned by five times as many persons."

If it is true that there are over 4,000,000 savings-bank depositors among our 12,000,000 families, then it is true that a large portion of our small property owners belong to the creditor class. But the fallacy in this has been repeatedly exposed in official reports. The official reports are for deposits and not depositors. Three millions and a half of the deposits are in New York and New England, where there are only 2,000,000 families altogether, and not to exceed 1,000,000 depositors. But this is not all. The working-class depositors nowhere furnish the bulk of the deposits. The large depositors and the multiple depositors belong to an entirely different class. In Massachusetts, where $\frac{1}{2}$ of the deposits are made in sums less than \$100 (and presumably belong to the working classes), the aggregate of these is only a quarter of the total amount deposited. These conclusions from the Massachusetts investigations are strikingly confirmed by the present investigation in Baltimore. In Baltimore, also, there are more savings-bank deposits than families, yet in Baltimore only one family in three possesses personal capital of any description, while the aggregate holdings of $\frac{1}{2}$ of these is but 6 per cent of the total.

This subject was most fully investigated in Massachusetts as early as 1872: by the Massachusetts Bureau of the Statistics of Labor in 1872, 1873, and 1874.

On returns from 30 banks the report for 1872 (p. 316) found that $\frac{1}{4}$ of the deposits was nearly $\frac{1}{2}$ of the amount in those banks, the remaining $\frac{3}{4}$ depositing only a little over $\frac{1}{2}$. The $\frac{1}{4}$ of the deposits were those of \$300 or over, and it was the argument of the report that since, except in the rarest instances, and under the most exceptional circumstances, no ordinary wage-worker could possibly save more than \$300 a year from his earnings (see WAGES), the amount deposited by that $\frac{1}{4}$, or nearly $\frac{1}{2}$ of the total amount, could not have been deposited by wage-workers. This conclusion was supported by abundant quotations from various reports of the

¹ Figures for New South Wales and Tasmania relate to Dec. 31; figures for the other states to June 30.² Figures for postal savings-banks relate to the end of the calendar year 1904; figures for the other savings-banks to the end of 1903.³ Deposits with the State-controlled Caisse Générale d'Épargne. Includes savings deposits with post-offices. Moreover, accounts are published in the *Annuaire Statistique* of four municipal and five private savings-banks for the year 1904. At the end of that year these nine institutions had 42,279 depositors, credited with \$9,379,623 worth of deposits.⁴ Exclusive of data for the "special savings-banks," the total deposits in which, on June 30, 1906, amounted to \$27,399,194. The total deposits in all savings-banks amount thus to \$89,309,816, making the average deposit per inhabitant \$13.87. This total does not include the savings deposits in the chartered banks ("deposits payable after notice or on a fixed day"), which on Dec. 31, 1906, were \$398,765,182.⁵ Figures for the two savings-banks in Santiago and Valparaíso.⁶ Includes all savings institutions. Figures for savings-banks proper, exclusive of branches of ordinary banks, were 996,615 (number of depositors) and \$160,621,194 (total deposits plus interest due on said deposits at the end of the year).⁷ Not included in the grand total.⁸ Exclusive of population in native states. Data for postal savings-banks only.⁹ Exclusive of 132,009,802 lire of savings deposits with the so-called "Società ordinaria di credito" and 313,407,272 lire with the "Società cooperativa di credito" at the end of 1903. No data are given with regard to number of depositors in these institutions.¹⁰ Data for postal savings-banks and the five principal private savings-banks. Figures for the former are for the calendar year 1905; figures for the latter are for the calendar year 1904.¹¹ Figures for the "Casa de economía" only.¹² Preliminary data for all government savings-banks as published by the *Viestnik Finansov* No. 37, 1906, exclusive of securities held for depositors, the nominal value of which, on Dec. 31, 1905, was \$115,431,000.¹³ Estimates of M. Guillaume Patin in the *Journal de Statistique Suisse*, 1900, No. 4.¹⁴ Year ended Nov. 20 for trustee savings-banks; year ended Dec. 31 for postal savings-banks.

Bank Commissioners of the state, who say, in 1870: "These institutions are becoming still more the favorite place of deposit, not only for persons of small means, but also for those seeking investment for very considerable amounts." Governor Claflin is quoted as saying in his message for 1871: "It is very evident that a large share of this increase is not the savings of labor. Each year shows more deposits by capitalists." Repeated instances were found of men having in each of many banks deposits to the limit of the law. Still more instances were found of one man or woman having deposits under several accounts, as for himself or herself, and as trustees for children, etc., indicating again depositors not of the wage-working class. One man was reported to have a deposit in each bank of the state; another will deposit for each member of his family and a part of the alphabet. From this, and other similar evidences, the report concluded (p. 332): "It is evident from these returns that the great bulk of depositors is from the wage classes, and it is equally evident that the great sums, generally credited to them, are not the savings of wage labor, but are the results of profits upon labor in some form."

This report made somewhat of a sensation in Boston and

in Washington. From the report of 1873 we learn that in Congress, during a discussion of the tariff, certain Western congressmen, opposed to protection, made

use of the report before it had been officially presented to the legislature of Massachusetts, to show that Massachusetts wage-workers were not as well off as was claimed by the protectionists. This incensed some Massachusetts capitalists, and the Committee on Banks and Banking of the Massachusetts legislature, the majority of the committee being connected with savings-banks, undertook to disprove the offensive report. A hearing was called. The Bureau of Labor was invited to come before it

"in order that it might make suggestions"; but, when the hearing took place, the bureau found itself with little or no warning, confronted with a hired counsel who called witnesses from 11 banks to disprove the bureau's report, based on 39 banks, the counsel arguing that the bureau's report was untrustworthy, because it was based on reports from only 39 banks.

The bureau ably defended its report, and demanded that

if the committee questioned its conclusions, it was only fair, before they condemned it, to have a fuller examination, and not condemn, on picked evidence, from 11 banks, a report carefully based on returns from 39 banks. The committee, however, would not hear, and voted the report a mere "matter of inference," and not reliable. The personnel of the bureau, too, was changed that year. Mr. H. K. Oliver (chief) and G. B. McNeill (q. v.), who had formed the bureau publishing the offensive report, were displaced, and Messrs. Carroll D. Wright and George H. Long were put in their places. Before Mr. Oliver and Mr. McNeill, however, were displaced, they obtained evidence from 91 banks and from the Bank Commissioners' reports of 1868, 1869, 1870, and 1871, abundantly sustaining their position. From 91 banks they found and stated (p. 197) that $\frac{1}{4}$ of the deposits were of \$300 or under, i. e., might possibly be deposits of working men, but that these $\frac{1}{4}$ of the deposits represented only $\frac{1}{11}$ of the amount deposited. From the Bank Commissioners' reports they found and stated (p. 227) that in 1868 and 1869 $\frac{1}{4}$ of the whole number of deposits amounted to $\frac{1}{11}$ of the whole amount deposited; that in 1870 $\frac{1}{4}$ amounted to $\frac{1}{10}$ of the whole amount, and that in 1871 $\frac{1}{4}$ of the deposits amounted to nearly $\frac{1}{8}$ of the total amount, thus not only abundantly supporting the former report of the bureau, but showing that the proportion of large depositors in the savings-banks was on the increase.

The next year, 1874, Messrs. Wright and Long sign the report. The subject of savings-banks is naturally handled very lightly, but even according to their table (pp. 244-245) we learn that over $\frac{1}{2}$ of the deposits were deposits of \$300 or over, showing that the number of large depositors was even greater than the former reports had claimed, and that these large deposits amounted to nearly $\frac{1}{2}$ of the whole amount. Five-sixths of the deposits equaled not much over $\frac{1}{2}$ of the whole sum; an abundant proof that the large amount of money in Massachusetts savings-banks cannot be taken to prove the prosperity of the Massachusetts working people.

SAVONAROLA, SOCIAL WORK OF: Municipal reform in Florence in the latter part of the fifteenth century was wrought by Savonarola, a monk who had had no experience in affairs of State. But he had utter disregard for rank and authority and a great passion for the poor and oppressed. Fearlessly he denounced the greed of the priests and derided the assumptions of the rich.

In the scheme of government which he found in operation in Florence changes were brought about by means of *Parlamenti*, a spurious pretense of popular government. The people were assembled unarmed in the Piazza which was guarded by the armed attendants of the Signory. Then the Signory appeared on the balcony in front of the palace and asked the right of Balia for themselves or their friends. The Balia really signified *carte blanche* to do as they chose, for it was a species of dictatorship conferred either for months or for years, a concession which, under the conditions, it was not hard to secure. The Medici were expelled, but there were other tyrants ready to exploit the people.

The Prior of St. Mark's secured the abolition of *Parlamenti* and the establishment of a Great Council on the Venetian plan. This council was not to discuss laws but only to vote them. All citizens were eligible as members provided they had attained the age of twenty-nine years and were *netti di specchio*, i. e., had paid their taxes and were *beneficiati*, which, by the terms of an ancient law, signified those who had been in one of the higher magistracies, or had enjoyed this benefit in the person of their father, grandfather, or great-grandfather. There were other provisions of the new law, but suffice it to say that the council was so restricted as not to make it too democratic.

Savonarola was not an iconoclast, but was constructive and irenic. His passion for the poor did not lead to extremes. His frequent plea to Florentines was: "Forsake pomps and vanities, sell all superfluous things and bestow the money

on the poor." He did not advocate poverty nor ask the rich to strip themselves of all they possess, but only of superfluities. After the liberation of the people, Savonarola secured the establishment of a Monte di Pietà to save the poor from the extortion of usurers. Under his passionate appeals women gave their jewelry and precious stones. To cover the expense of administration from 5 to 7½ per cent interest was charged on loans.

A revision of taxes was also brought about, taxes being levied under the new régime on real property alone. Savonarola insisted on the right of taxation. To the people he said: "Citizens! I would have you steadfast in devotion and help to your commune. The son owes so much to his father that he can never do enough for him. Wherefore I say to you—your commune is your father and thus each one of you is bound to give it assistance. And if thou wouldst say, 'I get no good from it,' know that thou mayest not say this, inasmuch as the commune protects thy property, thy household, and thy children."

In the space of one year the liberty of Florence was established, the people authorized to carry arms, the system of taxation revised, usury extinguished by the Monte di Pietà, a general peace made, justice reorganized, *Parlamenti* were abolished forever, and the Great Council was constituted; in all which Savonarola was the moving spirit. His motive was brotherhood; his power, preaching.

PAUL MOORE STRAYER.

SAY, JEAN BAPTISTE: French political economist; born Lyons, France, 1767. Educated for a commercial career, he spent a part of his youth in England; returning to Paris he worked on Mirabeau's paper, *Courrier de Provence*. Later he was secretary to Clavière, minister of finance; 1794-1800, he edited *La Décade*; he was a member of the Tribunal of 1799. His dissent from Napoleon's policy drove him into private life, and he established a spinning-mill, but after Napoleon's fall was made professor at the École des Arts et Métiers in 1819, and at the Collège de France in 1831. He died in Paris in 1832. Cossa considers him among the first of the continental writers to have appreciated and popularized Adam Smith. Author: "Traité d'Économie Politique"; "Catéchisme d'Économie Politique"; "De l'Angleterre et des Anglais."

SAY, JEAN BAPTISTE LEON: French economist; minister of finance; grandson of Jean Baptiste Say; born in Paris, 1826. He devoted himself to political economy; for many years was contributor to the *Journal des Débats*. Returned to the National Assembly in 1871, he became prefect of the Seine the same year; minister of finance in 1873-75-77, and 1882. In 1880 he was appointed ambassador to London, but returned in a few weeks, having been elected president of the Senate. Author: "Les Solutions Démocratiques de la Question des Impôts"; "Le Socialisme d'État." He edited "Le Dictionnaire des Finances"; and conjointly with Jos. Chailley, "Le Dictionnaire d'Économie Politique."

SCHÄFFLE, ALBERT EBERHARD FRIEDRICH: Austrian political economist; born Nurtengen, Württemberg, 1831. Studied theology at Tübingen, but became professor of political economy there in 1861. Sat in the Württemberg

Landtag from 1862 to 1865; for a short time in 1871 was minister of commerce for Austria. On the fall of the ministry he went to Stuttgart and devoted himself to economics. His "Quintessence of Socialism," translated in 1889, is considered by many one of the ablest presentations of socialism, and is considered by some to show Schäffle a Socialist, which Cossa thinks is scarcely disproved by his latter work, "The Impossibility of Social Democracy." In his "Bau und Leben des Sozialen Körpers," Schäffle, under the influence of Comte and Spencer, outlines a comprehensive plan of an analysis of the social body. He died Dec. 25, 1903, in Stuttgart. Author: "Die Nationalökonomie," third edition of which was published under the title "Das Gesellschaftliche System der Menschlichen Wirtschaft"; "Kapitalismus und Sozialismus"; "Quintessenz des Sozialismus"; "Die Aussichtslosigkeit der Sozialdemokratie." "Memoiren," posthumously, 1904.

SCHIAVI, ALESSANDRO, D.C.L.: Secretary of the Società Umanitaria of Milan; born 1872 at Cesenatico, Province of Forlì, Italy. From 1896 to 1903 on the staff of the chief Italian socialistic paper, *Avanti!* Since that time has been secretary of the Società Umanitaria. Signor Schiavi believes that nothing short of an economical transformation wrought through the slow, unceasing effort of associations of workers, trade-unions, cooperative and political organizations can improve the standing of the working classes. They must daily train themselves to bear the full, enlightened responsibility of the collective system of production which is to replace the present individualistic one. As such an education comes more through things than words, every social reformer must aim to directly pervade the people's life in order that it may spontaneously, surely, tho slowly, be raised to a higher level. To give clean, well-ventilated, gay-looking houses with baths to poor and neglected families is worth scores of lectures or pamphlets. Believes that assistance ought to be limited to those who are already striving to better their condition, as being most likely to profit by it. Private and public beneficence come in, at best, but to complete and perfect the help which individuals and associations afford themselves. Author of reports on unemployment in rural and town districts, and papers on strikes and sundry other economical topics contributed to *Critica Sociale* and *Riforma Sociale*. Address: Via Alessandro Manzoni, 9 Milan, Italy.

SCHMOLLER, GUSTAVE: Political economist; member of the Berlin Academy of Science, the Prussian House of Peers, etc.; born in Heilbronn 1838; student of political science, philosophy, and history at Tübingen; successively professor at Halle, Strasburg, and Berlin. Perhaps the leading German Socialist of the Chair (q. v.), having opened the famous congress at Eisenach in 1872. Since 1881 he was editor of the important *Jahrbuch für Gesetzgebung Verwaltung und Volkswirtschaft*. Best known as one of the leaders of the historical school (q. v.). He began with an essay on economic ideas in the time of the German Reformation, 1860; then approached the modern industrial question in his excellent book, "Zur Geschichte der Deutschen Kleingewerbe im Neunzehnten Jahrhundert" (History of the Smaller Industries of Germany in the Nineteenth Century, 1870); but

he soon changed his line of study, centering his efforts upon a history of the Prussian administration. Portions of this history have appeared as a series of articles contributed to the *Preussische Jahrbücher*, to the *Zeitschrift für preussische Geschichte*, and recently to his own *Jahrbuch*. Besides these works he has published, as a result of a study of the Middle Ages, "Die Strassburger Tucher- und Weberzunft, ein Beitrag zur Geschichte der deutschen Weberei und des deutschen Gewerberechts vom XIII. bis XVII. Jahrhundert" (The Weavers' and Cloth Makers' Guild of Strasburg; a Contribution to the History of the German Weaving Industry and German Industrial Law, from the Thirteenth to the Seventeenth Centuries). This work, consisting of documents and explanations, together with a glossary and index, appeared in 1879. In close connection with these studies, Schmoller has edited a collection of historical investigations by other writers in the "Staats- und sozialwissenschaftliche Forschungen" (Investigations in Political and Social Science), of which 122 volumes have been issued since 1879.

Author: "Der französische Handelsvertrag und seine Gegner," 1862; "Ueber einige Grundfragen des Rechts und der Volkswirtschaft," 1875; "Strassburg zur Zeit der Zunftkämpfe," 1875; "Ueber einige Grundfragen der Sozialpolitik und der Volkswirtschaftslehre," 1898; "Acta Bornssia," published by the Royal Academy of Science, 1894-1907; "Grundriss der allgemeinen Volkswirtschaftslehre," 2 vols., 1900-4. Also numerous articles in scientific periodicals. Address: Berlin, W 62; Wormser Strasse 13; Villa Schmoller.

SCHOOL CHILDREN, PHYSICAL WELFARE

OF: In recent years an increasing amount of attention has been paid to this important question, both in this country and Europe. The provision of school meals (see **FEEDING SCHOOL CHILDREN**) has been attempted much more largely in Europe than in the United States, where, as yet, there have been only a few small experiments of a semiprivate and eleemosynary nature.

Perhaps the most important social work carried on in connection with the public school system is that of medical inspection and supervision. In Europe this has also been carried on to a much greater extent than in the U. S. In Norway and Sweden, for example, children are regularly examined and those needing it provided with medicine and cod-liver oil and other tonics, free of charge. In Belgium medical inspection is regular and thorough in most schools. For example, in Brussels every child in the public elementary schools is medically examined once every ten days. Its eyes, teeth, ears, and general physical condition are overhauled. Medicines and tonics are provided and parents advised as to diet, etc. In France inspection is generally regular and thorough; glasses are provided, often free of charge, for all children needing them.

Until quite recently the medical inspection common to our American public schools was most perfunctory, attention being confined mainly to infectious diseases. Recently, as a result of much agitation, great advance has been made. Now many of the large cities have a much more efficient system of inspection, and visiting nurses attached to the schools visit the homes of the children and care for them. It has been found

that a very large percentage of backward, dull, and refractory children are victims of physical ailments, often unnoticed by the teachers. In one year (1906-7) all the boys sent to the truant schools in New York City were medically examined and physical defects calculated to interfere with a child's capacity to learn or observe school discipline were found in every case.

In several German cities the system of medical inspection is so thorough that, beginning with a child's entrance into the public schools, a record is kept of its physical condition up to the time of leaving. Parents are advised as to dietary and other matters of home care. Children suffering from cardiac weakness, for example, are not permitted to join in violent games, teachers are urged to protect them from violent agitation, they are excluded from the vigorous physical exercises of the school, and parents warned in a similar manner of the dangers which violent games or excessive agitation will expose the children to. Children showing signs of a predisposition to tuberculosis are specially watched, and school sanatoria are maintained in many places for their special benefit.

These school sanatoria are maintained in Norway, Switzerland, France, and a few other countries, the French sanatoria being generally known as *colonies scolaires*, or school colonies. Some of these school colonies are open for all children in certain grades, the children being sent to them for short periods during the summer vacation period. Others are maintained as convalescent homes for school children all the year round, while still others are sanatoria for sick children. The Forest School at Charlottenburg, Germany, is one of the finest in the world and is devoted mainly to caring for children suffering from pulmonary troubles. We have as yet no similar institutions in connection with any of our public schools.

Defective teeth are responsible for a great deal of pain among children of all classes, but especially the very poor. They are frequently the cause, also, of serious digestive troubles which handicap the sufferers through their school life. In a few foreign cities dental clinics have been established in connection with the public schools at which the children are treated free of cost to themselves, teeth being cleaned, stopt, extracted, etc. Strasburg, Germany, has probably carried this work further than any other city. Nothing like it exists in this country, tho there is frequently some agitation in favor of the establishment of such clinics in connection with the schools in our larger cities. In many American cities close attention has been given to the vision of the school children, especially since the publication of some rather startling figures in Minnesota and New York. Glasses are not provided at the expense of the school authorities, however, as is the case in many European cities, tho the proposal to do so has attracted much serious attention in New York and elsewhere.

SCHOOL GARDENS are intended to give city children an interest in the raising of flowers and foodstuffs, and to bring them into contact with nature; or, if in the country, to give them an intelligent view of the processes employed by man and nature in raising crops. This problem has been worked out in Europe long ago. Germany, Austria-Hungary, Belgium, France, have had school gardens since 1875; since 1887 they are compulsory in France.

School gardens supply a definite need in schools; they furnish an opportunity for change of mental activity, for exercise in the open air, and for useful if not gainful employment during vacations in the summer. This is especially the case in large cities whose congested population seems to have no useful outlet for the surplus energy of its poorer children than that found in the street. Owing to this fact, a number of cities in the United States have taken up the problem with vigor and intelligence, and have succeeded in getting the city authorities and private citizens interested in the cultivation of vacant lots and other open spaces by children. Boston, New York, Hartford, Philadelphia, Washington, St. Louis, etc., have had considerable success in this field.

Cleveland, Ohio, has taken up the problem through a Home Gardening Association which induced the school council to provide space and proper soil, while they furnish seeds, tools, and expert gardeners. The reports emphasize the mental and moral betterment in backward and untractable children, and the physical improvement in weak ones under the influence of school gardening.

SCHOOL QUESTION IN GREAT BRITAIN: We study this question from two standpoints. (See also RELIGION IN PUBLIC SCHOOLS.)

I

(FROM THE CHURCH OF ENGLAND POINT OF VIEW)

There are many subjects deserving of earnest consideration in connection with education in Great Britain at the present time, i. e., since July, 1906; but the one "schools question" which overshadows all others in interest is that of the position and the quality of the religious instruction to be given in the elementary schools of England and Wales in the future.

A brief historical retrospect is necessary in order to explain how this question has arisen. The active intervention of the State on an extensive scale for the furtherance of the education of the people is, in England, of comparatively recent date. In varying degrees that work has always been recognized as part of her duty by the Church of England, both before and since the Reformation. It is enough here to refer to the fact that between 1685 and 1741 nearly 2,000 "charity schools" were established by Churchmen, and conducted, mainly, in connection with the venerable Church Society for the Promotion of Christian Knowledge which was founded in 1698. In 1785 the Sunday-school Union was founded, consisting of both Churchmen and Dissenters, and exerted itself with such good effect that by 1803 more than 7,000 Sunday schools had been established and were giving instruction in reading and Christian rudiments to nearly 850,000 children. But, of course, schools meeting only one day in the week could not carry

education far, and a very great need existed of educational provision for the rapidly growing population. In 1808 and 1811, respectively, there were founded the British and Foreign Schools Society on undenominational lines, and the National Society for the Education of the Poor in the Principles of the Established Church. For more than twenty years these societies were the principal agencies working for the education of the masses; but the scholars in church schools very greatly outnumbered those in other schools. In 1833 government recognized the great value of the work then being done by voluntary zeal and began to make building grants in aid of its extension, and in 1846 there began the system of State grants in aid of the maintenance of elementary schools, by whatever voluntary agency established, on condition of their satisfying requirements prescribed by the Education Department for securing the efficiency of the secular education given. This system of what may be called State partnership with the religious denominations in the work of elementary education continued under somewhat varying conditions, into which there is not space to go here, till 1870. At that time there existed in schools under government inspection places for 1,365,080 children provided by the Church of England, 411,948 in undenominational and Non-Conformist, and 101,556 in Roman Catholic schools. The provision was ample in great numbers of rural parishes and fairly adequate in very many town parishes, but not so in the thickly populated and growing urban districts. Parliament, therefore, decided that steps must be taken by the establishment of school boards to make the supply universally sufficient. The emphatically declared object of Mr. Gladstone's cabinet, which passed the Education Act of 1870, was to supplement and complete, not to destroy, the work of the voluntary system, to the supporters of which ministers express the greatest sense of obligation, while inviting and encouraging them to continue their efforts. The invitation was accepted. Down to 1870 there had been expended on church school buildings £8,750,000. Since then there has been expended about £14,000,000, making a total of £22,750,000. If from that figure we deduct £1,500,000—the total amount of government grants, the last of which were passed more than twenty-five years ago, toward the erection of these buildings—there remains £21,250,000 as the total of voluntary contributions to the buildings of church schools alone. Toward their maintenance before 1870 £8,500,000 was contributed, and from that year to 1901 £18,145,558. These figures yield an aggregate of voluntary expenditure on church schools of £47,895,558, not counting very large sums contributed for the building and maintenance of church training colleges for teachers.

The above figures show on its material side the obligation of the State to the Church in respect of elementary education. It may be added that in 1902 there was accommodation in church schools for 2,813,978 children. But the cost of education had in the mean time increased enormously, having risen from £1.5.5 in 1870 to £2.13.2 in 1900, and the voluntary schools in many parts of England found it more and more impossible to maintain themselves against the competition of the board schools enjoying free access to the rates. So in 1902 the unionist government determined and Parliament agreed that this unfair

competition was bad for education and that the two classes of schools should share equally in the school rate. But the act passed in that year, which made county and borough councils the school authority, placed the secular instruction in the voluntary schools entirely under that authority. Also, while leaving to their managers the right—subject to veto by the council on educational grounds—to appoint teachers, and so to secure that the religious instruction should be carried on in pursuance of the terms of the school trusts, the Act of 1902 attached a representative element to the Board of Managers, and required the managers to continue responsible for keeping the school buildings in good repair.

This act made the state of the law much more just and the provision for education much more satisfactory than before. Its main defects were that it did not make any provision, such as very many churchmen would have been willing to agree to, for Non-Conformist minorities in country districts with only one school; and that on the other hand it left so-called undenominational religion, which satisfies Non-Conformists generally but is very unsatisfactory to very many church people, the one form of religion taught at the public expense in the council schools. These, however, were not new hardships.

The bill recently before Parliament would do new injustice on a great scale and would strike a heavy blow at religion. In order, professedly, to secure more complete control over all schools to the popular authority and to "abolish tests for teachers," it would—subject to exceptions of very doubtful extent and value—take away from church parents the right of having their children brought up in their own faith by the regular teachers of the schools to which they are compelled to send them, and would insist that in the schools built and maintained, as has been shown, at such great cost by church people for the teaching of their faith as an integral part of the education given, undenominational religion shall be the recognized and established form. This would be a gross and scandalous injustice. The Government Bill also proposed that religious teaching of any kind shall be optional with the teachers and that the children need not attend when it is given. It is held that these proposals, involving the degradation of religion from its rightful position, tend obviously toward secularism and threaten England with all the social and moral evils which have notoriously resulted in other countries from the secularization of schools.

The bill which was pressed upon Parliament by the Liberal government in 1906 would, in the name of justice, have inflicted new injustice on a great scale, and would have struck a heavy blow at religion. In order, professedly, to secure more complete control to the local authority over all schools and to abolish "tests for teachers" it would—subject to exceptions of very doubtful extent and value—have insisted that even in schools built and maintained at great cost by church people for the teaching of their faith as an integral part of the education given, undenominational religious teaching should be the recognized and established form. This would have been a gross and scandalous injustice.

There was a wide-spread and emphatic demonstration of public disapproval of the bill of 1906. This demonstration was ignored by the
